CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 262. NEW SERIES.

SATURDAY, JANUARY 6, 1849.

PRICE 1½d.

AN ENGLISH WORKMAN'S RECOLLECTIONS OF PARIS IN 1848.

At the close of the year 1847, want of employment, coupled with the information that the particular branch of my trade in which I was mostly employed was unknown in Paris, induced me to leave my wife and four little ones in our native village near the western suburbs of London, and set out for the French metropolis. My voyage, which was a stormy one, was marked by nothing of importance besides my forming an acquaintance with a young sailor named George Barges, who, being of French extraction on the father's side, had friends in Paris whom he was now to visit after a separation of eighteen years. My conversation with this young man in the vessel and in our Boulogne hotel led me to feel a deep interest in him; and finding that his finances were low, I offered him the loan of a sovereign, which with some difficulty he accepted. We arrived in Paris together at six o'clock on New-Year's morning, and drove to the residence of my companion's brother, in an upper floor of a large house in the Rue de la Harpe. I was kindly received by the family, consisting of James Barges, a young *ouvrier*, of handsome figure, but a strong dash of melancholy in his countenance; and his wife, a delicate-looking person, who, like himself, spoke good English. It being a fête day, James dressed himself in his best clothes, and conducted us to some of the gayest scenes in Paris, as the garden of the Luxembourg, and the Champs Elysées, with all of which I was of course much pleased.

We returned in the evening to dinner, when I found a party assembled for the purpose of merrymaking. My host introduced me to M. Vachette, his brother-in-law, whose wife, I gladly found, could likewise converse in the English tongue. It was afterwards explained to me that the two sisters were the daughters of a deceased gentleman; and that, after vainly endeavouring to support themselves by tuition, they had been fain to avail themselves of offers of marriage from a couple of honest workmen. These men, however, found that elegant accomplishments, such as music, painting, and language, but badly compensate for the more homely ones of cooking and cleaning.

The evening passed very cheerfully away, and the kind-hearted James insisted upon my spending a few days with him, while a lodging was prepared for me at his brother-in-law's, M. Vachette, who resided in the Battignolles. In the course of a few days I removed to my lodgings, and then set out, in company with George, in quest of what had brought me to Paris—employment. The first few days we met with no success, it being difficult to convince the French dyers that the English way of finishing was superior to their own. At length, when I had almost despaired of ob-

taining any employment in Paris, and was seriously meditating my return to England, we fortunately entered the shop of Messrs Jolly and Blanc, in the Rue St Martin.

Finding one of the partners within, I exhibited my book of patterns, which seemed to take his eye very much. He asked me a few questions, and then gave me something to do, by way of obtaining a specimen of my work. I returned with it the next day, and was at once engaged at 30 francs [about 24s.] per week, with promises of an advance being made as work became more plentiful. The next day I entered into my new occupation, and found myself an object of no small curiosity to my fellow-workmen, and no small diversion to a bevy of young girls and workwomen at work in an adjoining room; but all were courteous and obliging, and I never was subjected to those cruel mockeries and insults to which we too frequently subject the unfortunate foreigner whom chance may throw among us.

In the establishment of Messrs Jolly and Blanc there were employed nearly sixty individuals, the greater number being females, as, from the low wages given in Paris, it would be impossible to maintain a family without the joint labour of both man and wife, who therefore know but few of the comforts of domestic life as compared with us in England. The meal times in this establishment strangely varied with those in England. We commenced work at six in the morning, and went to breakfast at eleven. At the expiration of one hour, labour was resumed until seven in the evening, at which hour work for the day was done, and we all went to dinner, and for my own part with a very good appetite. I am not disposed to set this system up as an example, as I am convinced, from experience, that nature requires recruiting more than twice a day, when a person's occupation is at all laborious. I am disposed to come to the conclusion, that the employer loses in the end when wages are not sufficient to procure the necessary food to keep up a man's stamina. I am sure, from actual observation, that ten Englishmen would perform the work of fifteen Frenchmen in the same space of time. Doubtless the reader may think me rather prejudiced; but I am ready to admit, at the same time, that my countrymen, with the same quantity and description of food, would perform even less work than the Frenchmen.

It was my custom to take my *déjeuner*, or eleven o'clock breakfast, at a *cuisine bourgeois* in the Rue Royal, close by the Rue St Martin, where I had ample opportunity of making observations on the mode of living usually adopted by the Parisian workpeople, as the house was much frequented by that class, being the cheapest in the quarter. The *déjeuner* usually consisted of a basin of very poor soup, with a spoonful of any vegetable that you might choose to have put into it,

doubtless to impart a richness to the appearance, if it did not add much to the flavour. For this dish the charge is two sous: after which it is usual to have some very doubtful beef, with a few more vegetables, the charge being four sous; and then, indeed, if money is plentiful, you may indulge in a glass of wine, or some dried fruit, cooked or not, according to taste, for two sous more. It is worth remarking that all the wine and spirituous liquors are very cheap in Paris; the chief drink of the poorer classes is water to both breakfast and dinner, some few mixing with it a little wine. The dinner consists of nearly the same, with little variety, unless you choose roast meat instead of boiled. At both meals it is customary to eat a large quantity of bread.

The Parisian workmen take much more pride in their appearance than the English. It has been the subject of notice with many that few untidy or ragged persons are to be met with in the streets; and I observed that most of my fellow-workmen kept a working suit at the factory, which they changed night and morning.

I soon became accustomed to manners and habits which had been at first rather strange to me. I found my master very kind and affable with all his work-people, treating them more as his equals than his dependents; and I think in return he enjoyed the respect and esteem of all who had the happiness to serve under him. The whole of the people in his establishment seemed to live on the best of terms with each other, and all were kind and obliging to me. The laughter of light hearts, and the merry song, sounded loud and often through the factory.

The first few weeks passed pleasantly enough. Monsieur and Madame Vachette did all that lay in their power to render my situation at their home comfortable; and from the kindness of Madame Vachette, who had once been a teacher of the English language, I soon made considerable progress in my French studies. My evenings were chiefly spent in company with my friend George, at the lodgings of his brother, who always received me with the greatest of hospitality—sometimes, I was even fearful, with more than their limited means justified. The frost at this time was very intense, the Seine being in some places completely blocked up with ice. Towards the middle of February the weather became mild and genial. Trade, which had received some check from the frost, began to revive. I found full employment for both time and money, as it was necessary that part of my wages should go towards the support of my little ones at home.

It was about this time that I first heard of the proposed banquet, the forbidding of which ultimately cost Louis Philippe his throne, and led to much bloodshed and disorder. On the ever-memorable morning of Tuesday the 22d of February, I was proceeding as usual to my employment, when on reaching the Boulevards, I found groups of workmen and others reading the official proclamation prohibiting the meeting. The crowds seemed very much excited, and gave vent to their feelings in loud and angry exclamations. At the guard-house, instead of the one solitary sentinel, the whole front was occupied by the military, all armed and ready to act at a moment's warning. On reaching my place of work, I found those who had arrived before me clustered in groups, discussing the probable events of the day.

Nothing of any note attracted my attention during the morning, beyond vague and contradictory reports of conflicts between the troops and the people. At eleven, I went as usual to breakfast, when I was somewhat startled by observing a large tumultuous assemblage enter Rue St Martin from the Boulevards. The foremost, who was an *ouvrier en blouse*, bore a piece of red cloth on a staff, as a substitute for the terrible *drapeau rouge*, and for the first time I heard the French *vive*—'Vive la Réforme!' The progress of this mob, although unmarked by any species of wanton outrage that I could observe, spread consternation and alarm through all the neighbourhood. I was somewhat amused

by observing a perfumer who lived nearly opposite removing, with all possible despatch, the royal arms from the front of his shop.

On returning to my work, I found the shop closed, and all the workpeople departed, as now indeed were all the shops in the street. On reaching the Boulevards, I found everywhere immense assemblages of people, and great excitement. The shops were closed the whole length of the Boulevards, from the Porte St Martin to the Madeleine, and thousands of heads protruded from the windows, all very evidently expecting a something to confirm or ease their apprehension. I proceeded down Rue Royal to the Place de Concorde. Here I found a strong military force of horse and foot. I next visited the Rue St Honoré. Here things wore a more serious aspect. Some omnibuses and cabriolets had been overturned in several places, the stones had been removed, and an attempt made to form a barricade.

A troop of dragoons were employed to keep the mob from assembling together. They used the flat of their swords, with no very great delicacy of touch, on all who chose to disobey their commands. Much ill-feeling here exhibited itself between the soldiery and the people. The noise of drums now struck my ear: it was the *rappel* beating for the Garde Nationale, strongly guarded both in front and rear. A number of young men and boys followed, singing the 'Marseillaise' and 'Mourir pour la Patrie.' Finding the angry feeling far from subsiding, I deemed it most prudent to return homewards; so made the best of my way to the Battignolles.

The next morning I found but few shops open. The guardhouses along the line of the Boulevards, and especially by Portes St Martin and St Denis, were occupied by strong detachments of troops. On reaching my workshop, I found but few of the hands assembled for work. The shop, however, was opened, and I began my daily occupation. It was between nine and ten in the morning that my attention was attracted by a strange hubbub and confusion in the courtyard, immediately under my window. Several persons rushed in from the street, evidently in a state of great terror and alarm. The porter of the house immediately closed the outer gates of the courtyard. Doors were opened and slammed with great violence; the sound of many footsteps hurrying to and fro, the quick shutting of windows, and the hum and confusion of many voices, produced a strange din.

Presently a young girl, who was usually occupied in the front shop, entered my room, and with hurried accents begged that I would assist in shutting up the shop, as most of the men were absent. On descending into the street for that purpose, I found the people running in all directions, pursued by a troop of mounted municipal guards, who laid about them with their swords without mercy. I had scarcely closed the last shutter when the municipals reached the spot opposite our shop, and I was glad to make a hasty retreat. When the shop was secure, I went to work again, the noise still increasing: drums beating, men shouting, women screaming, with crashing of timber, and breaking of glass. But presently I heard the sharp crack of carbines, with louder cries and screams, mingled with yells of defiance and savage imprecations. Gradually the noise became fainter, and soon all was pretty quiet.

Finding all my fellow-workmen were gone, I was reluctant to continue alone; and my curiosity being somewhat excited by the occurrences of the morning, I struck work, and descended into the street, which I found now completely deserted, except by the military; strong detachments of which held it at both ends. They allowed me to pass through them into Rue Royal, where I found the mob had constructed a barricade, which the soldiers were now busily employed in destroying. A vast crowd occupied this street, and all the streets adjoining. Many of them were armed with such weapons as most readily came to hand—as thick bludgeons, pitchforks, hatchets, and sledge-hammers.

Bars of iron wrenched from railings were general; but I observed several with muskets and pistols.

A few paces farther on I saw a crowd surrounding some object on the ground, and singing the eternal 'Mourir pour la Patrie.' On looking through the throng, a melancholy spectacle presented itself: extended on its back lay the corpse of a young man covered with mud and gore.

The people seemed very much excited, and I momentarily expected to see a renewal of hostilities. The turmoil, however, had not taken away my appetite; and I knew, from certain inward signs, that the breakfast-hour was either at hand or past. So, after some hard knocking, I induced Monsieur Macqurie, mine host, to open his door, and prevailed on him to allow me to breakfast. On attempting to return up the Rue St Martin, I was repulsed by point of bayonet, so I passed through a short passage which connects it with the Rue St Denis. This I found also occupied by troops. I gained the Boulevards by another route. On arriving at the guardhouse of the Boulevard des Bonnes Nouvelles, I saw a mob advancing with drums beating in front and flags flying.

There was a strong body of the municipal guards at this spot, with a regiment of the line. The soldiers formed right across the Boulevard, and seemed determined to resist the approaching multitude, who, by their glittering bayonets, appeared well armed. The head of the column halted; a short consultation was held, and then the column wheeled off, crying 'Vive la Réforme,' and singing the never-dying 'Mourir pour la Patrie.'

I had promised on the Sunday evening previous to visit my friend George at the apartments of his brother, M. Bargues, in the Rue de la Harpe; and as I had a wish to know how matters stood in that quarter, I determined to keep my appointment. Accordingly I proceeded thither by the way of the Rue Poissonniere, crossing the Seine at the Pont Neuf. I observed a sharp fusillade going on at Pont au Change, the next bridge, while troops were crowding to that point from every direction. The firing soon ceased, and the people gave way. At this moment a fresh body of military, who, by their appearance, had just entered Paris from some distance, passed along the *quais*. They consisted of lancers, dragoons, and horse artillery, with riflemen, and several regiments of the line. Both men and horses seemed dreadfully fatigued, being covered with mud, looking wet and miserable.

All the bridges and quais were swarming with troops—light horse, dragoons, and cuirassiers—who were incessantly employed in dispersing the numerous groups, who took every opportunity of assembling together, and venting their displeasure in loud outcries against the ministry, mingled with 'Vive la Ligne!'—'Vive la Réforme!'—'A bas Guizot!'

On reaching the apartments of M. Bargues, in the Rue de la Harpe, I found my landlady, Madame Vachette, there, in great anxiety respecting her husband, from whose well-known republican principles she dreaded some harm would befall him.

James, who was a thorough Communist, spoke in raptures of the approaching struggle, but lamented the blood that must necessarily be spilt before France could break the chains that bound her liberties. Like the best part of those misguided men, he thought the wild theories of Socialism and Communism capable of affording lasting happiness and prosperity to all the human family, and worthy of any sacrifice for their promotion; although I am sure no one possessed a better heart, nor more of the milk of human kindness, than James Bargues; showing how fearfully a false philosophy may distort the best of natures.

His brother George not being within, I offered my protection to Madame Vachette in our way to the Battignolles, as we should have to pass through the thickest of the tumult; the Battignolles being about four miles distant from the Rue de la Harpe. On reach-

ing the Quai de l'Ecole, an officer, dressed in a general's uniform, mounted on a superb horse, halted before a crowd who had assembled there; taking off his hat, he bowed to the populace, and then cried in a loud voice, 'The ministers are changed!' This was received with acclamations, and seemed to give universal satisfaction; at least so far as my own observations went.

On reaching my home in Rue de l'Ecluse in the Battignolles, everybody seemed anxious for information respecting things in Paris; and all now fondly hoped, as the Guizot ministry were fallen, that the disorders would quiet down.

After dinner, it being rather late, for we had waited the coming of M. Vachette, I was engaged in writing a letter to my friends, when George entered and informed us that the people were storming and destroying the Barrier Clichy, an office in the wall of Paris, where the *octroi*, or duties on provisions, are collected on their passing into Paris. I ran down into the street, when I heard tremendous firing in the direction of the Boulevard des Capucines. Three distinct volleys followed each other in rapid succession. The people in the streets stood still amazed. All inquired, but none could tell the cause that led to the firing. I ran through Barrier Clichy, which I found in the possession of the people, and then down Rue d'Amsterdam towards the Madeleine, and on reaching the Boulevard des Capucines, I found all in uproar and confusion; people were hurrying to and fro uttering cries of vengeance. The soldiers had fired on the mob before the Hotel of the Minister of Foreign Affairs, and great numbers were killed and wounded. Two men were carrying the body of a female in their arms; her long hair hung down wet with blood; some others placed the dead in a cart, following it with torches and iron bars, which they had torn up in their fury. They formed a sort of procession, their numbers augmenting every moment. A wild frenzy seemed to animate them. As they proceeded onward, numbers sung, in a low mournful strain, 'Mourir pour la Patrie;' but soon the song of death was chanted to a wild cry for vengeance, 'Mort à Guizot!' 'Vive la République!'

Leaving this column to pursue their mournful march, I returned to the Barrier Clichy by the Rue de la Chaussée d'Antin, and in the Rue Clichy every lamp was broken and extinguished; all the shops closed; and it presented a singular contrast, by its loneliness, to the scene that was now going on in the Boulevard. I had just reached the Barrier. A mob, composed chiefly of young men and boys, armed with clubs and axes, came through: they halted opposite a gunsmith's named Rozvy, in the Rue Clichy: in a few minutes the door and shutters were dashed in, and all the arms plundered. They were engaged in distributing the guns, swords, &c. among themselves, when the sound of horses' feet at a sharp trot came from outside the Barrier, and I could distinguish through the gloom the form of an officer, followed by two dragoons, galloping down the street. Crack—bang—bang went several guns at their heads; with what effect I did not observe, as the night was very dark. The sound of a bullet whistling through the air at no great distance from my head made me think it most prudent to beat a retreat; so I returned to my lodgings, where I found my landlord had arrived before me, and thus allaying his wife's fears for his safety.

I retired to bed, and, strange to say, slept soundly. I awoke about my usual time, dressed, and descended into the streets, more with the intention of gratifying my curiosity than the idea of being able to get to my work.

At the Barrier I found a regiment of the line on guard: I passed through them to the Rue Boulogne, when I beheld two men beating the *rappel* on their drums, followed by about twenty others *en blouse*, with guns. As I proceeded farther into Paris, I heard drums beating in all directions, bells tolling, and the sound of the pickaxe and crowbar. At the church of our Lady

de Lorrette, the people were dragging down the iron railing in front, and removing the stones in the street.

Proceeding onwards, I saw barricades forming about every hundred yards right and left of me. A captain of the National Guards endeavoured to persuade them to desist; but they refused. The *rappel* was beating in all quarters: everywhere National Guards, singly or in parties, were hastening to their places of rendezvous, clambering on the best way they could, for march they could not, the road was now so dreadfully cut up. I would beg my reader to imagine Cheapside in London strewn with broken glass, bottles, pots, and iron railings, diligences, omnibuses, carts, wagons, wheelbarrows, and watering-carts, planks and scaffold-poles, with ladders, barrels, buckets, and articles of household furniture, in fact everything a mob can lay their hands on; and they then may form some notion of the scene which all the principal thoroughfares in Paris presented on that day.

On reaching the bottom of the Rue du Faubourg Montmartre, I was stopped by the people, who were constructing a very strong barricade, and desired to assist. This I had no particular wish to do, as I knew not how long before it might be the scene of a sanguinary struggle. The method pursued in constructing these street defences was nearly in all cases the same. Where any street vehicles could readily be obtained, they were used in preference to other materials; but as these things were now nearly used up, the mob had no resource but that of paving-stones.

A band of labourers formed line across the street, with crowbars, pickaxes, or bars of iron, with which they loosened the stones. These were rapidly taken up by another line, who passed them on to a third, and so on to the barricade. By these means a barricade was formed in an incredibly short space of time. My station being nearest to the barricade—for they had selected me, on account of my being taller than most of them, to place the stones on the top—I took the opportunity of passing over to the other side, and finally gave them the slip.

On reaching the Boulevards, I found all the fine trees cut down, and placed across the road. Everywhere were traces of the destructive activity of the preceding night. Advancing towards Porte St Denis, I passed a very large body of troops. Dragoons dismounted, standing by their horses; troops of the line, with their scarlet trousers covered with mud; riflemen in their dark-green uniforms; and artillery standing by their guns. With the exception of the military, I was alone on the Boulevard, and the sound of my own footsteps sounded painfully on my ear; for the silence of death reigned amidst thousands, all standing still and motionless as statues. A long line of watch-fires were smouldering, round which they had evidently bivouacked; and the men looked pale and spiritless with excessive fatigue. At the farther extremity of this body of soldiery were placed several pieces of cannon, pointed towards Porte St Denis. My heart sunk within me, and tears started in my eyes, as I thought how soon they might be used in the destruction of my fellow-creatures. I never shall forget the sensations those murderous engines of war occasioned within me.

After passing these troops, and arriving at Porte St Denis, I found an enormous barricade. I climbed over, and was made prisoner in an instant. Again I was set to work, as they were forming four massive barricades at this point—one across Rue St Denis, one in the Faubourg, and the two others across the Boulevard. My condition at this moment was not to be envied: surrounded by savage-looking men, armed to the teeth, in the midst of four stone walls; while opposite the one on which I was employed several pieces of cannon were planted. Their murderous-looking muzzles, crammed with grape, ready in a moment to pour destruction on all opposed to them, made me feel anything but comfortable.

At this work I was kept, as nigh as I can guess, about four hours, lifting great stones above my head. At length I sank down upon a heap of stones, perfectly overpowered by fatigue, although my fellow-labourers worked on with undiminished zeal. Perhaps I did not enter into the spirit of the thing so much as they did, for I never shall forget the activity displayed by all classes. The man of evident wealth, in morning-gown and slippers, worked side by side with the labourer in blouse and sabots. All seemed actuated by the same indomitable zeal, and perfect order and good-will seemed to exist among them.

A respectably-attired individual came up to me and inquired in a compassionate tone if I was not fatigued. I showed him my hands, torn and bleeding, my heated brow dripping with perspiration, and my soiled and muddy dress. He entered a wine-shop, and gave me a bottle of wine and a small loaf, which I very thankfully received, and quickly devoured.

Presently I heard a great beating of drums, and on looking over the barricade, saw a body of military approaching from the Faubourg, their glittering bayonets extending as far up the Faubourg as I could well see.

The barricades were manned in a moment, and my heart beat furiously within my bosom. I thought of England, of home, my pretty cottage, my wife and four little ones. I cast a despairing look around, but no chance of escape this time. Still the drums advanced, beating thunders, and then the troops halted; the noise of the drums ceased, and then came a moment of intense excitement. A parley took place between the troops and the people. One orator spoke at great length, and evidently very much to the purpose, although I could not understand half of what he said; but it ended by the soldiers giving up their arms to the people. This was scarcely finished, when another body of National Guards came up. A National Guard, who was with the people, stood on a broken pillar, and waved his hat on the point of his bayonet. The men came rushing over the barricade, and boldly fraternised with the people.

The mob, now mingled with the National Guards, formed line on the Boulevard between Porte St Denis and Porte St Martin. Nearly all now had muskets, although many were armed with every species of weapon. Some had evidently furnished themselves from the theatres and old curiosity shops; some were armed cap-a-pie, like the knights of old; some with Indian war clubs and tomahawks. Among other things, I recognised a very large sword which I remembered seeing exposed for sale as the sword of the executioner of Paris.

A cry now burst from many lips of 'Aux Tuileries! Aux Tuileries!' They formed column, with drums at their head, and began a scrambling march over the numerous barricades down Rue St Denis.

I had read, when a boy, of the awful and sanguinary struggle attending the taking of that abode of royalty; and so, suffering my curiosity to get the better of prudent fears, I followed the throng, who advanced beating their drums, and roaring in chorus the 'Marseillaise,' particularly the words, 'Aux armes, citoyens!' varying it, however, with the eternal 'Mourir pour la Patrie.'

They took the direction of the Tuileries, by the way of Rue Thievenot, crossing Rue Petite Carreau, to the Place des Victoires. At this place they halted, in order to induce a body of National Guards assembled there to join them.

There was here a general inspection of the revolutionary irregulars. Those who had no ammunition were supplied by those who had: a captain of the National Guard took the command; the revolutionary forces formed line, and marched and countermarched round the place. They were now a formidable-looking body—truly picturesque in their blouses and caps—their beards and savage-looking moustaches adding much to the effect, with their now half-military costume, for several wore dragoons' helmets, or the steel cap of days long past. The masquerade rooms had

evidently supplied much to the adornment of many of this motley assembly.

Now again thundered the drums, and again a thousand voices roared the 'Marseillaise,' commencing with 'Allons enfans de la patrie;' but many preferred beginning with the finish, and shouting at the top of their voices 'Aux armes, citoyens!' and by way of variety, gave a few lines of the 'Chor des Girondistes'—

*'Mourir pour la patrie,
C'est le sort le plus beau, le plus digne d'envie!'*

for they seldom got over those lines.

'Aux armes! Aux armes! Aux Tuileries!' shouted a thousand voices; and so to the Tuileries they went, and I followed.

On reaching the back of the Palais Royal, a short street separated me from the main body of the insurgents, when suddenly I heard the discharge of a single gun, and then another, and another. This was succeeded by a dead silence; and the few persons who were in the street stopped short, and turned pale, as I daresay I did myself. This lull of a few short moments was succeeded by a deafening roar, produced by the discharge of some hundreds of muskets, with a proximity so close, that the smoke whirled in white wreaths over my head. At this moment a youth, who could not screw his courage to the shooting point, proffered me his gun. I politely declined the offer. Then succeeded an irregular firing, which gradually increased in strength every moment. Then another, and another heavy discharge, fully convinced me that the people were engaged in regular battle with the military.

Gradually the excitement overcame my fears, and my pulse, though quick, beat more regularly. Wishing to obtain a view of the action, I passed into the Rue de Valois, formed on one side by the Palais Royal. At the end of this street the people were firing over a barricade, at what or whom, the volumes of smoke prevented me seeing. One party, with sledge-hammers and crowbars, were busily engaged in forcing the iron gates of the Palais Royal, while others amused themselves by breaking the plate-glass windows with stones and oyster-shells. The lower windows, which were defended by strong iron bars, were battered in, bars, stonework, and all, and the mob entered. This part of the building, I imagined, must have been used as a store, from the immense quantity of wearing apparel that was thrown out and burned in the street. From one window was thrown an immense quantity of bedding, which was likewise heaped on the flames, until the heat became insupportable, and the smoke all but blinding. Some, indeed, set fire to the building itself, which others extinguished, much, however, to their own personal risk.

As the fighting continued, I lost all sense of danger, and soon found myself close to the barricade which ran across the Rue de Valois, from the Palais Royal to a wine-shop opposite.

On looking across the square in which stands the façade of the Palais Royal, I found that the firing on the part of the military proceeded from a guardhouse called the Château d'Eau. On a terrace that ran across the front of this building were stationed three ranks of municipal guards, while immediately below them stood a body of the troops of the line, the whole joining in keeping up a constant fire.

The scene at this moment was one of great excitement. The flash! flash! of the musketry through the white smoke from the terrace and every window of the guardhouse, the beating of drums, waving of flags, and brandishing of swords and pikes, all conspired to deaden the sense of danger, although the sound of the balls striking the barricade, or whistling over my head, bade me remember that I was witnessing a real battle.

As yet I had seen no one hit on our side of the barricade; but suddenly a young man who stood rather above me on the barricade fell backwards among the stones and rubbish at my feet. His teeth were firmly

fixed in his under lip, and his eyes distorted by a fearful squint. In a moment the blood came bubbling through a small purple spot in his forehead, and his features were soon covered with the sanguine dye. His white shirt was also soaked with blood, which ran in a puddle among the broken stones. He was soon picked up and carried away, and I could not refrain my tears at the sight.

In a few moments another fell, shot through the shoulder. His gun fell from his hands; and then what possessed me I do not know, for my excitement was more than can be well imagined, but I had taken the gun of the wounded man before I had given myself a moment's time to consider, and immediately bang went my piece over the barricade! A Garde Nationale supplied me with some cartridges, and from that moment I took my place among the defenders of the barricade.

Although I could never boast of a great share of courage, yet at this moment all thoughts of danger, of home, wife, children, were all forgotten in the fierce delight of battle. It was like skating on very doubtful ice: we all know it is dangerous, but yet all think they will escape the drowning.

The battle began about twelve o'clock, and it was now nearly one. The people had now possession of the Palais Royal, and the houses on the other corner of the street, from which they fired on the troops below.

Some fought very bravely, standing on the top of the barricade, loading now, firing then. Others, almost on their hands and knees when under the barricade, would rise up and fire, retiring to load. Some indeed stood at the corner of a street some distance up, and fired off their pieces there, which greatly added to the danger of those who held the barricade.

Every time the soldiers fired very heavily, a panic would seize some of the combatants, and these would make off, to take up a safer position high up the street. A little man, who was armed only with a sword, behaved very bravely. He rallied the faint-hearted, stamped and swore, and, followed by a few as desperate as himself, leaped over the barricade. They were received with a deadly discharge, and many a poor fellow rolled over in the mud. The few who were left standing came rushing over the barricade. A panic seized the rest, and some ran out of the street altogether.

But although foiled in their first attempt, again they rushed over the barricade, again to meet with the same repulse, and many with their deaths. It was now indeed a hideous scene. The dying and the dead lay heaped together in pools of blood. Their shrieks and groans rose into the air, mixed with the frantic yells and horrid imprecations of the mob; the muskets kept up a deafening roar, and their red flashes streamed incessantly through the stifling sulphurous smoke. The faces of the combatants were distorted with rage, and many fought on, mangled and bleeding, till they could no longer stand to load and fire.

About this time an officer, whom I afterwards learned to be General Lamoriciere, rode into the square: both horse and rider rolled instantly into the mud. The general rose wounded, I believe, and made his escape.

A captain of the Garde Nationale, the same I think who first led the insurgents, now stood on the barricade waving his sword, and inciting the mob to charge. He was shot through the body, and fell on the other side. But the mob rushed from three barricades at the same time, two being across Rue St Honoré, and engaged in deadly combat, hand in hand, with the soldiers. A deadly discharge came from every window of the post, while louder yells, and cries of agony and rage, mixed in wild and savage din with the unceasing roar of the guns.

As I did not choose to pass over the barricade myself, I could not well distinguish what was doing at this moment, from the mingled forms of the combatants, and the blinding smoke from a quantity of straw, which, plundered from the royal stable, was on fire in front of the guardhouse. Several men passed me with trusses

of straw, and one carrying a large copper vessel filled with oil. At once the dreadful truth flashed across my mind: those human fiends intended to burn the wretched soldiers with their guardhouse. To aid this human sacrifice, the royal carriages were dragged out, and one after the other fired, until at last seventeen gilded carriages stood burning in the square, with an insufferable stench, in one costly conflagration.

The noise of the firing, which had for two hours continued without intermission, now became fainter. I passed over the barricade, and was horror-struck on perceiving the flames rushing from every window of the Château d'Eau, and mounting high above the roof. A few scared and desperate wretches rushed out on the terrace shrieking, and were shot one by one as they appeared; the rest remained inside, and were all burned to death. Of the whole troop, as I afterwards learned, not one escaped.

Heart-sick at this frightful butchery, I made my way over dead and wounded, burning fragments of carriages, and blackened stinking heaps of half-burned straw, through a short street that led to the Place Carrouzel, in which stands the Château of the Tuileries.

The chief portion of the combatants who had been engaged in the destruction of the Palais Royal and the Château d'Eau had again formed into column. Here I naturally expected a repetition of the scene I had just quitted. I threw myself into their ranks. I now had a musket and bayonet, besides a naked sword thrust through my belt, which I had found by the side of an officer of the Garde Municipale, in the Place du Palais Royal. A ferocious-looking ruffian was mounted on a dragoon's horse, which he fastened to one of the royal carriages, and drew it blazing, body and wheels, in front of our column.

Onwards we marched; still no sign of resistance. With drums beating in front, we passed through the triumphal arch that ornamented the chief entrance of the Tuileries. There was still some firing going on, but nothing to vince at. Onward we still marched, crossing the courtyard in front of the château, and entering by the principal gate.

Here was a scene which, though difficult to describe, will never be obliterated from my memory. It was a most splendid palace, glittering in crimson and gold; beautiful mirrors and paintings adorned the walls, and magnificent chandeliers hung from the richly-sculptured and gilded roofs. Marble statues and busts of celebrated generals stood in one magnificent saloon. Rich crimson hangings, fringed deeply with gold, were festooned from the lofty windows, which reached from the roof to the floor, opening to a magnificent terrace overlooking the garden. I ran from room to room, admiring all that in the lapse of centuries art could produce or unbounded wealth purchase.

I found myself at one time in the royal chapel, as yet uninvaded by the lawless rabble that were quickly spreading themselves all over the château. A feeling of reverential awe came over me as I walked up towards the high altar, where stood a large crucifix, seemingly of solid gold. Large wax candles, in massive candlesticks, stood by the altar. This scene of religious solitude contrasted strangely with the work of death and destruction I had so recently quitted, and the noise and turmoil resounding through the building.

After leaving the chapel, I hurried through many splendid saloons and spacious halls, until I entered the throne room. Here the work of destruction had commenced. The throne was torn from under its canopy, and borne away in frantic triumph by the mob. I tore a piece of the gold lace from the gorgeous crimson hanging, to preserve as a memento of the struggle.

And then began the plunder. Beautiful gilt panels were dashed in; desks, boxes, and bureaux were broken open, and their contents scattered over the floor; and soon the palace was one scene of rapine and destruction. Myself and a few others got into what I took to be the housekeeper's room. A fire was still burning on the

hearth, a white cloth spread on the table, and every preparation for the morning repast. I took a loaf as my share of the eatables, for which a fellow offered me a bottle of brandy. I divided the loaf with him, and drank rather too freely of the brandy. Stimulated by the drink, I began to plunder with the rest, filling and emptying my pockets a dozen times, as I found things of more value.

Among other things, I found a large packet of various commissions, ready signed and sealed with the royal arms. How many months, and perhaps even years, had some waited for those very commissions which I now tossed into the courtyard as useless lumber! Hanging in a wardrobe I found a large and handsome cloak, and as I had no pocket in which to place my ill-gotten treasure, I enveloped myself in its capacious folds, and sitting down on a sofa covered with rich crimson velvet, with my gun on my arm, and my sword by my side, quite enjoyed the fine prospect of the garden below.

Remembering that in 1830 the Tuileries were retaken by the troops, I thought it most prudent to decamp while I yet possessed the liberty. Descending the grand staircase for that purpose, I came opposite a large mirror, and never shall I forget my own disgusting appearance—my face flushed with excitement and drink, begrimed with dirt and smoke, and my lips black with powder, while my eyes looked wild, bloodshot, and unearthly.

On leaving the Tuileries, I was suddenly seized from behind, and a man in a stentorian voice demanded where I had procured my cloak. Having no wish to dispute the possession, I unfastened the chain, and threw it at his feet, and then mingling with the mob, made my exit.

On revisiting the Palais Royal, I found the work of destruction still going on. Three large fires blazed in the courtyard, consuming silk and velvet hangings, gilded sofas, couches, arm-chairs, and massive pictures. Hundreds now staggered about in every stage of intoxication, while a plentiful supply to continue their Bacchanalian revels was momentarily obtained from the cellars. Passing through the court of the Palais Royal, I saw a large arcade, usually filled by the fashionable and gay, now converted into an hospital. Two long lines of those very beds that I had seen thrown out of the windows now supported the wounded, whose moans and cries sounded mournfully in the ear. Not knowing how the fight had gone on in other parts of Paris, I thought it prudent to part with my gun before passing through the Barrier Clichy; but hiding my sword under my blouse, I reached home in safety.

[The remainder of this paper next week.]

MRS JAMESON'S LEGENDARY ART.

THE present age is accused, not without reason, of being too utilitarian. The people generally, it is alleged, have been intellectually sharpened and instructed in materialities, while but little attention has been paid to the imaginative feelings: existence has been robbed of its poetry. Efforts, however, we are glad to say, are now making to redeem the passing generation from reproaches of this nature. Matters of taste and refined art are now more attended to than they were a dozen years since; and in nothing is this more visible than the improved style of church architecture and decoration. The day is clearly gone when purity of religion was supposed to be uncongenial with any building better than a barn; painted windows are no longer heretical; and the gospel, it is now believed, can be preached with equal zeal and effect from a decently-draped pulpit as from the top of a tub.

In all this, and much more, we see the reaction which is the natural consequence of carrying out extreme views adverse to those imaginative feelings that may be dor-

mant in the human heart, but which no mere persuasion of judgment or prejudice can utterly extinguish. While thus in the dawn of a revival in the *spiritual* in art, and when society is looking back, as with a sigh, to the long and needless abasement of the beautiful, an author has stepped forward to enlighten us respecting many of those things which helped, in the olden time, to invest religion with poetry, and which, though possibly in themselves worthless, tended in some degree to impart a charm to the realities of existence. The work of Mrs Jameson, to which we refer,* is professedly connected with the arts of the sculptor and painter; but it likewise, from necessity, embraces much of the legendary lore on which artists founded their creations, and in this respect it may be said to be a useful handmaid of history. At all events, the book will not be perused without pleasure by those whose fancy is inclined to soar towards the confines of the spiritual world. It treats of the origin of devotional legends, of emblems and attributes of general application; angels, archangels, and hierarchies; apostles, fathers, and saints—the whole illustrative of art, and particularly of church decoration. Let us exemplify some of these interesting subjects.

Any one on entering one of the fine old cathedrals of England, will not be less struck with the general grandeur of effect, than curious as to the meaning of a variety of emblematic objects. In one or more of the gorgeously-painted windows he will see figures of the apostles: one depicted as holding a key; another with a sword in his hand; a third holding a book; and so on. Now, whence the origin of these fancies? From what source has the artist learned to drape the figures, and give each his suitable appointments? Again he sees that certain figures representing saints are invested with a halo of glory round the head. How did this idea originate? Again he observes that the representations of those beatific beings, angels, are furnished with large and feathery wings, while, as in the case of the demon which the archangel Michael is seen trampling under foot, the wings are those of a bat. On these, and other curiosities of archæology, the work before us offers explanations which cannot but suggest many interesting views of mental progress. Perhaps the most pleasing part of the production is the author's disquisition on angels. 'There is something,' says she, 'so very attractive and poetical, as well as soothing to our helpless finite nature, in all the superstitions connected with the popular notion of angels, that we cannot wonder at their prevalence in the early ages of the world.' To quote from Spenser:—

'How oft do they their silver bowers leave,
And come to succour us that succour want?
How oft do they with golden pinions cleave
The flitting skies, like flying pursuivant,
Against foul fiends, to aid us militant?
They for us fight, they watch and duly ward,
And then bright squadrons round about us plant,
And all for love, and nothing for reward!
Oh why should heavenly God to men have such regard!'

After referring to the principal notices of angels, and their attributes, in Scripture, the author refers to the belief in angels which anciently prevailed in the East, and the treatment of the subject by different schools of painters. As messengers and as choristers, angels have been depicted in the most lovely forms; but little, it is observed, has been done to illustrate their functions as guardians. On this neglect Mrs Jameson has some happy observations. 'They are the deputed guardians of the just and innocent. St Raphael is the prince of the guardian angels. The Jews held that the angels deputed to Lot were his guardian angels. The fathers of the Christian church taught that every human being, from the hour of his birth to that of his death, is accompanied by an angel, appointed to watch over him. The Mohammedans give to each of us a good and an evil

angel; but the early Christians supposed us to be attended each by a good angel only, who undertakes that office, not merely from duty to God, and out of obedience and great humility, but as inspired by exceeding charity and love towards his human charge. It would require the tongues of angels themselves to recite all that we owe to these benign and vigilant guardians. They watch by the cradle of the new-born babe, and spread their celestial wings round the tottering steps of infancy. If the path of life be difficult and thorny, and evil spirits work us shame and wo, they sustain us; they bear the voice of our complaining, of our supplication, of our repentance, up to the foot of God's throne, and bring us back in return a pitying benediction, to strengthen and to cheer. When passion and temptation strive for the mastery, they encourage us to resist; when we conquer, they crown us; when we falter and fail, they compassionate and grieve over us; when we are obstinate in polluting our own souls, and perverted not only in act, but in will, they leave us; and wo to them that are so left! But the good angel does not quit his charge until his protection is despised, rejected, and utterly repudiated. Wonderful the fervour of their love—wonderful their meekness and patience, who endure from day to day the spectacle of the unveiled human heart with all its miserable weaknesses and vanities, its inordinate desires and selfish purposes! Constant to us in death, they contend against the powers of darkness for the emancipated spirit. . . . When at length the repentant soul is sufficiently purified, the guardian angel bears it to the bosom of the Saviour.'

This may be wild, according to the world's notion, but we confess we are sufficiently poetical to embrace the belief in almost its literal sense. It gives us comfort to know that a messenger of God—a spirit of Divine grace—is watchful over our temporal concerns. Better at least for mankind that they should possess so confiding a faith, than that they trampled the spiritual altogether under foot.

With respect to legendary art as applied to representations of the saints and fathers of the church, it is instructive to observe how circumstances and appearances have led to myths, which ultimately obtained universal credence. The human mind longing after the infinite and marvellous, ignorant of the principles which produce the ordinary phenomena of nature, has been prone to myths; and indeed all knowledge may be said to pass through the mythic stage. A myth is a story of the marvellous and preternatural, such as the history of the heathen gods; but it is frequently associated with local appearances, which are supposed to be accounted for by its details. Every village has its myth. If there be a huge mound of earth, which nobody knows the origin of, it is said to be the grave of a giant, who lived in these parts long ago. If there be two round holes in the face of a rock at the distance of perhaps a foot from each other, they are Samson's span. If there be a row of large boulder stones on a moor, these were laid down by a celebrated wizard. Such are familiar examples of the *myth*. The pictures of the fathers are half mythic. St Jerome was reputed to be as bold as a lion; this talk of his lion-like character was expanded into a story, in which a lion performs a part; and the saint is accordingly always painted in company with a lion. Here is the myth:—'We read in the legendary history of St Jerome,' proceeds our authoress, 'that one evening, as he sat within the gates of his monastery at Bethlehem, a lion entered, limping, as in pain; and all the brethren, when they saw the lion, fled in terror. But Jerome arose, and went forward to meet him, as though he had been a guest; and the lion lifted up his paw, and St Jerome, on examining it, found that it was wounded by a thorn, which he extracted; and he tended the lion till he was healed. The grateful beast remained with his benefactor, and Jerome confided to him the task of guarding an ass which was employed in bringing firewood from the forest. On one occasion, the lion having gone to sleep while the ass was at pasture, some

* Sacred and Legendary Art, by Mrs Jameson. 2 vols. Illustrated with Engravings. Longman, London. 1848.

merchants passing by carried away the latter, and the lion, after searching for him in vain, returned to the monastery with drooping head, as one ashamed. St Jerome, believing that he had devoured his companion, commanded that the daily task of the ass should be laid upon the lion, and that the fagots should be bound on his back; to which he magnanimously submitted, until the ass was recovered; which was in this wise: One day the lion, having finished his task, ran hither and thither, still seeking his companion; and he saw a caravan of merchants approaching, and a string of camels, which, according to the Arabian custom, were led by an ass; and when the lion recognised his friend, he drove the camels into the convent, and so terrified the merchants, that they confessed the theft, and received pardon from St Jerome.

The stories of patron saints overcoming huge serpents and fiery dragons are all myths, founded on the discovery of saurian remains of a large size. The skeleton of a marvellously large reptile is found somewhere, and forthwith an imaginary hero called St George is mounted on a charger, and kills the terrible creature with his spear. We are, however, half sorry for having to unveil these popular myths; and recommending Mrs Jameson's fascinating book to the perusal, and not too prosaic judgment of our readers, we conclude with a very pretty myth, founded on the reputed bodily strength of St Christopher:—

‘Christopher was of the land of Canaan, and the name by which he was there known was Offero. He was a man of colossal stature, and of a terrible aspect, and being proud of his vast bulk and strength, he was resolved that he would serve no other than the greatest and the most powerful monarch that existed. So he travelled far and wide to seek this greatest of kings; and at length he came to the court of a certain monarch who was said to exceed in power and riches all the kings of the earth, and he offered to serve him. And the king, seeing his great height and strength—for surely, since the giant of Gath, there had been none like to him—entertained him with joy.

‘Now it happened one day, as Christopher stood by the king in his court, there came a minstrel who sung before the king, and in his story there was frequent mention of the devil, and every time the king heard the name of the Evil Spirit he crossed himself. Christopher inquired the reason of this gesture, but the king did not answer. Then said Christopher, “If thou tellest me not, I leave thee!” So the king told him. “I make that sign to preserve me from the power of Satan, for I fear lest he overcome me and slay me.” Then said Christopher, “If thou fearest Satan, then thou art not the most powerful prince in the world: thou hast deceived me. I will go seek this Satan, and him will I serve; for he is mightier than thou art.” So he departed, and he travelled far and wide; and as he crossed a desert plain, he beheld a great crowd of armed men, and at their head marched a terrible and frightful being, with the air of a conqueror; and he stopped Christopher on his path, saying, “Man, where goest thou?” And Christopher answered, “I go to seek Satan, because he is the greatest prince in the world, and him would I serve.” Then the other replied, “I am he: seek no farther.” Then Christopher bowed down before him, and entered his service; and they travelled on together.

‘Now when they had journeyed a long long way, they came to a place where four roads met, and there was a cross by the wayside. When the Evil One saw the cross, he was seized with fear, and trembled violently; and he turned back, and made a great circuit to avoid it. When Christopher saw this he was astonished, and inquired, “Why hast thou done so?”—and the devil answered not. Then said Christopher, “If thou tellest me not, I leave thee.” So, being thus constrained, the fiend replied, “Upon that cross died Jesus Christ; and when I behold it, I must tremble and fly, for I fear him.” Then Christopher was more and more astonished; and he said, “How, then! this Jesus,

whom thou fearest, must be more potent than thou art! I will go seek him, and him will I serve!” So he left the devil, and travelled far and wide, seeking Christ; and having sought him for many days, he came to the cell of a holy hermit, and desired of him that he would show him Christ. Then the hermit began to instruct him diligently, and said, “This king whom thou seekest is indeed the Great King of heaven and earth; but if thou wouldst serve Him, He will impose many and hard duties on thee. Thou must fast often.” And Christopher said, “I will not fast; for surely if I were to fast, my strength would leave me.” “And thou must pray!” added the hermit. Said Christopher, “I know nothing of prayers, and I will not be bound to such a service.” Then said the hermit, “Knowest thou a certain river, stony, and wide, and deep, and often swelled by the rains, and wherein many people perish who attempt to pass over?” And he answered, “I know it.” Then said the hermit, “Since thou wilt neither fast nor pray, go to that river, and use thy strength to aid and to save those who struggle with the stream, and those who are about to perish. It may be that this good work shall prove acceptable to Jesus Christ, whom thou desirest to serve, and that he may manifest himself to thee!” To which Christopher replied joyfully, “This I can do. It is a service that pleaseth me well!” So he went, as the hermit had directed, and he dwelt by the side of the river; and having rooted up a palm-tree from the forest—so strong he was and tall—he used it for a staff to support and guide his steps, and he aided those who were about to sink, and the weak he carried on his shoulders across the stream; and by day and by night he was always ready for his task, and failed not, and was never wearied of helping those who needed help. So the thing that he did pleased our Lord, who looked down upon him out of heaven, and said within himself, “Behold this strong man, who knoweth not yet the way to worship me, yet hath found the way to serve me!”

‘Now when Christopher had spent many days in this toil, it came to pass one night, as he rested himself in a hut he had built of boughs, he heard a voice which called to him from the shore: it was the plaintive voice of a child, and it seemed to say, “Christopher, come forth and carry me over!” And he rose forthwith and looked out, but saw nothing; then he lay down again; but the voice called to him in the same words a second and a third time; and the third time he sought round about with a lantern; and at length he beheld a little child sitting on the bank, who besought him, saying, “Christopher, carry me over this night.” And Christopher lifted the child on his strong shoulders, and took his staff and entered the stream. And the waters rose higher and higher, and the waves roared, and the winds blew; and the infant on his shoulders became heavier, and still heavier, till it seemed to him that he must sink under the excessive weight, and he began to fear; but nevertheless taking courage, and staying his tottering steps with his palm staff, he at length reached the opposite bank; and when he had laid the child down, safely and gently, he looked upon him with astonishment, and he said, “Who art thou, child, that hath placed me in such extreme peril? Had I carried the whole world on my shoulders, the burden had not been heavier!” And the child replied, “Wonder not, Christopher, for thou hast not only borne the world, but Him who made the world, upon thy shoulders. Me wouldst thou serve in this thy work of charity; and behold I have accepted thy service; and in testimony that I have accepted thy service and thee, plant thy staff in the ground, and it shall put forth leaves and fruit.” Christopher did so, and the dry staff flourished as a palm-tree in the season, and was covered with clusters of dates; but the miraculous child had vanished. Then Christopher fell on his face, and confessed and worshipped Christ.

In virtue of his services on the above occasion, Offero, the bearer, added the prefix Christ to his name,

forming the word Christopher. The legend has been finely illustrated by Albert Durer, who represents Christopher wading through a deep river, leaning on a staff, and carrying the infant Saviour on his shoulders. By a superadded myth, St Christopher is the helper of those who struggle with dangers and difficulties.

A CHAPTER ON ODD PEOPLE.

'Yes, sir,' said Dr Johnson once in reply to a remark of Boswell; 'every man who has brains is eccentric, because he sees and thinks for himself; and if he did not, minds would be all cut with compasses, and no rational man could endure society.' Doubtless the leviathan of literature, as both friends and enemies called him in his day, had learned, by means of his proverbial love of 'a good talk,' how much social life is enlivened by occasional obliquities of taste, and even of judgment.

'Defend me from pattern ladies and men of rule!' was the *petition* of a rather unruly poet, in which many who are not poets will be found to concur, for there seems a natural association between dulness and uniformity. Yet the widest deviations from received ideas, as regards external matters, are not always made by the ablest thinkers. All the world has heard, and probably by this time got tired, of the eccentricities of genius. They have been largely reported, and still more largely imitated, particularly those of the discreditable kind, since it was found out that great wit was allied to madness. Numbers who could never reach the former have adopted the latter as its nearest relation, forgetful that they were affecting only what had disgraced their betters, and too frequently that which would have disgraced any grade of mind.

But the age for such affectations, even of the harmless order, is past; eccentricity is now known to be one of the liabilities, not the consequence, of genius, and has been most prominently displayed in those who had no genius at all.

These are smoothing-down days, and peculiarities appear above the surface more rarely than they did in less polishing times; but uncelebrated oddities may still be encountered in every by-way and corner of life. The upland hamlet, the rural village, or the small country town, can generally boast a Miss or Mr Whimsy of its own, whose out-of-the-way sayings and doings will return among the pleasures of memory to some of its scattered denizens in far-off scenes and years. Even in great cities, where the perpetual though changeable currents of business and society are calculated to wear away the angularities of minds and manners, it is wonderful in what perfection they still exist.

The first Charles Mathews used to describe three meagre brothers, all men of business in New York, who always had their garments made double the fitting size, in order to save time and trouble in case their respective corporations should increase, an occurrence which appeared probable to them alone. The residents of another busy street in that same western city, about twenty years ago, may recollect an old man whose whim was still more remarkable. He was a bachelor with a decent income; and, strange to say, no miser, though he lived utterly alone, acted as his own attendant in every department of housekeeping, and never admitted a single feminine assistant, as his special ambition was to be what he called independent of women. There were those who said the old boy had been slighted or aggrieved by some of the sex in his younger days;

perhaps the story originated only in conjecture, but the advocates of woman's rights and mission would have been astonished at the legion of wrongs he could muster up when denouncing female tyranny, under which he affirmed the whole creation groaned. No misfortune, great or small, ever happened to any man within his knowledge which he could not trace, by a most elaborate process of reasoning, to some female hand. And one of his chief doctrines was, that no man could admit one of the fair (by courtesy) within the walls of his domicile and escape absolute slavery. To preserve his own liberty, therefore, this original philosopher superseded the ladies in actual service, from stitching shirts to making tea. He is said to have acquired extraordinary proficiency, particularly in the former art, and always boasted to his friends that he was one independent man.

Lingerers in the state of celibacy are popularly believed to be more addicted to eccentricity than the wedded of mankind; on which belief a minutely ingenious philosopher once suggested the inquiry, 'Whether being single was the cause of their singularity, or *vice versa*?' Certain it is that the special characteristics of the New York bachelor could exist in no other condition; yet it may be hoped that all the single are not singular, especially as some odd actors are occasionally found among the doubly-blessed.

I knew a married lady whose peculiar taste in dress formed the standing topic of conversation to the fairer portion of a country parish. She had been an heiress in a small way, and could therefore command some of the sinews of fashion; but she said no milliner should ever dictate to her, for she had an original fancy, and would not be put in uniform. This resolution she kept with the zeal of a patriot; never was the regimentalism of costume more defied than in the cut of her garments, while the boasted originality was displayed in an arrangement of colours, and an adaptation of materials, which set at naught all toilet regulations. Her favourite winter attire was a white flannel cloak lined with scarlet. She delighted in tartan boots; and when I last heard of her, she had just horrified the ladies of the neighbourhood by trimming her bonnet with broad-cloth.

Perhaps the most ordinary and unobtrusive form of eccentricity is favouritism with regard to certain articles. There was a man of rank some years ago in Paris, known to his acquaintances by the *soubriquet* of 'the shoe-gatherer,' from his habit of heaping up boots and shoes, new and old, till a large room in his residence was necessarily set apart for the purpose of containing them; and he was said rarely to have passed a shop of the kind without ordering home an additional supply.

A clergyman of my native village took a similar delight in wigs; and a hundred and fifty 'time defiers,' as a London wit designated those articles, were sold by auction on the good man's premises after his death. The rarest instance of this description I ever knew was that of a farmer whose enthusiasm rested on pots. He bought them, large and small, on every possible pretext, to the confusion of the kitchen-maid and the annoyance of his helpmate; till the latter, having a small taste of the Tartar in her composition, at length declared war against pot metal, and eventually won the day so far, that, on her husband's occasional visits to the nearest market town, she was wont to shout after him the following adjuration, 'Mind, bring no pots home with you!' Her injunction was generally obeyed, for the lady might not be provoked with impunity. But when

a supernumerary dram warmed the farmer's fancy, it would sometimes revert to the ancient channel, and he has been known to deposit a pot or two at a neighbouring cottage, as the dread of probable consequences occurred with the sight of his own chimney smoke.

Some persons are eccentric in their curiosity, and a troublesome kind of oddity it is at times to their neighbours, as they are apt to ask all manner of inconvenient questions. A family dispute, a lost situation, or a failure in business, is among their chosen subjects; and by way of securing authentic information, they make a point of applying to the parties most concerned. It was a genius of this order who, when Talleyrand was dismissed from office by the Emperor, sent him a long letter explicitly detailing all the reports in circulation against him, and concluding with a polite request to be informed which of them was true. A similar character on our own side of the British Channel one day mistaking Tyrone Power for a captain of his acquaintance who had just quitted the service under equivocal circumstances, seized the comedian by the button at Charing Cross, with, 'Oh, Captain Blake, I was sorry to hear it—'pon my honour I was—but were you actually cashiered for cowardice?'

'I have not the honour to be Captain Blake, sir,' said Power, still led along by the button; 'and when you meet that gentleman, I advise you not to press the question.'

'Why,' said the blunt of brain, 'couldn't he tell me best?'

'Ah yes, my dear fellow,' responded Power benevolently; 'but he might kick you!'

Probably the most eccentric expression of grief recorded is that of Madame du Defland, of Walpole notoriety, who, being informed in the midst of a large party that one of her intimate friends had died some hours before, ejaculated, '*Hélas!* I shall not be able to take any supper!'

Eccentric prejudices are comparatively common: one occasionally meets with individuals who regard the use of animal food as the cause of all the ills that flesh is heir to; and a gentleman, formerly residing in Kent, put his confidence entirely in turnips as their universal remedy. Constitutional antipathies or affinities, unaccountable as they are in themselves, would perhaps account for these notions, as well as for those eccentric preferences of sights, sounds, and odours, which are otherwise inexplicable. Persons have been known to dislike the smell of roses, and rather prefer that of garlic; others have relished the rasping of a file; and the Dutch doctor, who saw nothing in all Paris to admire but the shambles, has doubtless brethren in many lands.

There are, however, peculiarities of taste which have their origin in the higher ground of our nature, and belong to minds of a finer fabric. Charles Lamb confessed that he admired a squint, because a girl to whom he had been attached in early life squinted prodigiously; and a lady of my acquaintance once thought a club-foot interesting, from similar recollections. It is strange how seldom eccentricity takes an elevating or even an agreeable form: odd ways are rarely those of pleasantness, or peace either; though many of the world's notables have indulged in them, as stands recorded by better pens and ampler pages than mine. It is not always genius that makes one differ from his neighbours, but some heavy strength of character, considerable obstinacy, and at times right royal virtues, may be found among the oddfellows of creation.

One of the best-principled women I ever knew was possessed with a restless anxiety to learn not only the Christian names of every person she chanced to encounter, but those of all their relations in the ascending line. Her inquiries, which were vigorously pushed forward

in all companies, sometimes created most ludicrous annoyance to the parties interrogated, though I cannot recollect an instance of her getting beyond the great grandfather.

It has been observed that singular tastes and habits are less frequently found among the working-classes than in the superior ranks; the pressing necessities of life generally requiring the utmost exertions of the former in continuous labour, leave them neither time nor means for indulging in peculiarities. There is no scope for eccentricity in such circumstances; yet where the bent is strong, it will make room for itself. Some years ago a northern town of England, once famous in Border history, and now of some importance on one of our great railway lines, received an addition to its inhabitants, whose mode of conducting his pilgrimage through life, considering the path in which he journeyed, was something original. He was a man about thirty, tall, handsome, and of that sort of air generally known as genteel, on which point his singularity seemed to rest. The man avowed himself to be a native of London; his business was the sale and manufacture of muffins; and no one, so far as I heard, thought of inquiring after his name. He lived in a small cottage in the suburbs of the town, to which neither assistant, attendant, nor visitor was known to have been admitted. There he made his muffins, and thence he issued to supply his various customers as regularly as the English breakfast-hour came round. But no London exquisite, prepared for a lounge in Bond Street or the Park, could appear with more fashionably-cut coat, faultless hat, or more stainless linen; from the polish of his boots to the whiteness of his gloves he was a perfect Brummel, always excepting the basket over his arm, which, however, was ingeniously contrived to resemble that usually carried by anglers. Out of that array he was never seen on the street. How it could be obtained or kept in order was a daily renewed wonder. People said there was a very different dress worn at the cottage; and all the tailors of the town affirmed he made his own garments, as to the business of none had he given the smallest addition. His solitary leisure was spent in cleaning gloves, brushing up matters generally, and disciplining a couple of shirts; for that morning-sally was the joy of his life, and to be occasionally mistaken for a gentleman dandy, his only aim and reward. This devoutly-wished-for consummation he attained at times, and one instance of it served to amuse the townspeople, to whose knowledge it came, for many a day. The daughter of a respectable merchant who had just returned from a London boarding-school, with a large importation of airs, and a profound admiration for everything showy and useless, chanced to meet the incomparable recluse on the first of her morning walks. The young lady came home overflowing with what she called the romantic circumstance of a distinguished young nobleman actually coming to rusticate in such a place on pretext of angling in the celebrated salmon river. She knew he was Frederick Beauchamp, the brother of her particular friend Lady Theresa, daughter of the Earl of —, who had introduced him to her just before leaving school. He had looked very much at her: she would bow to him on the next occasion.

True to her resolution, she sallied forth on the following day after an hour's extra dressing, and encountered the object of her solicitude on his usual morning rounds. Miss took the opportunity of saluting him in the crowded street before two elderly acquaintances, and her nod was most gravely returned.

'He cannot recollect me, I am so much grown!' said she in a loud whisper.

'Do you know him?' inquired one of the ladies in company.

'Oh yes!' responded miss. 'I met him frequently in London.'

'Indeed!' replied the querist; 'he has been here for two years, and they call him the Muffin-Man.'

Her neighbours averred that, after that revelation,

the particular friend of Lady Theresa was never in a hurry to recognise distinguished-looking strangers; but with the eccentric muffin-man close my recollections of oddities.

CURIOSITIES OF TRADE.

Among the benefits which civilisation confers on mankind, the friends of utility have ever included the number and variety of employments it furnishes for their various talents and abilities. Since labour is evidently appointed to man, not only by the constitution of his nature, but by those necessities to which the great majority of our species are born, and since laws equally inevitable have produced an endless difference of individual capacity, the increase of occupations, always excepting those of a demoralising tendency, by enlarging the scope of energy, and multiplying the means of subsistence, is at once the natural resource and the best protection of society.

Doubtless the oldest professions were those of the hunter, the fisherman, and the husbandman. They are all that now exist among savage tribes; and it is remarkable that the last is invariably the least valued. The cultivation of the soil, natural and primitive as it seems, has always been considered beneath the savage man, and left to the inferior abilities of his wife. 'Would you have me lay aside the bow and spear, and hoe corn like a squaw?' said a Mohawk Indian, when, after complaining of the scarcity of game to a Moravian missionary, the latter advised him to employ himself in planting with maize a piece of rich prairie ground on which they stood. Probably the ancient British warriors, who wore the hide of the wild bison, and made their javelins of deers' horns, regarded what they knew of agriculture with no less contempt. Unluckily, a respect for useful industry does not yet remain to be acquired only by savages, nor has the proper distribution of labour advanced as far beyond the Mohawk's ideas as one may hope the progress of things will carry it; but the paths which human ingenuity has already struck out for itself in the course of that progression, are not more varied than remarkable in their windings through the different phases of civilisation.

The modes of daily labour generally denominated trades, present some varieties curiously adapted to the demands of times and countries in which they are found to flourish.

In the east of Asia, where black teeth are admired, from China to Kamtschatka, the profession of a tooth-stainer is quite as extensively followed, and in no less repute, than that of the European dentist, whose place it occupies. The duties annexed are, however, less comprehensive, being almost restricted to the blacking process, which, in a thousand cases, must be found more convenient than our contrary requisition. Dental diseases are by no means of such frequent occurrence in those regions as among the nations of Europe; and physicians have ascribed the fact to the simpler diet of the people, and the thoughtless, indolent current in which their lives flow on—scarcely more chequered by change or mental excitement than those of their sheep or cattle, which keep their teeth equally sound. The blacking business is practised by both sexes, and some of its chiefs enjoy considerable reputation and emolument from the permanence of their dye, and the jetty polish imparted by their art; the secrets of which are kept with Oriental tenacity, more especially from the barbarians, as Europeans are politely termed, the profession being determined against sharing their profits with them.

There is a description of trade, we believe, confined to China, and highly characteristic of its social condition. The Chinese name, which literally signifies gossip-monger, may sound rather new to British ears in connection with a paying vocation; yet such it is, and it is handsomely remunerative. A number of elderly ladies, generally widows, make it their business to collect gossip,

on dits, and stories of all sorts, with which they repair to the houses of the rich, announcing their arrival by beating a small drum, which they carry for that purpose, and offer their services to amuse the ladies of the family. When it is recollected that shopping, public assemblies, and even morning calls, are all but forbidden to the beauty and fashion of China by their country's notions of both propriety and feet, some idea may be formed of the welcome generally given to these reporting dames. They are paid according to the time employed, at the rate of about half-a-crown an hour, and are besides in the frequent receipt of presents—their occupation affording many opportunities of making themselves generally useful in matters of courtship, rivalry, and etiquette. On these accounts they generally retire from business in easy circumstances, but are said never to do so unless obliged by actual infirmity; and the Chinese remark that theirs is the only profession to which its practitioners are uniformly attached by inclination.

In most Mohammedan countries there exists a trade not less indicative of their peculiar customs. It is followed by a similar description of persons, but somewhat inferior in rank to the gossip-dispensers of China. Like them, they are generally old and solitary women, and called *dellalehs*, or female brokers. They go from house to house, collecting those specimens of needlework on which the inmates of the harem employ their abundant leisure. Purses, veils, embroidered shawls, and other appendages of Eastern fashion, are thus fabricated and intrusted to the *dellaleh*, who sells them to wealthier or less industrious ladies. From the very nature of her business, she knows where one article may be found and another is wanted, and so conducts a species of domestic commerce, from which considerable profits are said to be realised by the workers. Their industry is encouraged by the exclusive possession of the money thus acquired, it being inalienable, even in the case of slaves; and Lane, in his edition of the 'Arabian Nights,' supplies an instance of one of these girls, who privately gave her lover a sum of money from her own earnings, sufficient to purchase her in the public market. The *dellalehs* receive a small commission on their sales, and are usually trustworthy, as the contrary conduct would upset their business. They are also enabled to do a trifle in the gossiping line, and there are none more welcome visitors to an Eastern household.

The profession of a dancer is common over all Asia, and practised chiefly by women. In social position and general repute they resemble the ballet-girls of Europe; but wanting the accessories of the stage, which has scarcely a representative in Eastern lands, they never attain to the extravagant success of our Taglionis or Ellsers. Their business is to attend at banquets and merrymakings of all sorts, and dance for the amusement of the company, being remunerated according to time, and generally receiving some gratuity from the richer or more liberal guests, who admire and criticise their performance; but no person of respectability would be seen to dance in those countries, where a ball, therefore, is out of the question.

There was a trade transplanted in old times to Italy, it was said, by the early Crusaders, who brought it, with some other arts, from Asia, where remnants of the profession still exist, particularly among the Arabs: the practitioners were called in Italian *ricondetti*, or story-tellers, and their trade consisted entirely of relating long and marvellous narrations, many of which they were believed to invent for the purpose of keeping the time of the nobility from hanging heavy on their hands when it was not employed in either war or tournament. In times when none but priests could read, these men must have done some service to the community. Many of the wealthier barons retained story-tellers of their own in constant pay; and others of the profession went from castle to castle, and from town to town, in search of custom, charging so much per tale;

and they are said to have preserved and transmitted in this manner most of the old and popular romances of Europe.

The progress of the press, comparatively slow as it has been in Italy, has long since superseded this profession, as it is probable the advance of the school-master will that of the letter-writer, which is still a tolerably remunerative business in the southern division of the continent. About the middle of the last century it had attained its zenith in Paris, and many of the chief practitioners kept regular offices, with numerous clerks, appointed, according to their abilities, for the different orders of epistles, the composition of which they were expected to manage as well as the penmanship. Thus one was in the application line, which province included all letters of inquiry addressed to public offices, and those of people in search of situations. Next came the friendly division: it comprehended all correspondence with relatives or mere acquaintances. But the principal and most laborious was the love department, which required a double supply of hands. A facility in the imitation of different handwritings was an acknowledged recommendation to this employment, and its confidential secrecy was respected even by the police of the period.

It is worthy of remark that the professed letter-writer never appeared among the trades of England, in those very times of education so graphically described by a popular poetaster—

‘When not a man in twenty score
Knew how to make his mark.’

The nearest approach to it was the occupation of a small number then called clerks, but generally poor unbenefited clergymen, or ill-provided students, residing in large towns, who were employed to write news-letters, or summaries of the current intelligence, to the more curious of the nobility when abroad or in the country: their vocation flourished chiefly in the Elizabethan age, at the close of which it began to wane before that great adjunct of modern life—the newspaper; but some remains of it are observable in the time of the Protectorate, and it does not seem to have been totally extinct at the Revolution.

There are still older and equally superannuated trades that figure in the records of what may be called England's rustic times. One of them (and a contrast it is to the last-mentioned) was that of a pewterer. The manufacture of pewter-ware appears to have been almost peculiar to England, and was esteemed an affair of national pride and profit about the beginning of the fifteenth century, when the guild of pewterers was incorporated in the city of London, and a law, dictated by the narrow policy of the age, prohibited under severe penalties any who understood the art and mystery of pewter-making from going beyond the four seas of Britain, or taking the son of an alien as an apprentice, on any pretext whatever. It is strange to look on the old disused plates and flagons which may yet be seen in some out-of-the-way farm-house—the only remnants of once bright and ample rows—and think on how many subjects public opinion has changed, as well as on pewter, since parliament passed that statute.

A trade in many respects contemporary with the pewterers, was that known as a woman's tailor; for singular as it may sound, the dressmakers of our female ancestors belonged entirely to the rougher sex. Whether this arrangement originated in the fashions of former times, which prescribed the same substantial materials for the external garments of both lord and lady, dividing their rich velvets, heavy silks, and fine broadcloths equally between them, with comparatively small difference of form; or whether it was owing to a practical paradox in their social economy, similar to that which occupies tall fellows with gauze and gumflowers in our modern shops—is now too distant for our discovery; but the profession continued to stitch and prosper till the beginning of Charles I.'s reign, when his queen, Henrietta

Maria, introduced at once that article of dress called the mantua, and its feminine fabricator, as a French improvement, to the ladies of her court; on which account the term mantuamaker was applied to needlewomen in general, almost to our own times. Shakspeare, in one of his dramas, introduces a disciple of the art referred to, in terms which indicate how low a place the kirtle-making man held in popular respect.

A branch of female industry which rose with his decline, has long since merged in the complicated duties of the laundress; but in the latter days of Elizabeth, few professions in England were more remunerative than that of a starcher. Stiffness was then the order of dress; and a divine of the period complains that the court starchers were more esteemed and better paid than the court chaplains. How far that preposterous preference may have weighed with the pulpit, it is not for us to decide; but sundry sermons were preached against starch: yet in the reign of Charles II. it appears that the apprentice fees required by a professor of the art were L.10 for boiling, and L.5 for putting on—a smart sum, as money was then estimated.

An observant statist has remarked that the only trade which has become extinct in Scotland for many centuries, is that of the professional beggar or blue-gown, a humble but significant feature of his times. One of the most primitive and longest-perpetuated trades is that of the gem-seeker of Bohemia, the rocks of that mountainous and yet wild country being known to contain a great variety of stones valued by the jeweller. The opal, jasper, and amethyst, are found imbedded in their crevices; and in the search for these the gem-seeker spends his days. He goes into the wilds a solitary man, like the chamois-hunter of the Alps; but carrying, in lieu of his rifle and ammunition, a chisel, a hammer, and a small wooden mallet stuck in his belt, from which hangs a pouch to contain the gems. He is generally of the peasant class, and not particularly regular in his habits, a too frequent accompaniment of uncertain earnings, which those of the gem-seeker must be; but as a class, their patience and skill in tracing out the objects of their search are said to be almost incredible; and there are current a thousand tales of fortunate men who bought lands and built castles with the proceeds of a single day's discovery. However, these stories generally date from distant times.

Popular superstition or credulity has given ground for several singular and sometimes profitable trades; such as the rain-makers of Africa, the serpent-charmers of India, and the fortune-tellers, dream-readers, and finders of stolen goods, so trusted in Europe's darker days, and still known through some lowly representatives in its backward corners. It is, however, consolatory to think that so few really useful trades have been lost or superseded in the course of ages, compared with the many avenues of exertion opened by an increased demand for the conveniences and refinements of life. Strange it is, too, in spite of the familiarity consequent on everyday recurrence, to reflect how many of the employments of mankind are full of risk and danger: the diver, the miner, and the fireman, have dreadful trades, as well as the ‘one that gathers sapphire.’ They are indeed, to quote from a German philosopher, ‘ennobled by utility;’ and as the butcher remarked of his own ungentle craft, ‘somebody must do it.’ Doubtless the reconciling power of habit may be largely reckoned on; and in this portion of the curiosities of trade, an honest Savoyard's experience, though belonging to the last century, seems to deserve a place for its singularity. He had been obliged to leave his native valleys in search of work, and could find none but that of making wooden shoes for the French peasants among whom he settled; in process of time the sabots such as the Savoyard made went out of fashion, and then he betook himself to the sweeping of chimneys. Some years after a mine was opened in the district, and the Savoyard became a collier, but still

varying matters with his second profession: when he went down a shaft, the worthy man was wont to thank his stars that it was not up a flue; and when on the sooty ascension, his thanksgivings were equally fervent that he was not going down to the mine; but he always assured his friends that neither of them was so bad as the making of sabots.

CENTRAL AUSTRALIA.

It is strange that the immense island, or small continent, of Australia, although bordered with British colonies, should be still in great part a land of darkness and mystery, similar to those expanses on which, when figured in their maps, our ancestors used to write the words *terra incognita*. But so it is. Repeated attempts have been made to explore its interior; but to the present moment we cannot tell whether this portion of the British dominions contains such inland seas as we find in America, or is laid out in almost interminable deserts of sand, earth, or stones. Captain Sturt, one of the most persevering and enterprising of the Australian pioneers of science, has just published a narrative of his explorations; and although he is far from solving the enigma, we think it may be well to relate briefly what he has really accomplished, and thus to put our readers in possession of the question as it at present stands.*

There is little doubt that South Australia is the point from which the expedition must set out which is destined to bring the whole region within the pale of geographical science; that is to say, it must draw a line, south and north, from the eastern angle of the great Australian bight to the Gulf of Carpentaria, crossing the tropic of Capricorn. The farthest point gained by Captain Sturt was 24° 40' south latitude, or a little more than half-way between the head of the bight and that of the gulf. His account of this adventurous journey wants compactness. If it were merely rough, we should like it all the better; but its redundancy in unimportant details brings forward unpleasantly the want of literary style and artistic keeping, and will perhaps render the captain's audience fewer than his labours deserve.

South Australia, the starting-point, is, as our readers know, a rather flourishing settlement, placed about the middle of the southern side of the island or continent, between Port Philip on the east, and Swan River colony on the west, and extending northwards into the interior to the 26th parallel of latitude. On the sea-board there is plenty of good anchorage, and several secure and capacious harbours; and Port Adelaide forms an excellent shipping entrepôt for the capital, which stands at a distance of six miles from the sea. The city contains a population of about 10,000 souls, with churches and schools on a respectable scale, and shops overflowing with almost every article of European produce, generally at a very trifling advance on home prices.

A considerable part of the province is well wooded for some distance inland; but the trees decrease in number as you proceed towards the north, till at length the country is laid out in open downs. The proportion of unavailable land is, in Captain Sturt's opinion, greater than that of good land; indeed he thinks the quantity of the latter very limited in proportion to the extent of the territory. Its quality, however, has been hitherto under rather than over-estimated; and the province is, upon the whole, well fitted for a rural peasantry, and calculated to support likewise by its agricultural products large masses of a mining and manufacturing population. The average crop of wheat is upwards of twenty-five bushels to the acre on the better soils; but in some localities it exceeds forty; and it has been known to reach fifty-two.

The whole area of the province contains about 300,000 square miles, or upwards of 190,000,000 acres; but the actual location does not exceed 7,000,000 acres, and even in this there is included a considerable portion of unavailable land. Of the available land, 470,000 acres have been purchased; but the extent of country occupied by sheep and cattle stations is not known. Agricultural operations have increased so rapidly within the last few years, that the produce far exceeds the wants of the settlers; and the flour which in 1839 was L.120 a ton, is now from L.12 to L.13. Live-stock has increased in a similar ratio; the number of sheep being now about 1,000,000, with an annual increase of 200,000; whereas in 1844 the number assessed was only 355,700. Even before this prosperous course began—that is, in 1843—the discovery of rich mines gave a powerful impulse to the rise of the colony; but the mineral thus opened to the industry of the inhabitants is looked upon by our author rather as an auxiliary than as the main cause of the turn of their fortunes. The copper ores of Australia are more valuable in the Swansea market than those of any other region; but the necessity of sending them thither for smelting—owing to the want of coal, and the scarcity of wood near the mines—is the great drawback upon the rising fortune of the colony. The Burra Burra mine, however, in 1847 paid three dividends to its proprietors, amounting to 200 per cent. on the subscribed capital.

Proceeding into the interior from the coast towards the north, the features of the country become exaggerated; and in the midst of vast deserts, we arrive at extensive oases of woods and pastures. The author's geological theory is, that the continent of Australia was at one time an archipelago, but that the land covered by the sea was suddenly raised to its present level by igneous agency. The country sinks from the north and north-east towards the south and south-west, and in this direction there came, during the convulsion referred to, a rush of waters, which, being divided by interposing obstacles, sought the sea on one side by the channel of the river Darling, and on the other by the great Australian bight. This hypothesis accounts for various appearances our traveller observed on the surface of the country. He supposes that the two parts of the country, in the direction of the torrent, were originally separated by water; and that there will still be found the traces of this separation in one or more inland seas. Captain Sturt's expedition, however, was limited in its object. He was absolutely forbidden to conduct his party through the tropical regions to the Gulf of Carpentaria, but was directed to ascertain the existence or non-existence of a chain of hills supposed to trend from the north-east to the south-west, and form a great natural division of the continent. This chain may be considered, from the result of his inquiries, to have no existence; but he did not quite reach the tropic, and was 150 miles to the east of the centre of the continent.

In his dreary journey he passed through successive deserts of sand, earth, and stones. The first was perhaps the most tormenting, the travellers being lost in small basins or hollows, from which they were unable to see to any distance. There was no grass for their horse, no water. 'We were then in one of the most gloomy regions that man ever traversed. The stillness of death reigned around us; no living creature was to be heard. Nothing visible inhabited that dreary desert but the ant; even the fly shunned it; and yet its yielding surface was marked all over with the tracks of native dogs.' Day after day they continued traversing this wretched country, unable to see a mile in any direction. They at length reached a small round hill, which they eagerly ascended; but 'there was no apparent change; for the brush in the distance was darker than that nearer to us, as if plains succeeded the sandy desert we had passed over. The whole landscape, however, was one of the most gloomy character, and I found myself obliged to turn from it in disappointment.

* Narrative of an Expedition into Central Australia, &c. By Captain Charles Sturt, F.L.S., F.R.G.S., &c. 2 vols. London: Boone, 1849.

As far as I could judge, we passed about a mile beyond the 28th parallel.'

We shall now, by way of a change, introduce the reader to the Stony Desert. 'On travelling over the plain, we found it undulating, with shining hollows, in which it was evident water sometimes collects. The stones, with which the ground was so thickly covered as to exclude vegetation, were of different lengths, from one inch to six. They had been rounded by attrition, were coated with oxide of iron, and evenly distributed. In going over this dreary waste, the horses left no track, and that of the cart was only visible here and there. From the spot on which we stopped no object of any kind broke the line of the horizon: we were as lonely as a ship at sea, and as a navigator seeking for land, only that we had the disadvantage of an unsteady compass, without any fixed point on which to steer. The fragments covering this singular feature were all of the same kind of rock, indurated or compact quartz, and appeared to me to have had originally the form of parallelograms, resembling both in their size and shape the shivered fragments lying at the base of the northern ranges, to which I have already had occasion to call attention.'

Another extraordinary feature followed—the Earthy Desert; 'resembling in appearance a boundless piece of ploughed land, on which floods had settled and subsided. The earth seemed to have once been mud, and then dried. Over this field of earth we continued to advance almost all day, without knowing whether we were getting still farther into it or working our way out. About an hour before sunset, this point was settled beyond doubt by the sudden appearance of some hills over the line of the horizon, raised above their true position by refraction.' These hills, however, soon disappeared; and when reached the next day, they proved to be merely lofty ridges of sand. 'It is a remarkable fact that here, on the northern side of the desert, and after an open interval of more than fifty miles, the same sand ridges should occur, running in parallel lines at the same angle as before, into the very heart of the interior, as if they absolutely were never to terminate. Here, on both sides of us, to the eastward and to the westward, they followed each other like the waves of the sea in endless succession, suddenly terminating, as I have already observed, on the vast plain into which they ran. What, I will ask, was I to conclude from these facts?—that the winds had formed these remarkable accumulations of sand, as straight as an arrow lying on the ground, without a break in them for more than ninety miles at a stretch, and which we had already followed up for hundreds of miles—that is to say, across six degrees of latitude? No; winds may indeed have assisted in shaping their outlines, but I cannot think that these constituted the originating cause of their formation. They exhibit a regularity that water alone could have given; and to water, I believe, they plainly owe their first existence. It struck me then, and calmer reflection confirms the impression, that the whole of the low interior I had traversed was formerly a sea-bed, since raised from its submarine position by natural though hidden causes; that when this process of elevation so changed the state of things as to make a continuous continent of that which had been an archipelago of islands, a current would have passed across the central parts of it, the direction of which must have been parallel to the sandy ridges, and consequently from east to west, or nearly so—that also being the present dip of the interior, as I shall elsewhere prove. I further think that the line of the Stony Desert being the lowest part of the interior, the current must there have swept along it with greater force, and have either made the breach in the sandy ridges now occupied by it, or have prevented their formation at the time when, under more favourable circumstances, they were thrown up on either side of it.'

During some portions of the journey the heat was terrific. 'Under its effects every screw in our boxes

had been drawn, and the horn handles of our instruments, as well as our combs, were split into fine laminae. The lead dropped out of our pencils; our signal rockets were entirely spoiled; our hair, as well as the wool on the sheep, ceased to grow; and our nails had become as brittle as glass. The flour lost more than 8 per cent. of its original weight, and the other provisions in a still greater proportion.' One day the wanderers of the desert saw a number of small black specks in the upper air, which increased every moment in size, till presently they found themselves surrounded by hundreds of the common kite, stooping down to within a few feet of them, and then turning away after a steady gaze. The birds had doubtless wondered in their turn what the small black specks were that moved, as if at random, upon the bosom of the desert, and had come down merely to satisfy their curiosity. They had, however, a formidable aspect; and as some of them, on approaching close, threw themselves back, as if to avoid contact, and opened their beak and spread out their talons, the travellers could not help fearing the result of a combat with so numerous a body if the visit should really prove to be hostile.

On another day their attention was attracted by a black and solitary object on a little rising ground in front of their camp. The dogs flew towards it, and were seen worrying some creature, notwithstanding a brave resistance. This was a human being, a native of the desert, half-dead with hunger and thirst. 'Whence this solitary stranger could have come from we could not divine. No other natives approached to look after him, nor did he show anxiety for any absent companion. His composure and apparent self-possession were very remarkable, for he neither exhibited astonishment nor curiosity at the novelties by which he was surrounded. His whole demeanour was that of a calm and courageous man, who, finding himself placed in unusual jeopardy, had determined not to be betrayed into the slightest display of fear or timidity.'

Generally speaking, the natives they met in the more remote regions took to flight on being observed, and exhibited in other respects the greatest awe of the Europeans. Sometimes, however, they were of a very different character, as may be seen in the following interesting family group. 'Their families generally were on the opposite side of the river, but one man had his *lubra* and two children on our side of it. My attention was drawn to him from his perseverance in cutting a bark canoe, at which he laboured for more than an hour without success. Mr Browne walked with me to the tree at which he was working, and I found that his only tool was a stone tomahawk, and that with such an implement he would hardly finish his work before dark. I therefore sent for an iron tomahawk, which I gave to him, and with which he soon had the bark cut and detached. He then prepared it for launching by puddling up its ends, and putting it into the water; placed his *lubra* and an infant child in it, and giving her a rude spear as a paddle, pushed her away from the bank. She was immediately followed by a little urchin, who was sitting on the bank, the canoe being too fragile to receive him. But he evidently doubted his ability to gain the opposite bank of the river; and it was most interesting to mark the anxiety of both parents as the little fellow struck across the foaming current. The mother kept close beside him in the canoe, and the father stood on the bank encouraging his little son. At length they all landed in safety, when the native came to return the tomahawk, which he understood to have been only lent to him. However, I was too much pleased with the scene I had witnessed to deprive him of it; nor did I ever see a man more delighted than he was when he found that the tomahawk, the value and superiority of which he had so lately proved, was indeed his own. He thanked me for it; he eyed it with infinite satisfaction; and then turning round, plunged into the stream and joined his family on the opposite bank.' Sometimes the native

camps were highly picturesque. Their denizens sat up to a late hour at night; the women employed in beating between two stones the seed for cakes, with a noise resembling that of the working of a loom factory, and the men moving about from hut to hut. 'The whole encampment, with the long line of fires, looked exceedingly pretty; and the dusky figures of the natives standing by them, or moving from one hut to the other, had the effect of a fine scene in a play. At eleven all was still, and you would not have known that you were in such close contiguity to so large an assemblage of people.'

Captain Sturt speaks very favourably of the Australian savages; but even from his account their civilisation would appear to be hardly possible. In the schools of the settlements the native boys and girls are taught to read, write, and cipher as well as European children of the same age; but here their capacity of receiving instruction ends. An appeal to any higher department of intellect is always vain. They desert the schools, and betake themselves to their ancestral wilds; and notwithstanding all the efforts of philanthropy, not the slightest improvement has been made in the social condition of the race. Captain Sturt thinks that if the children experimented upon were separated entirely from their parents and tribe, the result might be different; but it may be a question whether we are authorised to sever in this way the bonds of nature, even for the presumed good of the individuals themselves.

The results of the expedition, as we have said, go far towards proving that there is no mountain range in the interior of Australia, but that, on the contrary, its central regions are nearly on the sea level, and its northern and southern coasts as completely separated by deserts as if an ocean rolled between them. Captain Sturt still thinks there must be an inland sea; but he has no hope of any fertile country being discovered. 'Although I did not gain the direct centre of the continent,' says he modestly, in concluding some general remarks, 'there can be very little doubt as to the character of the country round it. The spirit of enterprise alone will now ever lead any man to gain it, but the gradual development of the character of the yet unexplored interior will alone put an end to doubts and theories on the subject. The desert of Australia is not more extensive than the deserts in other parts of the world. Its character constitutes its peculiarity, and that may lead to some satisfactory conclusion as to how it was formed, and by what agent the sandy ridges which traverse it were thrown up. I would repeat, that I am diffident of my own judgment, and that I should be indebted to any one better acquainted with the nature of these things than I am to point out wherein I am in error.'²

Before concluding, it will be proper to advert shortly to the other measures that have been taken, or are in progress, for exploring the continent. To say nothing of Dr Leichhardt's successful expedition from Moreton Bay to Port Essington, Sir Thomas Mitchell, the surveyor-general, discovered a great river in the interior, trending towards the Gulf of Carpentaria, and having its embouchure, as he imagined, in that supposed outlet for the drainage of the region. He pursued the river, which he named the Victoria, for ten days, through a splendid country, covered with luxuriant pasturage. 'That the river,' says he, 'is the most important of Australia, increasing as it does by successive tributaries, and not a mere product of distant ranges, admits of no dispute; and the downs and plains of Central Australia, through which it flows, seem sufficient to supply the whole world with animal food.' To ascertain the further course of this remarkable stream, Mr Kennedy, a young officer who had accompanied Sir Thomas Mitchell,

was deputed; but his account was by no means favourable to the sanguine views of the surveyor-general. The Victoria, instead of continuing to trend towards the north, turned to the south-west, and was then divided into several branches, 'spreading over a depressed and barren waste, void of trees or vegetation of any kind, its level surface being only broken by small doones of red sand, like islands upon the dry bed of an inland sea, which I am convinced at no distant period did exist there.' This river appears to be identical with Cooper's Creek, discovered by Captain Sturt, and, in his opinion, is either lost in the Stony Desert, or terminates through it in the conjectured inland sea.

Dr Leichhardt in the meantime set out about a year ago on a journey from Moreton Bay to Swan River, in which he will traverse the continent in a transverse direction from that of Captain Sturt, from east to west, having a distance before him of more than 5000 miles in a direct line. He had already made an attempt in the same course, but was obliged to return, his party being disabled by the ague, and the loss of all their animals. We cannot expect to have news of this adventure for a year to come; but after all, the most favourable result we can expect from it is the gratification of scientific curiosity. As a grazing and agricultural region, Australia has already been sufficiently discussed; and the unoccupied tracts of New South Wales alone would of themselves afford an almost boundless field for the industry of Europe. 'The only thing to be regretted,' says Captain Sturt, 'is, that the want of an industrious population keeps it in a state of nature, and that the thousands who are here (in England) obtaining but a precarious subsistence, should not evince a more earnest desire to go to a country where most assuredly their condition would be changed for the better.'

ELECTRO-METALLURGY.

THE striking process of which we are now to give some account, affords a beautiful example of the adaptation of purely scientific knowledge to the details of productive industry. Not many years have elapsed since electricity was looked upon as a mysterious agency, more to be prosecuted as a subject of speculative science, than as affording means for obtaining practical results applicable to the production of articles of taste and utility in our arts and manufactures. Now the case is different; and for such ends the agency of electro-galvanism, one of the branches of the parent science, is in daily requisition.

Professor Daniell having constructed what he called his 'Constant Galvanic Battery,' found that, by the peculiar action of the galvanic current, the copper contained in the solution of sulphate of copper, used as one of the exciting liquids, was deposited in a thin film on the sides of the vessel containing it, and that a fac-simile of any projection or indentation thereon was at the same time faithfully given in the metallic deposit.

Mr Spencer of Liverpool, Mr Jordan of London, and Professor Jacobi of Petersburg, aware of the above fact, almost simultaneously, and without any communication with each other, conceived the idea that the circumstance might be taken advantage of in producing fac-similes of medals, engravings, &c.; and with this view instituted experiments, which proved the interesting fact, that impressions might be taken in copper of any article prepared for its reception, by suspending it in a solution of sulphate of copper, and causing a galvanic current to pass through it. By a natural train of thought, certain persons were led to try whether the more valuable metals, as silver or gold, could be deposited by galvanic agency. It was left for the Messrs Elkington of Birmingham, by a very extensive course of experiments, to prove the perfect possibility of the plan, which formed the subject of the patents granted to them for improvements in electro-typing or electro-metallurgy. Before detailing a few of the curiosities of this wonderful process, we will briefly explain the mode of operating. To obtain fac-similes of engravings in copper, the following apparatus is required:—A box divided into two portions by a porous partition is provided; and in one of these cells the copper-plate is suspended by a wire attached to a metallic rod stretching across the mouth of the box, and in the other a zinc plate, of smaller size than the copper. The

* The sand ridges described by Captain Sturt appear to be of the same character with the *osars* of Sweden, the *eskers* of Ireland, and the *kames* of Scotland, all of which are now regarded as having been formed by some peculiar action of the sea, while the land was as yet covered by that element.—ED.

galvanic communication is effected by an intervening rod, having screws attached to it for the convenience of manipulating. Into the cell containing the copper, water and crystals of sulphate of copper are put; and into the zinc cell, water and pulverised sal-ammoniac. To prepare the plate for the deposition, the parts not required to be coated with the metallic film must be protected from the action of the fluid; and this is done by covering them with sealing-wax dissolved in spirits of wine. The galvanic action goes on, gradually depositing on the exposed parts of the plate a film of copper; and when this is of sufficient thickness, the plate is withdrawn, and the film removed. But the fac-simile, although correct, is in relief, and to be of use, a copy in intaglio must be produced; and this is at once obtained by submitting the relief to the same process as the original plate, of which the new deposition of copper is an exact fac-simile. Mr Smee, however, has made public a very beautiful and still more striking process for obtaining copper-plate engravings without the use of an engraved copy at all. He proposed to draw the required design on a smooth copper-plate, with a pigment or varnish insoluble in water, and then to expose the plate to the galvanic action; when, the film of copper being deposited on all the parts not varnished, a copy in intaglio would be produced. Casts of seals, medals, &c. can be obtained in copper by this method. To prepare the articles for deposition, the mode of rubbing or covering their external surfaces with black-lead, discovered by Mr Murray, must be adopted; for the copper having what may be called an affinity for the black-lead, easily deposits itself on any surface covered with it. Articles so prepared can be copied in great numbers at a small expense.

For obtaining duplicates for printing from wood-engravings, the electrolyte is employed. The engraving, after being black-leaded, is bound round the edges with a strip of tinfoil, and suspended, and kept perpendicularly in the fluid. Copies of plaster casts are easily taken, as also of wax models, by means of the same process. But perhaps the most beautiful exemplification of the process is seen in the ease by which natural organised substances are covered with a thin film of copper. The leaf or branch to be operated upon is covered, by means of a soft brush, with the black-lead, and suspended in the fluid. Butterflies and moths are also easily covered; shrub-flowers are extremely beautiful, with thin delicate fibres fully and clearly developed on their metallic covering. Mr Smee thus writes of them:—'The beauty of electro-coppered leaves, branches, and similar objects, is surprising. I have a case of these specimens placed on a black ground, which no one would take to be productions of art. In the same room with them are a couple of these cases in which Ward has taught us to grow in this smoky metropolis some of the most interesting botanical specimens. In these cases are contained varieties of fairy-formed *adiantums*, verdant *lycopodiums*, brilliant *orchideæ*, rigid *cacti*, and other plants, all growing in their natural luxuriance. The electro-coppered leaves, however, are beautiful when placed by the side of the productions of this miniature paradise; and when I state that the numerous hairs covering the leaves of a *melostoma*, and even the delicate hairs of the *salvia*, are all perfectly covered, the botanist must at once admit that these specimens have rather the minuteness of nature than the imperfections of art.' In plating articles with the precious metals, the weight of metal deposited is found by weighing the article previous to insertion in the liquid, and again after receiving the deposition, when the difference is the weight of metal. For silver, the article is suspended in a solution of the cyanide of potassium and silver; and for gold, the cyanide of potassium and gold. The articles now plated with silver are very numerous—forks, spoons, salvers, &c. The solution of silver is kept charged with sheets of pure silver suspended in the vessels; from which the metal is dissolved as fast as it is deposited, leaving finally a lace-like piece of silver of extremely delicate and beautiful fibres. In coating articles of value with a film of gold the same process is gone through, but of course on a much smaller scale. The solution is supplied with the precious metal by placing a small strip of pure gold round the vessel. Small articles, such as watch-chains, buttons, &c. that can be suspended on a wire, are inserted in the solution, and gilt in a remarkably short space of time. A writer in the 'Penny Magazine' states that he saw 'ten gross of coat buttons strung upon a wire, and all perfectly gilt, by an immersion of less than one minute.' Having now glanced at the methods of plating the external

surfaces of articles with gold and silver, we will briefly explain what we may term the chief triumph of the art—the production of solid articles in the precious metals.

We will suppose a vase to be required in gold: a delicate wax model, containing all the figures in relief to be on the surface, is first prepared; from this wax model a leaden mould is produced, and from this a brass model or pattern is cast; on which the engraver finishes the designed parts more fully, and from this finished pattern a mould in an elastic substance is obtained, composed in some instances of glue. This, by its elasticity, allows the mould to be separated easily from the parts of the pattern which are undercut; and it is used to provide a model in wax, suet, and phosphorus, on which a film of copper is laid by the galvanic agency. The wax forming originally a foundation for the copper, is again used as a foundation for the more precious metal. It is melted from the inside of the copper deposit, and the copper shell left has in its interior an exact fac-simile of the original design. The copper mould is next introduced to the solution of cyanide of potassium and gold, the exterior being protected by the resisting medium. The gold is gradually deposited equally over the raised and depressed portions of the mould; and the process is allowed to go on till sufficient thickness is obtained, when the whole is withdrawn, and the outside film of copper melted off by the action of an acid, leaving a solid and pure vase of gold. The gold and silver, whether of solid or superficial deposit, after coming from the solution, have a dull dead appearance; and to obviate this, the articles undergo the operation of burnishing. To prove that in solid deposit the particles are as closely united as if they had passed through the melting-pot, they give a clear sonorous ring when struck on an anvil with a hammer.

SONNET.

BY CALDER CAMPBELL.

WHEN'E'R I feel this rare excess of health
Thrill suddenly throughout my frame, as now,
Forgetting hoary hair and furrowed brow,
I turn a braggart of my fancied wealth
Of stalwart strength and life. I seek the glow
Of sunshine, singing; gather (not by stealth,
But with an honest boldness) fruits that grow
Out of my reach at other times; and offer
The sweets I taste to others—letting go
Sickness and its entailments from my mind;
And, like the miser near his rifled coffer,
Unconscious that it holds no more his pelf,
I glory in delusion—till I find
Some old-recurring pang recall me to myself!

NEWSPAPERS.

I am sure that every person will be willing, as I am, to acknowledge, in the most ample terms, the information, the instruction, and amusement derived from the public press.—*Lord Lyndhurst*. The newspaper is the chronicle of civilisation, the common reservoir into which every stream pours its living waters, and at which every man may come and drink; it is the newspaper which gives to liberty practical life, its perpetual vigilance, its unrelaxing activity. The newspaper is a daily and sleepless watchman, that reports to you every danger which menaces the institutions of your country, and its interests at home and abroad. The newspaper informs legislation of the public opinion, and it informs people of the acts of legislation; thus keeping up that constant sympathy, that good understanding between people and legislators, which conduces to the maintenance of order, and prevents the stern necessity for revolution.—*Sir E. L. Bulwer*.

INCORRECTNESS OF CONVERSATIONAL LANGUAGE.

The influence which common parlance exerts on the acquisition of correct notions on scientific subjects has often an unfortunate tendency. Thus, when we say in dull weather, 'The day is heavy'—'The air is thick and heavy,' it is not generally supposed that the air is really *lighter* than on a fine day; but the fall of the barometer indicates that this is the fact.—*Isaiah Deek*.

SCOTCH CAUTION.

It has become a settled point that the people of Scotland are remarkable for a cold and cautious temper. Has it never occurred to any of the multitudes who receive and repeat this doctrine, that it is strangely at issue with a vast proportion of the facts known regarding the Scottish people? We make no apology for briefly discussing the subject, because it is manifestly a curious circumstance that a people should generally act in contradiction of one of their most notable attributes.

A potent English monarch had, at the close of the thirteenth century, by craft and force completely established a right of dominion over this poor little northern country. A private gentleman rose in rebellion. The people for years supported him in a guerilla warfare, which scarcely was blessed with a hope of success. Wallace at length came to the end that might have been expected. He was put to death by the ungenerous usurper. Within two years, one of the claimants of the crown, who might have continued to be a great lord under Edward, is found taking up the same dangerous game. In the whole series of transactions which followed, down to the battle of Bannockburn, there is a show of almost every quality on the part of Bruce and the Scots *except* caution. That battle itself would have never happened, if Bruce had not been a romantic knight rather than a politic king, for it was obviously impolitic for a leader with thirty thousand troops to meet an enemy with a hundred thousand in the open field.

Throughout the almost incessant wars, external and internal, in which the Scotch were engaged for two hundred years after this period, there is no trace of a Fabian policy: all is headlong ardour. A pretty young French queen, wishing to make a diversion against the king of England, with whom her husband was at war, sends a ring to the king of Scotland, with a request that he would ride three miles into English ground for her sake. The Scottish monarch, though a married man above forty years of age, immediately invaded England under this call. In a few weeks, while resting with his army on a Northumbrian hill, he saw an English army deploying over a bridge to fight him. A politic man would have attacked it when half over, and beaten it. James was too gallant to take any such advantage. In the consequent battle, he lost his life, along with the flower of his nobility and people. One is astonished at the utter want of caution and consideration in the whole of this affair; yet it did not serve as a lesson. The son of this gallant king sent an army against England in nearly similar circumstances, and on its coming to the destruction which was to be expected, he died of grief. In all of these collisions, the English leaders appear as the wary men. Scotland

seems as a simple reckless child in comparison. Where was Scottish caution on the day of Pinkie fight? In the connection of the affairs of Elizabeth and Mary, on which side lay the astuteness, and on which the impulsiveness? Were the Walsinghams, the Wottons, and the Burleighs, a set of frank heedless Englishmen, allowing themselves to be tricked by the cold calculating ministers of the beauteous queen of Scots?

The national attribute is brought into a strong light in the affair of the Covenant. The king, with England at his back, attempts little changes in the ecclesiastical arrangements of Scotland. In the month of May 1639, this cold-blooded people present themselves in arms on Dunse Law, to bide the worst which that great monarch could bring against them. England had by that time some grievances of her own to bear; but it was the cautious Scotch who first took to pike and gun for the good cause. The affair ends for the meantime in a capitulation; but next year, on a fine day in the month of August, this cool-headed people, once more in arms, are seen crossing the Tweed at Coldstream, in order to fight Charles on his own ground. Their whole conduct throughout the civil war is the oddest possible for a cautious people. After all they had suffered from Charles, twenty thousand of them followed the poor Duke of Hamilton to Uttoxeter, with a vain hope of redeeming their unhappy monarch from the bondage of the sectaries. Not content with thus knocking their heads against Cromwell, they must, two years after, defy him and republican England for the sake of Charles II. Their attack on Oliver at Dunbar, their march to Worcester, are most extraordinary doings for a people eaten up by the spirit of selfish calculation. Never certainly was caution more whimsically shown, or more inappropriately rewarded.

It was the fate of Scotland in the next reign to be put under a church establishment which represented the opinions of only a handful of the people, but which was supported by a powerful and merciless government. The peasantry of a single county rose in rebellion, and fell in scores under the bullets of Dalyell. The peasantry of another county, some years later, exposed themselves in the same way to the sabres of Claverhouse. A thousand of these calculating people were offered liberty if they would say 'God save the king'—the alternative being Barbadoes and Maryland. Strange for a cautious people, they refused, and the cold strand of Orkney was strewn with their corpses before the year was out. What a series of strange proceedings for such a people, those conventicles which they *would* attend, gentles as well as commons, though ruinous fines stared them in the face, and no man knew but Claverhouse might be behind the next hill with his dragoons! The scores of men who, for conscience' sake, sang their last psalms under the gibbet in the Grassmarket, how

strange to think of them as specimens of a nation who, while allowed to have tolerably clear heads, are yet set down as generally distinguished by frigid hearts!

The two rebellions in behalf of the exiled House of Stuart will of course appear as notable illustrations of this national torpor of feeling. In 1745, the Scotch Jacobites came out in thousands to the open field, braving for their principles loss of life and possessions; while the English Jacobites, equally engaged, remain quietly at home, and read of Prince Charlie's progress in the newspapers. Even of the Welsh, hotheaded as they are reputed to be, not a man draws his sword. It is pleasant for a Scotchman to think of eighty of his 'cautious' countrymen getting themselves hanged at Carlisle, Preston, and Kennington Common, for daring to rank themselves up against King George and his army; many of them declaring, too, with their last breath, that, if it were to do over again, they would do it. The affair of 1745 was almost the only occurrence for a century after the accession of the House of Hanover that forcibly attracted the attention of the English to Scotland; and strange to say, it presents this so-called cautious people in an attitude purely romantic, audacious, and unwise.

After ages of war and civil broils, the Scotch bethought themselves, at the close of the seventeenth century, of applying their energies to commerce. The first ventures of so cautious a people one would have expected to be on an exceedingly moderate scale in proportion to their resources. All the circumstances ought to have been marked by prudence and forethought. What was the actual fact?—a plan of extraordinary boldness, for an entrepôt at Darien, involving a capital of four hundred thousand pounds, being about half of the whole circulating medium in the country. The total destruction of their expeditions, and the perdition of their money, bear strong witness indeed to the national attribute! About that time, who was the Scotsman most conspicuous in England?—was he a paragon of caution? It was William Paterson, who projected the Bank of England—one of the most adventurous beings perhaps that ever breathed. Twenty years later, France was thrown into an extraordinary ferment by a new bank, on which came to be engrafted a scheme for colonising Louisiana. The projector was a foreigner, a daring schemer in monetary matters. So successfully did he impart his enthusiasm to others, that people of all ranks flocked to convert their actual capital into his paper. A stranger entering the Rue Quinquempoix at that crisis would have found a hunchback making a good livelihood by letting out his back as an extempore desk on which the transfers of an imaginary stock were negotiated. If introduced at court, he would have found the son of the projector admitted to the circle of noble youths who were privileged to join in the dances of the young king. Strange to say, the man who produced the universal madness in Paris, to be followed by an equally universal ruin, was a member of that nation so celebrated for its cautious calculations: it was John Law, a native of Edinburgh. Banking, it will be said, has been conducted cautiously and successfully in Scotland. Not so fast. The success of Scotch banking arose in reality from a feature of incaution, a large issue of notes. But for the smallness of the country, allowing each man to know something of another's affairs, and the general probity of the men engaged in banking, an issue of notes so much beyond the means of their ready and immediate withdrawal would have been attended by the greatest danger. It has, in fact, been an adventurous system all along, one in which credit has been stretched to an extent which we rarely see exemplified in larger countries. Nor has it been uniformly successful. There are a few counties in Scotland, the proprietary of which has been perhaps as much changed in consequence of misadventures in banking, as Fermanagh was by the Cromwellian settlement. The extreme case was that of Douglas, Heron, and Company's bank, established in 1769, ruined in 1772. They

issued notes like a snow-drift, and gave large quantities of them out to individuals to be put into circulation in different parts of the country, and accounted for at certain periods. These notes used to come back for payment at the central office, before their various circulators had accounted for them. Anybody with a coat on his back and a little brass on his forehead could get a bill discounted with Douglas, Heron, and Company. It is told that there was a back-going farmer about the Pentland Hills, who, having exhausted all his friends and neighbours, and being reduced to desperation, was told that money was to be got almost without ceremony at a house in the Canongate. He came with a bill for L.50, accepted by one of his ploughmen, and had the money in his hand as quickly as if it had been only change for a guinea. He packed it slowly up in his pocket, strode to the door, and there turning coolly about, said pretty audibly, 'Faith, billies, this canna gang on lang!' The damage to the shareholders, who were of all classes, was dreadful. Sir Walter Scott speaks with a bitter grudge of the loss incurred by his father through Douglas, Heron, and Company's bank; yet we observe the old gentleman stands in the list for only L.500 of stock. Mr Islay Campbell, the most successful advocate of his time, told a friend that it would have been better for him never to have made one penny by his profession, than to have made a venture in that bank. Some men paid quotas of loss every now and then during the greater part of their lives; and, as we are assured only a very few years have elapsed since the books were finally wound up, it is not improbable that in some instances the sufferings from Douglas, Heron, and Company's bank extended through three generations.

Any one living in Scotland at the present day, and looking round him with the eye of a man of the world, would be at no loss, we believe, to discover such examples of things done under false calculations, or no calculations at all, as would leave him a good deal at a loss to account for the character which the people have acquired on the score of caution. He would not see what are called 'fast men' in great numbers; but of heedless speculators and half-crazy projectors he would find no lack. However strange it may sound in an English ear, there are plenty of rash and thoughtless people in Scotland. We really must claim to have our fair proportion of folly as well as our neighbours. Only inquire into family histories: where is there one without its wayward member, who is continually coming back upon them ruined and undone, to be once more set up in the world, or once more and finally shipped off for the colonies? Ask in the share-market—look into the Gazette—inspect the shipping list at Glasgow. Hopes you will everywhere find as ripe as fears. On all sides ruin bears its part beside success. One does not hear much now-a-days of such a spirit among religious people as that which fills the history of the sixteenth and seventeenth century with wonders. Yet only in 1843, about a third part of the established clergy of Scotland abandoned their livings on a point of conscience. Other people, ourselves amongst the number, are at a loss to understand their reasons: opposite partisans try to extenuate the matter in various ways. In plain truth, whatever might be the merits of the prompting cause, it was an astonishing example of self-sacrifice, one which any people might be proud to have in their history, and which, we venture to say, the whole nation will yet be proud to see there. We strongly recommend the particulars to the consideration of those who regard the Scotch as wholly made up of cold and selfish calculation.

We might go on to ask if the most eminent Scotsmen of past times have been noted for caution. Was Bruce a cautious man when he exposed himself to the attack of Sir Henry Bohun at Bannockburn? Was John Knox a cautious man?—he of whom Morton said, as he saw him laid in the grave, 'There lies one who never feared the face of man!' Was Mon-

trose cautious at Kilsyth, or Dundee at Killiecrankie? Was Fletcher of Salton cautious when he killed Dare at Torquay? Burns proclaims in his verse that 'prudent cautious self-control is wisdom's root;' but, himself, 'o'er fast for thought, o'er hot for rule,' could never practise the maxim. Scott looked a prudent man till near the end of his days, when it was found that not a son of the Muses in their most reckless times had acted more, inconsiderately than he. A hardy ardour and enthusiasm seems to belong to the whole of the great men of our country. Caution is the last peculiarity which a biographer would attribute to them.

How, then, comes it that the Scotch, with such a history, obtain such a character? We cannot undertake to solve the mystery to universal satisfaction; but we see a few peeps of daylight through it. The Scotch, in the ordinary affairs of life, exhibit a tolerably clear intellect; they do not rush into acts and situations with the precipitancy of the Irish. But there is nothing extraordinary about them in this respect. The English, however, whose judgment on the point is the subject of debate, see their neighbours in two limited aspects. They either see the northern adventurer plodding his way among a people richer than himself, and anxious to make up by prudence for his original want of means; or they themselves come as mercantile travellers into Scotland, seeking to press off all sorts of English goods upon such shopkeepers as they think trustworthy. The Scotch trader has to be on the defensive both against the trading sharpness of the English, and against taking an over-quantity of their goods, all of which he knows must be paid for. He therefore presents a somewhat hard and slow manner to the *empressement* of his visitor. The Scotch are accordingly, as a nation, judged by the English from a few specimens, who are either unfair representatives of the mass, or are presented in circumstances so peculiar, that their actual character is not represented. It is like judging the people of Italy from the wandering image-venders, or the people of France from the conduct of the actors in the Théâtre Français. It gets, however, a specious sort of sanction from the fact, that the Scotch do bear themselves with something like an average degree of prudence amongst the nations; and so it passes. The English, meanwhile, have no more idea of the style of living and dealing pursued by the bulk of the Scotch people, than they have of the *ménage* of an Esquimaux, or perhaps less. The many who live in an open-handed and elegant manner, the still greater number who live in comfort, the generous charities supported in the large towns, the sacrifices made by the poorest under the influence of their higher sentiments, remain totally unknown, and therefore enter not into the account. If these remarks do not explain the mystery, then we despair of it, and must leave it as a problem to be solved by wiser heads than ours. R. C.

AN ENGLISH WORKMAN'S RECOLLECTIONS OF PARIS IN 1848.

SECOND AND CONCLUDING ARTICLE.

AFTER the Revolution, business of all kinds seemed to have received a decided check. Work at M. Jolly's was not resumed for more than a week, and then only on short time. Thousands walked the streets without any employment at all, excepting planting trees of liberty, which they did at every possible place, amid great firing of guns and other rejoicings. M. Vachette, my landlord, was one who suffered much from the late changes, for he had been employed by the royal saddler and harness-maker. To compensate him in part for his loss, he had been chosen by his comrades as corporal in his company of the National Guard. Although feeling sorely the pressure of the times, he managed to save a small weekly sum towards his uniform. He was a gay thoughtless being enough, with sparkling black eyes, and a black bushy beard, and a devoted admirer of republican principles as advocated by Vergniaud,

Bailly, Roland, Brissot, and other Girondins, and so ably contended for now by Lamartine. He saw with pain the wide spread of Communism. His wife, a woman of good education, and much natural talent, seemed in a continual melancholy, as if under some foreboding fear that she could not contend with.

About this time my friend George, finding his hopes of obtaining employment in Paris at an end, was compelled reluctantly to quit the bosom of his family, and to go to sea once more. James Bagues, his brother, who was a man of excellent disposition, and a sincere lover of his species, had for his abilities been chosen secretary of one of the most violent democratic clubs, and was himself imbued with a corresponding quantity of their enthusiasm and folly.

The first act of the Parisian workmen was, by threats held out to their employers, to expel all the English employed in Paris; and indeed, as I afterwards found, this was pretty general throughout France. The only excuse I can find for this conduct, was the misery and destitution they were suffering themselves. This gave rise to much bitterness of feeling on the part of my countrymen, and not without cause. It was a sad blow for the keepers of English houses in Paris, as they were nearly all obliged to close their shops and follow their customers.

My own work continued very slack for some time after the Revolution; but I had the pleasure of observing that the branch of the business in which I was employed gradually increased, which I attributed to the superiority of the English method over the French. Accordingly, as the spring advanced, I found full employment, occasionally even working five quarters in the day, though trade in general was extremely dull. Still no symptoms appeared of the wretchedness of the majority of the working-classes. The people, everywhere decently clad, laughed, looked happy, and sang their songs with that *gaieté du cœur* for which the Parisian stands unrivalled.

On the 16th of April, there was a great Communist demonstration; the *rappel* was beating in all quarters of Paris. The day passed without any particular disturbance; but it caused trade, which was slowly reviving, again to languish. I found every such popular demonstration followed by a corresponding depression in business; for the rich, alarmed by the constant marching of immense bodies of men, beating their eternal drums, were rapidly leaving Paris, thus rendering employment still more scarce, and the masses still more discontented. To provide for the wants of the working-classes, the *Ateliers Nationaux* were instituted, which, to my thinking, was a fatal mistake on the part of the government, as a complete system of organisation was at once framed, which, as was afterwards shown, was fully taken advantage of.

On the 20th took place the Festival of Fraternity, which exhibited no extraordinary feature besides the astonishing length of the line of troops which passed in review before the members of the Provisional Government. It was generally believed after this fête that trade would revive; but those who thus fondly hoped, were doomed to disappointment. Trade in all branches, instead of getting better, got worse. Thousands of discontented and hungry men roamed through the streets, by their threatening appearance making bad worse. I was particularly struck with the appearance of poor James Bagues and his wife, whom I had not seen for some time past. Although in their dress there was an evident struggle between pride and poverty, and no tale of distress came from their lips, yet their pale and famished looks told how much they had suffered. On this occasion the conversation naturally turned to the existing state of things in Paris, and rather a hot discussion ensued between the two brothers-in-law, James contending that the men now at the head of affairs had betrayed the trust reposed in them, and that nothing but their expulsion would save France from ruin. The other threw

the whole blame on the Communists, who, by their constant *émeutes*, had ruined the trade of Paris. It ended by M. Vachette commanding James to leave the room, which he did, never again to cross the threshold. I was much grieved, on account of the two sisters, that politics should thus part friends, and different opinions engender such bitter feelings.

As summer approached, the weather became delightful. I had heard and read of sunny France. Her poets had apostrophised her bright blue skies, and sung in raptures of her corn-fields and vineyards: I found the picture not overdrawn. The sky was bright and beautifully clear for many weeks together. From the absence of smoke, there was a particular freshness in the air, by which the intense heat of the sun was much relieved. The Boulevards now swarmed with people, especially on Sundays, which here is a kind of fête-day, instead of being set apart for religious observance. Jugglers, tumblers, and showmen lined the path; bands of music sounded in the air; while all kinds of vehicles crowded along the road. In the evening, the cafés were filled with company, thousands being seated outside in the cool of the evening, enjoying the soothing fragrance of the cigar and sipping their coffee, and the ladies their sugared water. The Boulevards outside of Paris were, if possible, more gay. From the numerous cafés, ball-rooms, and summer-gardens, the sound of song and revelry met the ear, instead of the more decent tolling of the Sabbath-bell.

On the 15th of May Paris was again thrown into a state of ferment by the attack of the Communists on the National Assembly. Some of my shopmates I knew to be adherents of Barbès, Blanqui, and the other Communists; and I noticed their absence on this particular morning. The drum beat the *rappel*, and again shops were shut, and the streets filled with military. I hastened down to the hall of the National Assembly, the front of which was guarded by a troop of dragoons, while immense numbers of the Garde Nationale were hastening down the quais.

I was standing nearly opposite the Chambers when Lamartine and Ledru-Rollin left the Assembly on horseback. A thousand voices cried, 'Vive Lamartine!' and a few, 'Vive Ledru-Rollin!' Many pressed forward to shake the former by the hand. I, wishing to have that honour, pressed forward with the rest, and grasping his hand a little too tightly I fear, cried at the top of my voice, 'Vive Lamartine!' I felt as if it was something to have shaken hands with the then greatest man in all France.

The fête of Concord followed quickly afterwards: it was a most splendid affair, but failed to produce the contentment which was expected of it. As for myself, I had no great reason to complain: my work still increased, and I fondly hoped that I might be allowed to remain many years in the land of my adoption; my master was kind and indulgent, using me more as an equal than was in partnership with him than as a workman employed by him; my shopmates were courteous and obliging; the climate I felt to be delightful; all public places were free; and the manners of the people such as made me blush for the ignorance and rudeness of my own.

My prospects in business being so cheering, I resolved to purchase a little home, and send for my family. I immediately began to put this resolution into effect, and, living frugally and working hard for the next five or six weeks, purchased at every opportunity such articles of household furniture as I judged would be most serviceable. Amongst these were a bed mattress and bedstead, a rather stylish chest of drawers with a marble top, a table, some chairs, and a looking-glass. The articles, as I bought them, were placed in a room which I had taken in the Rue Faubourg St Martin. It was with some degree of pride and satisfaction that I looked round my little apartment, longing for the time when I should behold my wife and children once more comfortably settled beside me. I had meanwhile written to

my wife, directing her to sell to the best advantage our household goods at home, and likewise a small business which had formed the chief support of my family. It was with great reluctance that I informed Monsieur and Madame Vachette of my intention to leave them, as they had treated me with uniform kindness, and I knew my money, trifling as it was, was now an object with them.

Upon further consideration, seeing the difficulties my wife would have to encounter on her journey with four young children, I thought it would be better for me to ask a week's holiday, and fetch them from England myself. A week previous to my intended departure, which I had fixed for Sunday the 25th of June, as it was the last Sunday I should spend in the Battignolles, I went, in company with my landlord and his wife, to Versailles, M. Vachette having an uncle residing there. On the previous night he had brought home his new uniform, and now for the first time put it on. He had, in common with most Frenchmen, a smart military air, and, with the help of some padding, made really a handsome figure. So to Versailles we went, and spent the day most comfortably, all little imagining how the next Sunday would pass.

I had noticed every evening, on leaving my work, bands of idle fellows loitering about the Portes St Martin and St Denis. These mobs the military were called out several times to disperse; and it was no unusual thing to find both horse and foot at the Porte St Martin as I was returning from work.

On the evening of Friday the 23d, as I was preparing to leave work, I was alarmed by the noise of a sharp firing in the street. I quickly dressed, and ran out. All was confusion and alarm. Rebellion again had reared its hydra head, and the fair city of Paris was about to become an immense slaughter-house. A barricade had been formed at the Porte St Martin, before which several of the Garde Nationale had already fallen.

As I had no wish this time to take any share in the movement, I avoided the Boulevard by taking by-streets, until I reached the Rue de la Chaussée d'Antin. The *rappel* was now beating in every quarter, and the Garde Nationale mustering in great numbers. Armed men passed me every moment; but of which party it was impossible to judge, as thousands of the Garde Nationale were without uniforms. I rushed across the Boulevard, and then up Rue de la Chaussée d'Antin to Rue Clichy. I passed through the barrier of that name, and reached my lodgings in Rue de l'Ecluse in safety. I had not been at home many minutes, when M. Vachette, who worked in the Rue St Honoré, entered. The *rappel* now sounded loudly in the Battignolles. I helped my landlord to equip, belted on his sword and cartridge-box, and handed him his gun from the corner in which it was usually kept. He shook me by the hand, kissed his wife, and then departed.

I endeavoured to calm the agitation of Madame Vachette, by assuring her that it was nothing but an ordinary *émeute*, of which several had lately taken place. So, wishing madame good-night, I took my lamp, and retired to my chamber.

At daybreak I was awake by something jarring my window, which, from the heat of the weather, I had left unfastened. Suddenly it shook again, and the boom of cannon struck my ear. I sprang from my bed, and threw back my window. The first streaks of day had just begun to crimson the eastern sky. A sharp, quick knocking at my door, and the voice of my landlady calling me, drew me from the window. I threw on some articles of clothing, and admitted her. With pale and quivering lips she besought me to make some inquiries as to the cause of the firing. I promised her I would, and went out with that intention.

On ascending the hill of Montmartre, which stands at the distance of a short walk from the Battignolles, and commands a fine view of Paris, I saw the white smoke of the combat already curling above the houses. The discharges of artillery became every moment more fre-

quent, mingled with the rattling of musketry, until the whole became one deafening roar, as the combat was more general, and the line of action more extended. I returned to my lodgings, and found my poor landlady in a sad state; her anxiety respecting her husband and other relations in Paris being very great. She expressed her determination to proceed in search of M. Vachette, in spite of all dangers that she must necessarily be exposed to. At her earnest intreaty I consented to accompany her, knowing that, from the politeness of the French of all grades towards a female, my protection to her was a guarantee for my own safety. Avoiding the quarter in which fighting was going on, we reached the Boulevards by the way of Rue d'Amsterdam and the Madeleine. The Boulevards were crowded with troops, and several pieces of cannon passed on their way to the scene of combat. On making inquiries of an officer as to the station of the legion from the Battignolles, he politely informed us that they had passed the night in the gardens of the Tuileries. This for the present somewhat calmed poor Madame Vachette's apprehension.

We now proceeded to Rue St Honoré, where resided her father. The old gentleman very much blamed our rashness in venturing out amid such a scene; so, leaving her with her father, I endeavoured to reach the Tuileries; but all approach was strictly forbidden. I next endeavoured to reach the Rue de la Harpe; but even approach in that quarter was cut off, either by the military, or by enormous barricades. As I had no wish to be again concerned in the making of street defences, I in every possible manner avoided coming in contact with the men employed in their construction. Having thus failed in every effort to obtain intelligence, I returned to Rue St Honoré, and taking Madame Vachette again under my protection, proceeded home.

Night at length closed upon the long day of Saturday, during which the cannon had thundered without intermission; and when at last the twilight of a short night in June shrouded the dying and the dead, the sky was crimsoned in many places by the light of conflagration. Sleep that night visited but few eyes in Paris, unless it was the sleep of death, which now weighed heavily on thousands who had risen hale and hearty with the morning's dawn.

All night was heard the heavy tramp of armed legions, and the clattering of horses' hoofs, with the jingling of sabres and accoutrements, as the troops continued to pour into Paris from the provinces. On the following day (Sunday) the combat increased in fury, approaching still nearer our immediate locality; and a tremendous cannonade being directed on Barriers Rochechouart and Poissonniere, both of which were plainly discernible from our windows.

The sight was one of extreme horror. From the immense strength of these two positions, the carnage in attempting to take them was very great. Notwithstanding that the cannon thundered at them from day-break till dusk, they still remained in possession of the insurgents. The streets of the Battignolles were now swarming with troops, and the houses filled with the dying and the dead. As for poor Madame Vachette, she sat the image of despair, rocking her body to and fro in mental agony. No food had yet passed her lips. Again we passed a wretched night, and again the thunder of artillery aroused me from a sort of dose that I had fallen into towards the morning. As the day advanced, the firing slackened, and then ceased. The insurrection was now quelled, and the silence of death succeeded the roar of the cannon.

The legion of the Battignolles returned at night, and many anxious wives rushed from rank to rank. There were joyful meetings of friends, and piercing shrieks of agony and wo from wife and daughter when those they sought returned not. One such scream burst from the lips of poor Madame Vachette, as she sank in strong hysterics on the ground, although his comrades assured her that her husband was only wounded.

I went with her next day to the Hôtel-Dieu, to inquire after him, and the dreadful sights that everywhere met our gaze make the heart ache to think of. On arriving at the gate of the hospital, we found a melancholy group surrounding it with pale faces and tearful eyes, all anxiously waiting to ascertain the fate of near and dear ones. There was a long interval of painful anxiety, and then came the dreadful truth: poor M. Vachette was numbered with the dead! He had died of his wounds immediately on his admission.

His wife, poor soul, bore this stroke better than I expected. No tears this time; although, when the fatal truth was made known, a groan burst from her lips as if her very life would leave her body. Her eyes were dry and bloodshot with long watching; her lips no longer pale, but black and parched, as with fever. She begged to see the corpse in a low husky voice, that showed what ravages grief had already made on a constitution at all times delicate. Those whose visits have only been confined to an hospital under ordinary circumstances, can form no idea of the horrors of the scene, or the fearful medley of dreadful sounds that struck the ear. The low moan of agony, the wild cry of some who were delirious, and the still louder shrieks of those undergoing painful surgical operations, combined to produce a most appalling effect. We passed through many long lines of poor suffering wretches, many of whom closed their eyes with no friend to minister to their last wants—to wet the parched lips, to lift the aching head or smooth the pillow, or to give up with them the last prayer to the throne of mercy. In many cases the last sounds that fell on their dying ear were the wild imprecations and fearful yells that came from the lips of a new-made madman, whose disordered fancy still kept wandering to the scene of the late fearful conflict.

Soon we were in the hall of death, and a heart-rending scene it was. Although some attempt had been made to give the dead a decent appearance, yet the majority were sadly disfigured with wounds and clotted gore. The eyes of the wife were quicker than mine, for I was occupied in viewing the frightful cuts and slashes that some of the bodies exhibited, while many, very many, only showed a small blue mark to tell the manner of their death. She grasped my arm, as if to prevent herself from falling, stopped short for a moment, and gasped for breath. My eyes mechanically followed the direction of hers; and there he lay, poor fellow, still in his uniform—for he was either dead when brought in, or died immediately afterwards. She stooped down to kiss his pale bloodless lips, the cold contact of which seemed to freeze her very heart. She trembled in every limb, and her teeth chattered. I bore her unresistingly away from this painful sight, and with a heavy heart returned to the Battignolles.

Being anxious to ascertain the fate of my friends, I returned towards the quarter Latin, in which was situated the Rue de la Harpe. My journey to this place was one of extreme difficulty, for I was stopped and searched in every quarter. In some places I had to scramble over high barricades half destroyed, and then wade knee-deep in mud, passing perhaps under buildings that threatened every moment to fall and crush the luckless passenger. In many places I was repulsed and forced back by the military; and when permitted to proceed, only in company of one or more of the Garde Nationale or Garde Mobile. At length I reached the Rue de la Harpe, and mounted the many stairs to the apartment of James Barges. I rang softly at the bell. The door was opened by his wife. On seeing me, the first word she uttered was, 'Have you brought me any news of my husband?' Upon inquiry, I found that he too had been absent since the fatal evening of Friday. Poor soul! the consolation that I could afford her was small indeed. His fate I could but too readily guess: he was either with the slain, or languishing in the dungeons of the Tuileries. The party he would embrace in the conflict I knew too well.

I now thought it would be well to see how matters stood with myself. I passed those places where the fighting had been thickest. Everywhere the traces of the fearful conflict were visible. On the Quai aux Fleurs, a large clothing establishment, where, a few days previous, I had purchased a pair of trousers, was now riddled with cannon balls. I crossed Pont Notre Dame to the Rue St Martin. Our establishment was closed, the masters mounting guard somewhere, and no one to give me any information.

Passing through Porte St Martin to the Faubourg, I found the traces of the struggle still more evident. Barricades half-destroyed continually impeded the progress of the passengers. On reaching the house where I had placed my goods, I found it turned into a temporary guardhouse, and it was occupied by a party of the Garde Mobile. I inquired for the *concierge*. He had disappeared. I asked permission to visit my apartment. The man on guard shrugged up his shoulders, and said I might please myself about that. I thanked him, and mounted the stairs; when, oh my poor *ménage*, what a wreck! My bed and mattress had disappeared, doubtless for the service of the wounded: my drawers—doubtless the marble top had broken the head of some luckless wight in the street below. The last of my bedstead was burning on the hearth, cooking the mess for the soldiery. I returned to the Battignolles very low-spirited indeed, and there found a note from my employer, recommending me to remain some time in England until better days should permit me to return to Paris, as he thought London for the present presented a better chance of success. So I prepared to depart from this city of mourning and desolation. Previous to my departure I again visited Madame Bargues, in company with her sister. The meeting of the two was very affecting. Both were alike bereaved; for my fears were too well-founded: James had been taken with the insurgents, and now awaited a court-martial in the dungeon of the Tuileries. The rest is told in a few words. On my return to England, I found that my wife, acting on my instructions, had broken up our little home, and parted with her business. So I found myself in no enviable situation. But my case is not an isolated one of the misery brought by civil war.

W. E.

SKETCHES OF THE HISTORY OF EDUCATION.

MONTAIGNE—RATICH.*

EDUCATION, according to the idea of it which prevailed during the period from the revival of letters to the sixteenth century, was confined to a repetition of the words and theories of the ancient authors and philosophers. The object was only to know what they said, not what was right. The efforts of Erasmus, of Melancthon, and, above all, of Luther, and the influence of the greater diffusion of knowledge, introduced a more extensive course of instruction; and the new school boasted that they taught realities instead of the pedantic verbalism of the old. And yet the difference was not so great as was imagined. History and science were taught, not for themselves, but with a view to the elucidation of the classics, and they were taught on the old principle of authority instead of experiment. Astronomy was learned without observation of the stars; anatomy without dissection; botany without botanising; everything was taught from books, implicit faith being still given to the theories of Aristotle, Pliny, and Galen; and nature herself, when she was investigated, was so, not in order to correct the authorities, but only in order to come round again to, and explain the infallible books. This was *verbal realism*—the teaching of things not by the understanding, but the memory. It was when education had reached this stage of development that the system of Bacon, producing realism in philosophy,

produced realists in education also. The great principle of this school was, to teach things instead of words; and their method, to teach through the understanding instead of the memory. Accordingly, the general characteristics of the new system, as displayed at its birth, may be stated as follows:—They asserted the necessity of teaching the arts and sciences, history and modern languages—in short, knowledge in general, as well as the classics, and maintained the practicability of teaching both simultaneously. With regard to their method of teaching, they attacked the universal domination of the Latin language, and took the mother-tongue as the foundation of all education; their special objection was to the 'memory-cramming' of the old system, which, said they, is dead and useless, since the pupils are made to learn by heart much which they cannot understand, and yet that which is understood can alone be impressed on the memory.

Before passing to those individuals whose systems were the direct offspring of the Baconian philosophy, it is necessary to advert to a man who, living contemporaneously with Bacon, certainly was not in anyway indebted to him for his opinions, and yet whose views bear the strongest analogy to those subsequently developed by the systematic realists, under the influence of the inductive philosophy. This man was Montaigne. His remarks, from the very circumstance, perhaps, that he had no practical experience of teaching, are as acute as they are original; whilst in his writings may be found the germ of much which was broached long afterwards as newly discovered, by authors who were not candid enough to own their obligations to the Gascon philosopher. As a whole, Montaigne's idea of education was thoroughly realist; not that his works contain any digested system. None of the works of this vivacious author can be called systematic, except in their egotism. The man himself is the centre on which all his reflections turn, and he scatters his opinions abroad, crude and unconnected, as they occurred to himself. This being the case, we shall not attempt to reduce Montaigne's observations to any system, but content ourselves with quoting such portions of his writings as may best illustrate his views.

'The end of study,' he observes, 'is to become wiser and better, and the object of the tutor should be to make his pupil a man of abilities rather than a mere scholar.' Proceeding on this principle, he inveighs against the pedantic learning then in vogue. 'We take pains only to stuff the memory, and leave the understanding and the conscience unfurnished.' We can exclaim, says Cicero, these were the morals of Plato; these the very words of Aristotle; but what do we say ourselves that is our own? Compare in the man truly educated one of those college Latinists, who has thrown away fifteen or sixteen years in only learning to speak. We are subjected four or five years to learn the meaning of words, and to tack them together into clauses; as many more to distribute one copious discourse into four or five parts; and the remaining five years at least to learn succinctly to mix and interweave them after a subtle manner.' And he goes on, as an illustration, to relate a story of his meeting two scholars, one of whom being asked, with regard to his companion, what gentleman that might be, replied, 'He is not a gentleman; he is a grammarian, and I am a logician.' 'Now, we who, on the contrary, do not aim to form a grammarian or a logician, but a gentleman, leave them to misspend their time: our business lies another way; for let our pupil be well furnished with things, words will flow but too fast; he will drag them after him if they are not ready to follow.' For the word gentleman, here substitute man, and the object of education, according to the realists, is described almost in their own words. In the same spirit Montaigne maintains that education ought to be the teaching to think for ourselves, rather than to repeat the thoughts of others. 'The tutor should at the very first, according to the capacity of his pupil, begin to put it to the test, by

* An article presenting the opinions of three earlier educationists appeared in No. 206.

permitting his pupil himself to taste things, and to choose and distinguish them, sometimes opening the way for him, and sometimes not. For if he embraces the opinions of Xenophon and Plato, in his own conviction these opinions will be no longer theirs, but his. He that follows another follows nothing, finds nothing, nay, does not seek for anything. To know by rote is no knowledge.'

Since Montaigne's plan is thoroughly to inform the mind, he insists much on the necessity of studying history, and especially what we now call the philosophy of history; and he also recommends travelling, and an early acquaintance with, and an interest in, the events and opinions of the day. Since, too, he was to educate the whole man, his system comprehends the training of the body as well as the mind. Pursuing in everything his realist crusade against teaching without experience, he exclaims, 'I could wish that Palnel or Pompey, those famous dancing-masters of my time, could have taught us to cut capers by only seeing them do it, without ever stirring from our seats, as these men pretend to improve our understanding without exercising it; or that we had learned to ride, handle a pike, touch a lute, or sing, without the trouble of practice, as these pretend to make us think; and speak well without exercising either our judgment or our voice.' In all these points we shall presently see the exact similarity of the opinions of Montaigne to those of the systematic realists; and in another point of still more importance there is the same agreement—the uselessness and impropriety of harshness. 'Away with this force, this violence,' says he: 'youth should be allured to instruction, not driven to it, that where their profit is, their pleasure may be also.' As a last hit at the pedantic quibbles of the schools, he asks, 'But what shall our young gentleman do if he be attacked with the sophistical subtlety of some syllogism? A gammon of bacon makes a man drink, drink quenches thirst; *ergo*, the bacon quenches thirst. Why let him laugh at it, and it will be the more discretion to do so than to answer it.'

Essentially realist as Montaigne was, his writings do not appear to have exercised much direct influence on the earlier educationists who professed the same opinions. The first of the systematic realists was Wolfgang Ratich, who was born in Holstein in 1571. His general idea will be best understood by a short account of his method of teaching Latin, on the analogy of which he formed his method of instruction in all branches of learning.

Ratich rejected the old system of teaching the grammar in the first place, and then proceeding to read; on the contrary, he chose Terence, as being the Latin author best known by translations, and insisted on each play being read once, twice, or even three times in German before proceeding to the original. The teacher was then to go over the play, act by act, and scene by scene, explaining the drift and meaning thereof, as if the translation were in the hands of the class. He then went over the whole scene, translating word by word from the Latin, the pupils listening; a second verbal translation was then made, the pupils repeating word by word after the teacher; and lastly, they translated it themselves in the same manner, the teacher assisting them in any difficulty. When the author had thus been concluded for the third time, the class proceeded to the grammar (written in Latin), which was expounded to them in the same manner as that pursued with Terence, analogies to the German grammar being pointed out. Each particular portion of the grammar was then translated word for word several times, each rule being illustrated by examples chosen from Terence. Short sentences analogous to examples given in the author were then translated from German into Latin; and lastly, written exercises on the same principle were composed and corrected. The first step having been thus thoroughly mastered, the pupils proceeded to other authors.

The system of classical teaching above described presupposes a thorough mastery of the mother tongue. Strange, however, as it may seem, Ratich's original plan was, to proceed to Latin as soon as the merest elements of reading had been acquired in the mother tongue, or rather to teach those elements in Latin. His disciple Kromayer rejected this doctrine, maintaining that pupils must first of all learn German thoroughly before applying to Latin or any other foreign language, 'for as it is absurd to give children Latin books until they can read German perfectly, it is still worse in the very beginning, before they can read at all, to teach them to read in Latin primers.' With this view, Ratich's disciple commenced by teaching to read in German, using the Lutheran Bible as his class-book. The pupils were taken over their lesson several times, word by word, in Ratich's fashion, applying the grammar in their later perusals; and it was not till they were thorough masters of the reading and grammar of the mother tongue that Latin was attempted.

Preposterous as the attempt to teach the elements of reading and spelling in a foreign tongue appears in the present day, we must remember that the exactly analogous absurdity of teaching the rudiments of Latin grammar by means of books written in that language, has only very lately been abandoned in our own schools, if indeed it can yet be said to have altogether fallen into desuetude. Ratich's idea seems to have originated in a yet lingering feeling of the far superior importance of Latin as compared with the mother tongue. He could not divest himself of the old superstition, that Latin ought to be the mother tongue of the educated man. Montaigne, whose shrewd common sense ought to have guarded him against such an error, is liable to the same imputation. He describes, as highly to be recommended, the system under which he was himself taught. His eccentric father conceived the plan of never allowing his son, even in his earliest years, to hear or to speak any language but Latin, the result of which was that the boy was upwards of six years old before he could understand French, although he spoke Latin perfectly. To say nothing of the impracticability of such a system in the vast majority of cases, the question of the advantage to be derived still remains. In Russia, the native language used to be considered so vulgar and inelegant as to be unfitted for the use of those of gentle rank; fashionable people were ashamed to own that they understood it, and children were consequently trained from infancy to speak French. If all other nations are contented to look on their own language with Russian contempt, they may take to Montaigne's system; but the reason for such a preference has yet to be shown. The same observations do not apply, however, to the practice of making a foreign language, and especially Latin, the foundation on which the rudiments of grammar are taught. The pupil's familiarity with the idioms of the mother tongue, renders the application and comprehension of exact rules in regard to it a perplexing task; whilst, viewed abstractly, apart from the meaning of the words, which is of course to be given at the same time, there is no more difficulty in explaining a grammatical principle by means of a language imperfectly, than one thoroughly mastered. On the other hand, to say nothing of the superiority, as regards regularity of construction, of the Latin over most modern languages, the very unfamiliarity gives each rule, as clearing away an obstacle to translation, an importance otherwise unfelt. In the one case, the mother tongue has to be learned over again; in the other, each advance made in the grammar of a foreign tongue insensibly throws a light upon the construction of our own. 'The advantages of Ratich's system,' says one of his followers, 'are, that useful sciences and languages can be more easily, expeditiously, and correctly taught, than they ever have been. By his method, either young or old may in a year, or even in half a year, learn any language as thoroughly as their mother tongue; and the

same method is still better adapted for instruction in the arts and sciences, since these are, by their nature, free from the anomalies which have crept into language.'

That a superficial knowledge of languages and science may, by a system of preceptorial repetition such as Ratich's, be easily picked up, is true enough; but it is a very different question whether that knowledge will be as thorough and as essentially beneficial as if the pupil had devoted his individual energies to the acquisition. Ratich's method is neither more nor less than a more laborious form of the Hamiltonian system of interlinear translation. The whole labour, with the exception of a mere act of memory and attention, devolved on the teacher: he was to explain, to expound everything; the pupil had nothing to do but to listen and to follow. The effect of this can scarcely be called questionable. When to the labours of the teacher he added the greater part of the labours of the scholar, Ratich forgot his own principles, and fell into the very error against which himself and Montaigne declaimed so vehemently, of depriving his pupils of all freedom of thought and mental action.

'For to distract the attention with several things at once, is as absurd as to try to cook porridge, meat, milk, and fish in the same pot.' But was Ratich's procedure according to the order of nature when he surfeited his pupils day after day with translation upon translation of the same play by the same author? Is not a change of study just as necessary as a change of diet? Would it be according to the order of nature to keep a school for eight months on a particular kind of meat or fish, without a piece of bread or drop of milk, as Ratich kept his for eight months hammering at Terence? Again: 'Too great a reliance on memory is injurious to the understanding and apprehension of the thing taught; since, in attaining this one object of remembering, the mind is bound down to the word alone, and no room is left for a consideration of the thing. Moreover, the labour itself is unnecessary, there being a far better method of attaining the same object; for when a thing is by frequent repetition thoroughly pictured to the understanding, the memory retains it of itself without any farther trouble.' And so one of his golden rules is the necessity of frequent repetition. But what is repetition but a committing by rote—nay, what is Ratich's whole system but a committing of translation by heart, with this peculiarity, that the teacher is brought in for an immense share of the merely mechanical labour?

In making these observations, it is not to be supposed that anything more is intended than to expose the fallacy of Ratich's theory—that it is possible altogether to dispense with learning by rote. There can be no greater absurdity than that of loading the memory without informing the understanding, and on this point it is impossible not to see the force of Ratich's rules, 'First, the thing itself, then the manner of the thing,' and 'Everything by experiment and practical observation'—or, as the Latinists have it, 'Per inductionem et experimentum omnia.' 'It is useless,' says he, 'to give rules until you have given the author and the language. For what use can he make of any language who has never read a single author in it, though he be stuffed full of rules? A careful and compendious course of reading will teach the rules and the application of them. The rules, then, ought to be taught, neither as the preparation nor as the foundation, but in order to confirm and fix in the mind the thing taught. And so every rule must be tested and explained by the examples found in the course of the pupil's own reading.' Might not attention to these remarks obviate many a weary hour now spent over '*Propria quæ maribus*,' and such like?

From these remarks it will be seen how it was that Ratich, the earliest of the systematic realists, fell into that error which we have described as the stumbling-block of all his brethren—namely, that though he laid

down true principles, he was not in practice true to his own principles; or, as the Swedish Chancellor Oxenstiern expressed it, he exposed the evils of the prevailing system well enough, but the remedies which he proposed were scarcely adequate to cure them.

As the foundation of his system, Ratich enounces several principles, most of which are sound enough in themselves; it is only the application of them to his method which appears difficult. Thus he maintains that everything must be done according to the course of nature; that only one thing is to be attempted at a time; and that no new thing should be undertaken until all which preceded it has been thoroughly mastered. In each language a particular author is to be chosen, from whom that language is to be learned, and others are not to be read till this has been completely digested.

EXPERIENCES OF A BARRISTER.

THE MARCH ASSIZE.

SOMETHING more than half a century ago, a person, in going along Holborn, might have seen, near the corner of one of the thoroughfares which diverge towards Russell Square, the respectable-looking shop of a glover and haberdasher named James Harvey, a man generally esteemed by his neighbours, and who was usually considered well to do in the world. Like many London tradesmen, Harvey was originally from the country. He had come up to town when a poor lad to push his fortune, and by dint of steadiness and civility, and a small property left him by a distant relation, he had been able to get into business on his own account, and to attain that most important element of success in London—'a connection.' Shortly after setting up in the world, he married a young woman from his native town, to whom he had been engaged ever since his school-days; and at the time our narrative commences he was the father of three children.

James Harvey's establishment was one of the best frequented of its class in the street. You could never pass without seeing customers going in or out. There was evidently not a little business going forward. But although, to all appearance, a flourishing concern, the proprietor of the establishment was surprised to find that he was continually pinched in his circumstances. No matter what was the amount of business transacted over the counter, he never got any richer.

At the period referred to, shopkeeping had not attained that degree of organisation, with respect to counter-men and cashiers, which now distinguishes the great houses of trade. The primitive till was not yet superseded. This was the weak point in Harvey's arrangements; and not to make a needless number of words about it, the poor man was regularly robbed by a shopman, whose dexterity in pitching a guinea into the drawer, so as to make it jump, unseen, with a jerk into his hand, was worthy of Herr Dobler, or any other master of the sublime art of jugglery.

Good-natured and unsuspecting, perhaps also not sufficiently vigilant, Harvey was long in discovering how he was pillaged. Cartwright, the name of the person who was preying on his employer, was not a young man. He was between forty and fifty years of age, and had been in various situations, where he had always given satisfaction, except on the score of being somewhat gay and somewhat irritable. Privately, he was a man of loose habits, and for years his extravagances had been paid for by property clandestinely abstracted from his too-confiding master. Slow to believe in the reality of such wickedness, Mr Harvey could with difficulty entertain the suspicions which began to dawn on his mind.

At length all doubt was at an end. He detected Cartwright in the very act of carrying off goods to a considerable amount. The man was tried at the Old Bailey for the offence; but through a technical informality in the indictment, acquitted.

Unable to find employment, and with a character gone, the liberated thief became savage, revengeful, and desperate. Instead of imputing his fall to his own irregularities, he considered his late unfortunate employer as the cause of his ruin; and now he bent all the energies of his dark nature to destroy the reputation of the man whom he had betrayed and plundered. Of all the beings self-delivered to the rule of unscrupulous malignity, with whom it has been my fate to come professionally in contact, I never knew one so utterly fiendish as this discomfited pilferer. Frenzied with his imaginary wrongs, he formed the determination to labour, even if it were for years, to ruin his victim. Nothing short of death should divert him from this the darling object of his existence.

Animated by these diabolical passions, Cartwright proceeded to his work. Harvey, he had too good reason to know, was in debt to persons who had made him advances; and by means of artfully-concocted anonymous letters, evidently written by some one conversant with the matters on which he wrote, he succeeded in alarming the haberdasher's creditors. The consequences were—demands of immediate payment, and, in spite of the debtor's explanations and promises, writs, heavy law expenses, ruinous sacrifices, and ultimate bankruptcy. It may seem almost too marvellous for belief, but the story of this terrible revenge and its consequences is no fiction. Every incident in my narrative is true, and the whole may be found in hard outline in the records of the courts with which a few years ago I was familiar.

The humiliated and distressed feelings of Harvey and his family may be left to the imagination. When he found himself a ruined man, I daresay his mental sufferings were sufficiently acute. Yet he did not sit down in despair. To re-establish himself in business in England appeared hopeless; but America presented itself as a scene where industry might find a reward; and by the kindness of some friends, he was enabled to make preparations to emigrate with his wife and children. Towards the end of February he quitted London for one of the great seaports, where he was to embark for Boston. On arriving there with his family, Mr Harvey took up his abode at a principal hotel. This, in a man of straitened means, was doubtless imprudent; but he afterwards attempted to explain the circumstance by saying, that as the ship in which he had engaged his passage was to sail on the day after his arrival, he had preferred incurring a slight additional expense rather than that his wife—who was now, with failing spirits, nursing an infant—should be exposed to coarse associations and personal discomfort. In the expectation, however, of being only one night in the hotel, Harvey was unfortunately disappointed. Shipmasters, especially those commanding emigrant vessels, were then, as now, habitual promise-breakers; and although each succeeding sun was to light them on their way, it was fully a fortnight before the ship stood out to sea. By that time a second and more dire reverse had occurred in the fortunes of the luckless Harvey.

Cartwright, whose appetite for vengeance was but whetted by his first success, had never lost sight of the movements of his victim; and now he had followed him to the place of his embarkation, with an eager but undefined purpose of working him some further and more deadly mischief. Stealthily he hovered about the house which sheltered the unconscious object of his malicious hate, plotting, as he afterwards confessed, the wildest schemes for satiating his revenge. Several times he made excuses for calling at the hotel, in the hope of observing the nature of the premises, taking care, however, to avoid being seen by Mr Harvey or his family. A fortnight passed away, and the day of

departure of the emigrants arrived without the slightest opportunity occurring for the gratification of his purposes. The ship was leaving her berth; most of the passengers were on board; Mrs Harvey and the children, with nearly the whole of the luggage, were already safely in the vessel; Mr Harvey only remained on shore to purchase some trifling article, and to settle his bill at the hotel on removing his last trunk. Cartwright had tracked him all day; he could not attack him in the street; and he finally followed him to the hotel, in order to wreak his vengeance on him in his private apartment, of the situation of which he had informed himself.

Harvey entered the hotel first, and before Cartwright came up, he had gone down a passage into the bar to settle the bill which he had incurred for the last two days. Not aware of this circumstance, Cartwright, in the bustle which prevailed, went up stairs to Mr Harvey's bedroom and parlour, in neither of which, to his surprise, did he find the occupant; and he turned away discomfited. Passing along towards the chief staircase, he perceived a room of which the door was open, and that on the table there lay a gold watch and appendages. Nobody was in the apartment: the gentleman who occupied it had only a few moments before gone to his bedchamber for a brief space. Quick as lightning a diabolical thought flashed through the brain of the villain, who had been baffled in his original intentions. He recollected that he had seen a trunk in Harvey's room, and that the keys hung in the lock. An inconceivably short space of time served for him to seize the watch, to deposit it at the bottom of Harvey's trunk, and to quit the hotel by a back stair, which led by a short cut to the harbour. The whole transaction was done unperceived, and the wretch at least departed unnoticed.

Having finished his business at the bar, Mr Harvey repaired to his room, locked his trunk, which, being of a small and handy size, he mounted on his shoulder, and proceeded to leave the house by the back stair, in order to get as quickly as possible to the vessel. Little recked he of the interruption which was to be presented to his departure. He had got as far as the foot of the stair with his burden, when he was overtaken by a waiter, who declared that he was going to leave the house clandestinely without settling accounts. It is proper to mention that Mr Harvey had incurred the enmity of this particular waiter in consequence of having, out of his slender resources, given him too small a gratuity on the occasion of paying a former bill, and not aware of the second bill being settled, the waiter was rather glad to have an opportunity of charging him with a fraudulent design. In vain Mr Harvey remonstrated, saying he had paid for everything. The waiter would not believe his statement, and detained him 'till he should hear better about it.'

'Let me go, fellow; I insist upon it,' said Mr Harvey, burning with indignation. 'I am already too late.'

'Not a step, till I ask master if accounts are squared.'

At this moment, while the altercation was at the hottest, a terrible ringing of bells was heard, and above stairs was a loud noise of voices, and of feet running to and fro. A chambermaid came hurriedly down the stair, exclaiming that some one had stolen a gold watch from No. 17, and that nobody ought to leave the house till it was found. The landlord also, moved by the hurricane which had been raised, made his appearance at the spot where Harvey was interrupted in his exit.

'What on earth is all this noise about, John?' inquired the landlord of the waiter.

'Why, sir, I thought it rather strange for any gentleman to leave the house by the back way, carrying his own portmanteau, and so I was making a little breeze about it, fearing he had not paid his bill, when all of a sudden Sally rushes down the stair and says as how No. 17 has missed his gold watch, and that no one should quit the hotel.'

No. 17, an old, dry-looking military gentleman, in

a particularly high passion, now showed himself on the scene, uttering terrible threats of legal proceedings against the house for the loss he had sustained.

Harvey was stupefied and indignant, yet he could hardly help smiling at the pother. 'What,' said he, 'have I to do with all this? I have paid for everything; I am surely entitled to go away if I like. Remember, that if I lose my passage to Boston, you shall answer for it.'

'I very much regret detaining you, sir,' replied the keeper of the hotel; 'but you hear there has been a robbery committed within the last few minutes, and as it will be proper to search every one in the house, surely you, who are on the point of departure, will have no objections to be searched first, and then be at liberty to go?'

There was something so perfectly reasonable in all this, that Harvey stepped into an adjoining parlour, and threw open his trunk for inspection, never doubting that his innocence would be immediately manifest.

The waiter, whose mean rapacity had been the cause of the detention, acted as examiner. He pulled one article after another out of the trunk, and at length—horror of horrors!—held up the missing watch with a look of triumph and scorn!

'Who put that there?' cried Harvey in an agony of mind which can be better imagined than described. 'Who has done me this grievous wrong? I know nothing as to how the watch came into my trunk.'

No one answered this appeal. All present stood for a moment in gloomy silence.

'Sir,' said the landlord to Harvey on recovering from his surprise, 'I am sorry for you. For the sake of a miserable trifle, you have brought ruin and disgrace on yourself. This is a matter which concerns the honour of my house, and cannot stop here. However much it is against my feelings, you must go before a magistrate.'

'By all means,' added No. 17, with the importance of an injured man. 'A pretty thing that one's watch is not safe in a house like this!'

'John, send Boots for a constable,' said the landlord.

Harvey sat with his head leaning on his hand. A deadly cold perspiration trickled down his brow. His heart swelled and beat as if it would burst. What should he do? His whole prospects were in an instant blighted. 'Oh God! do not desert a frail and unhappy being: give me strength to face this new and terrible misfortune,' was a prayer he internally uttered. A little revived, he started to his feet, and addressing himself to the landlord, he said, 'Take me to a magistrate instantly, and let us have this diabolical plot unravelled. I court inquiry into my character and conduct.'

'It is no use saying any more about it,' answered the landlord; 'here is Boots with a constable, and let us all go away together to the nearest magistrate. Boots, carry that trunk. John and Sally, you can follow us.'

And so the party, trunk and all, under the constable as conductor, adjourned to the house of a magistrate in an adjacent street. There the matter seemed so clear a case of felony—robbery in a dwelling-house—that Harvey, all protestations to the contrary, was fully committed for trial at the ensuing March assizes, then but a few days distant.

At the period at which these incidents occurred, I was a young man going on my first circuits. I had not as yet been honoured with perhaps more than three or four briefs, and these only in cases so slightly productive of fees, that I was compelled to study economy in my excursions. Instead of taking up my residence at an inn when visiting —, a considerable seaport, where the court held its sittings, I dwelt in lodgings kept by a widow lady, where, at a small expense, I could enjoy perfect quietness, free from interruption.

On the evening after my arrival on the March cir-

cuit of the year 17—, I was sitting in my lodgings perusing a new work on criminal jurisprudence, when the landlady, after tapping at the door, entered my room.

'I am sorry to trouble you, sir,' said she; 'but a lady has called to see you about a very distressing law case—very distressing indeed, and a very strange case it is too. Only, if you could be so good as see her?'

'Who is she?'

'All I know about it is this: she is a Mrs Harvey. She and her husband and children were to sail yesterday for Boston. All were on board except the husband; and he, on leaving the large hotel over the way, was taken up for a robbery. Word was in the evening sent by the prisoner to his wife to come on shore with all her children and the luggage; and so she came back in the pilot boat, and was in such a state of distress, that my brother, who is on the preventive service, and saw her land, took pity on her, and had her and her children and things taken to a lodging on the quay. As my brother knows that we have a London lawyer staying here, he has advised the poor woman to come and consult you about the case.'

'Well, I'll see what can be done. Please desire the lady to step in.'

A lady was shortly shown in. She had been pretty, and was so still, but anxiety was pictured in her pale countenance. Her dress was plain, but not inelegant; and altogether she had a neat and engaging appearance.

'Be so good as sit down,' said I, bowing; 'and tell me all you would like to say.'

The poor woman burst into tears; but afterwards recovering herself, she told me pretty nearly the whole of her history and that of her husband.

Lawyers have occasion to see so much duplicity, that I did not all at once give assent to the idea of Harvey being innocent of the crime of which he stood charged.

'There is something perfectly inexplicable in the case,' I observed, 'and it would require sifting. Your husband, I hope, has always borne a good character?'

'Perfectly so. He was no doubt unfortunate in business; but he got his certificate on the first examination; and there are many who would testify to his uprightness.' And here again my client broke into tears, as if overwhelmed with her recollections and prospects.

'I think I recollect Mr Harvey's shop,' said I soothingly. 'It seemed a very respectable concern; and we must see what can be done. Keep up your spirits; the only fear I have arises from the fact of Judge A— being on the bench. He is usually considered severe, and if exculpatory evidence fail, your husband may run the risk of being—transported.' A word of more terrific import, with which I was about to conclude, stuck unuttered in my throat. 'Have you employed an attorney?' I added.

'No; I have done nothing as yet, but apply to you, to beg of you to be my husband's counsel.'

'Well, that must be looked to. I shall speak to a local agent, to prepare and work out the case; and we shall all do our utmost to get an acquittal. To-morrow I will call on your husband in prison.'

Many thanks were offered by the unfortunate lady, and she withdrew.

I am not going to inflict on the reader a detailed account of this remarkable trial, which turned, as barristers would say, on a beautiful point of circumstantial evidence. Along with the attorney, a sharp enough person in his way, I examined various parties at the hotel, and made myself acquainted with the nature of the premises. The more we investigated, however, the more dark and mysterious—always supposing Harvey's innocence—did the whole case appear. There was not one redeeming trait in the affair, except Harvey's previous good character; and good character, by the law of England, goes for nothing in opposition to facts

proved to the satisfaction of a jury. It was likewise most unfortunate that A—— was to be the presiding judge. This man possessed great forensic acquirements, and was of spotless private character; but, like the majority of lawyers of that day—when it was no extraordinary thing to hang twenty men in a morning at Newgate—he was a stanch stickler for the gallows as the only effectual reformer and safeguard of the social state. At this time he was but partially recovered from a long and severe indisposition, and the traces of recent suffering were distinctly apparent on his pale and passionless features.

Harvey was arraigned in due form; the evidence was gone carefully through; and everything, so far as I was concerned, was done that man could do. But at the time to which I refer, counsel was not allowed to address the court on behalf of the prisoner—a practice since introduced from Scotland—and consequently I was allowed no opportunity to draw the attention of the jury to the total want of any direct evidence of the prisoner's guilt. Harvey himself tried to point out the unlikelihood of his being guilty; but he was not a man gifted with dialectic qualities, and his harangue fell pointless on the understandings of the twelve commonplace individuals who sat in the jury-box. The judge finally proceeded to sum the evidence, and this he did emphatically *against* the prisoner—dwelling with much force on the suspicious circumstance of a needy man taking up his abode at an expensive fashionable hotel; his furtive descent from his apartments by the back stairs; the undoubted fact of the watch being found in his trunk; the improbability of any one putting it there but himself; and the extreme likelihood that the robbery was effected in a few moments of time by the culprit, just as he passed from the bar of the hotel to the room which he had occupied. 'If,' said he to the jury, in concluding his address, 'you can, after all these circumstances, believe the prisoner to be innocent of the crime laid to his charge, it is more than I can do. The thing seems to me as clear as the sun at noonday. The evidence, in short, is irresistible; and if the just and necessary provisions of the law are not enforced in such very plain cases, then society will be dissolved, and security for property there will be none. Gentlemen, retire and make up your verdict.'

The jury were not disposed to retire. After communing a few minutes together, one of them stood up and delivered the verdict: it was *GUILTY!* The judge assumed the crowning badge of the judicial potentate—the black cap; and the clerk of arraigns asked the prisoner at the bar, in the usual form, if he had anything to urge why sentence of death should not be passed upon him.

Poor Harvey! I durst scarcely look at him. As the sonorous words fell on his ear, he was grasping nervously with shaking hands at the front of the dock. He appeared stunned, bewildered, as a man but half awakened from a hideous dream might be supposed to look. He had comprehended, though he had scarcely heard, the verdict; for on the instant, the voice which but a few years before sang to him by the brook side, was ringing through his brain, and he could recognise the little pattering feet of his children, as, sobbing and clinging to their shrieking mother's dress, she and they were hurried out of court. The clerk, after a painful pause, repeated the solemn formula. By a strong effort the doomed man mastered his agitation; his pale countenance lighted up with indignant fire, and firm and self-possessed, he thus replied to the fearful interrogatory:—

'Much could I say in the name, not of mercy, but of justice, why the sentence about to be passed on me should not be pronounced; but nothing, alas! that will avail me with you, pride-blinded ministers of death. You fashion to yourselves—out of your own vain conceits do you fashion—modes and instruments, by the aid of which you fondly imagine to invest yourselves with attributes which belong only to Omniscience; and

now I warn you—and it is a voice from the tomb, in whose shadow I already stand, which addresses you—that you are about to commit a most cruel and deliberate murder.'

He paused, and the jury looked into each other's eyes for the courage they could not find in their own hearts. The voice of conscience spoke, but was only for a few moments audible. The suggestions that what grave parliaments, learned judges, and all classes of 'respectability' sanctioned, could not be wrong, much less murderous or cruel, silenced the 'still, small' tones, and tranquillised the startled jurors.

'Prisoner at the bar,' said the judge with his cold, calm voice of destiny, 'I cannot listen to such observations: you have been found guilty of a heinous offence by a jury of your countrymen after a patient trial. With that finding I need scarcely say I entirely agree. I am as satisfied of your guilt as if I had seen you commit the act with my own bodily eyes. The circumstance of your being a person who, from habits and education, should have been above committing so base a crime, only aggravates your guilt. However, no matter who or what you have been, you must expiate your offence on the scaffold. The law has very properly, for the safety of society, decreed the punishment of death for such crimes: our only and plain duty is to execute that law.'

The prisoner did not reply: he was leaning with his elbows on the front of the dock, his bowed face covered with his outspread hands; and the judge passed sentence of death in the accustomed form. The court then rose, and a turnkey placed his hand upon the prisoner's arm, to lead him away. Suddenly he uncovered his face, drew himself up to his full height—he was a remarkably tall man—and glared fiercely round upon the audience, like a wild animal at bay. 'My lord,' he cried, or rather shouted, in an excited voice. The judge motioned impatiently to the jailor, and strong hands impelled the prisoner from the front of the dock. Bursting from them, he again sprang forward, and his arms outstretched, whilst his glittering eye seemed to hold the judge spell-bound, exclaimed, 'My lord, before another month has passed away, you will appear at the bar of another world, to answer for the life, the innocent life, which God bestowed upon me, but which you have impiously cast away as a thing of naught and scorn!' He ceased, and was at once borne off. The court, in some confusion, hastily departed. It was thought at the time that the judge's evidently failing health had suggested the prophecy to the prisoner. It only excited a few days' wonder, and was forgotten.

The position of a barrister in such circumstances is always painful. I need hardly say that my own feelings were of a very distressing kind. Conscious that if the unfortunate man really was guilty, he was at least not deserving of capital punishment, I exerted myself to procure a reprieve. In the first place I waited privately on the judge; but he would listen to no proposal for a respite. Along with a number of individuals—chiefly of the Society of Friends—I petitioned the crown for a commutation of the sentence. But being unaccompanied with a recommendation from the judge, the prayer of our petition was of course disregarded: the law, it was said, must take its course. How much cruelty has been exercised under shelter of that remorseless expression!

I would willingly pass over the succeeding events. Unable to save his life, I endeavoured to soothe the few remaining hours of the doomed convict, and frequently visited him in the condemned cell. The more I saw of him, the deeper grew my sympathy in his case, which was that of no vulgar felon. 'I have been a most unfortunate man,' said he one day to me. 'A destiny towards ruin in fortune and in life has pursued me. I feel as if deserted by God and man; yet I know, or at least would persuade myself, that Heaven will one day vindicate my innocence of this foul charge. To think of being hanged like a dog for a crime at which my

soul revolts! Great is the crime of those imbecile jurors and that false and hard-hearted judge, who thus, by an irreversible decree, consign a fellow-mortal to a death of violence and disgrace. Oh God, help me—help me to sustain that bitter, bitter hour! And then the poor man would throw himself on his bed and weep.

But the parting with his wife and children. What pen can describe that terrible interview! They knelt in prayer, their wo-begone countenances suffused in tears, and with hands clasped convulsively together. The scene was too harrowing and sacred for the eye of a stranger. I rushed from the cell, and buried myself in my lodgings, whence I did not remove till all was over. Next day James Harvey, a victim of circumstantial evidence, and of a barbarous criminal code, perished on the scaffold.

Three weeks afterwards, the court arrived at a populous city in the west of England. It had in the interval visited another assize town, and there Judge A—— had left three for execution. At the trials of these men, however, I had not attended. So shocked had been my feelings with the mournful event which had taken place at——, that I had gone into Wales for the sake of change of scene. After roaming about for a fortnight amidst the wild solitudes of Caernarvonshire, I took the stage for the city which I knew the court was to visit, and arrived on the day previous to the opening of the assizes.

'Well, are we to have a heavy calendar?' I inquired next morning of a brother barrister on entering the court.

'Rather light for a March assize,' replied the impatient counsel as he bustled onward. 'There's Cartwright's case—highway robbery—in which I am for the prosecution. He'll swing for it, and perhaps four or five others.'

'A good hanging judge is A——,' said the undersheriff, who at this moment joined us, rubbing his hands, as if pleased with the prospect of a few executions. 'No chance of the prophecy yonder coming to pass I suppose?'

'Not in the least,' replied the bustling counsel. 'He never looked better. His illness has gone completely off. And this day's work will brighten him up.'

Cartwright's trial came on. I had never seen the man before, and was not aware that this was the same person whom Harvey had incidentally told me he had discharged for theft; the truth being, that till the last moment of his existence, that unfortunate man had not known how much he had been a sacrifice to this wretch's malice.

The crime of which the villain now stood accused was that of robbing a farmer of the paltry sum of eight shillings, in the neighbourhood of Ilfracombe. He pleaded not guilty, but put in no defence. A verdict was recorded against him, and in due form A—— sentenced him to be hanged. An expression of fiendish malignancy gleamed over the haggard features of the felon as he asked leave to address a few words to the court. It was granted. Leaning forward, and raising his heavy scowling eyes to the judge, he thus began:—'There is something on my mind, my lord—a dreadful crime—which, as I am to die for the eight shillings I took from the farmer, I may as well confess. You may remember Harvey, my lord, whom you hanged the other day at——?'

'What of him, fellow?' replied the judge, his features suddenly flushing crimson.

'Why, my lord, only this—that he was as innocent of the crime for which you hanged him as the child yet unborn! I did the deed! I put the watch in his trunk!' And to the unutterable horror of the entire court, he related the whole particulars of the transaction, the origin of his grudge against Harvey, and his delight on bringing him to the gallows.

'Inhuman, execrable villain!' gasped the judge in extreme excitement.

'Cleverly done, though! Was it not, my lord?' rejoined the ruffian with bitter irony. 'The evidence, you know, was irresistible; the crime as clear as the sun at noonday; and if, in such plain cases, the just and necessary law was not enforced, society would be dissolved, and there would be no security for property! These were your words, I think. How on that occasion I admired your lordship's judgment and eloquence! Society would be dissolved if an innocent man were not hanged! Ha!—ha!—ha! Capital!—capital!' shouted the ferocious felon with demoniac glee, as he marked the effect of his words on the countenance of the judge.

'Remove the prisoner!' cried the sheriff. An officer was about to do so; but the judge motioned him to desist. His lordship's features worked convulsively. He seemed striving to speak, but the words would not come.

'I suppose, my lord,' continued Cartwright in low and hissing tones, as the shadow of unutterable despair grew and settled on his face—'I suppose you know that his wife destroyed herself. The coroner's jury said she had fallen accidentally into the water. I know better. She drowned herself under the agonies of a broken heart! I saw her corpse, with the dead baby in its arms; and then I felt, knew, that I was lost! Lost, doomed to everlasting perdition! But, my lord'—and here the wretch broke into a howl wild and terrific—'we shall go down together—down to where your deserts are known. A—h—h! that pinches you, does it? Hound of a judge! legal murderer! coward! I spurn and spit upon thee!' The rest of the appalling objur-gation was inarticulate, as the monster, foaming and sputtering, was dragged by an officer from the dock.

Judge A—— had fallen forwards on his face, fainting and speechless with the violence of his emotions. The black cap had dropped from his brow. His hands were stretched out across the bench, and various members of the bar rushed to his assistance. The court broke up in frightful commotion.

Two days afterwards the county paper had the following announcement:—

'Died at the Royal Hotel, —, on the 27th instant, Judge A——, from an access of fever supervening upon a disorder from which he had imperfectly recovered.'

The prophecy was fulfilled!

AUSTRALIAN BIRDS.

Among the contributions to natural science which tend to enlarge its boundaries and increase its utility, Mr Gould's 'Birds of Australia' must long hold a prominent place. This valuable work, which for several years has made its appearance in quarterly parts, is now complete; and to the lover of natural history, few pleasures can be greater than turning over its leaves, where, with few exceptions, are represented, of the natural size, and in all their gorgeous colours, the feathered inhabitants of our Australian dominions. These interesting countries, already remarkable for phenomena the very opposite of our European experiences—rivers, for example, which do not discharge themselves into the sea, and quadrupeds with a bill—are not less noteworthy as regards the birds which inhabit their boundless plains and tangled forests.

Mr Gould in his descriptions omits no opportunity of recommending the naturalisation in this country of such birds as are likely to survive the change of climate; and among the resources open to wealth, we think this of adding to the stock of living things which may please the eye or charm the ear not the least. The *Gymnorhina tibicen*, or piping crow-shrike, is instanced as one that may be easily domesticated and removed. With its blue bill, bright eye, and white and black markings, it would be an interesting acquisition. 'To describe the notes of this bird,' says Mr Gould, 'is beyond the power of my pen; and it is a source of regret to myself that my readers cannot, as I have done, listen to them in their

native wilds, or that the bird is not introduced into this country in sufficient numbers for it to become generally known: a more amusing and easily-kept denizen for the aviary could not be found.' Another crow-shrike, the *Gymnorhina organica*, has one kind of note when hopping on the ground, and one altogether different when perched on a tree—a position which it generally takes soon after daybreak. It then utters tone after tone similar to a hand-organ out of tune, which has led to its being named Organ-bird by the settlers. A third, the Hill crow-shrike, has so metallic a voice as to resemble the clink of hammers on an anvil heard at a distance. The *Geopelia cuneata*, a species of dove, instead of cooing as doves in this country, gives utterance to a note said to sound like the distant crowing of a cock. Then we have one, the shining fly-catcher, which, while creeping about in search of food in the dense thickets, croaks like a frog, but when on the upper branches of trees, pours forth a cheerful note; on being disturbed, it immediately drops, and resumes the croak. The brown fly-catcher has a morning, noon, and even song: early in the day it sits warbling and chirping; at noon it soars upwards, as the lark, till nearly or quite invisible, singing melodiously during the ascent and descent; in the evening it perches, and again warbles and chirps, in tones, however, different from those of the morning. These birds are so pugnacious, that although not larger than a linnet, two of them attacked and drove away a crow, which was probably considered as an intruder upon their domains. The traveller, in his wanderings, occasionally hears an inward sound resembling the drone of a bagpipe, or purring of a cat; this is produced by birds. The *Ptilonorhynchus viridis*, or cat-bird, while devouring the fruits which constitute its food, squalls in an extraordinary, but not unfamiliar style. 'In comparing it,' observes Mr Gould, 'to the nightly concerts of the domestic cat, I conceive that I am conveying a more perfect idea of the note of this species than could be given by pages of description. This concert, like that of the animal whose name it bears, is performed either by a pair or several individuals; and nothing more is required than for the hearer to shut his eyes from the neighbouring foliage, to fancy himself surrounded by London grimalkins of house-top celebrity.' The musk duck, an almost solitary animal, utters a singular note, 'resembling the sound caused by a large drop of water falling into a deep well.' The author could never force this bird to fly; when disturbed, it invariably dived, and remained under water a long time, only rising for a hasty breath, until all danger was over.

For a dweller in the northern regions it is difficult to imagine the brilliant atmosphere and delicious climate of the southern tropic; and when, as in Australia, the forests are tenanted by birds of the most splendid plumage, the effect, particularly to a stranger, is greatly heightened. Multitudes of paroquets, or parakeets, of singularly beautiful appearance, flit among the branches; some of the pigeons, especially the *Ptilinopus superbus*, are gorgeously coloured. At times, too, the traveller may see a thousand magnificent white cockatoos sporting in the dark foliage over his head, and screeching with a vivacity almost deafening. Not unfrequently he will fancy himself to be near to a sheep-run, as he will hear the tinkle-tinkle of the animals' bells. This sound, however, is produced by the elegant bell-bird, whose colours—brown, olive, and yellow—render it a prominent object. It continues this strange note for a long time without intermission; and so much does it resemble a sheep-bell, as often to deceive shepherds. When a hundred or more are tinkling all at once, the effect is most singular. The *Dacelo gigantea*, or great brown kingfisher, is another Australian marvel. 'In its disposition it is by no means shy; and when any new objects are presented to its notice, such as a party traversing the bush, or pitching their tent in the vicinity of its retreat, it becomes very prying and inquisitive, often perching on the dead branch of some neighbouring tree, and watching with the greatest curiosity the kindling of the fire and the preparation of the meal: its presence,

however, owing to the quietude with which it passes through the forest, and the almost noiseless manner in which it settles, is seldom detected until it emits its extraordinary gurgling, laughing note, which generally calls forth some exclamation according to the temper of the hearer, such as—"There is our old friend the laughing jackass," or an epithet of a less friendly character. Not unfrequently does its life pay the penalty of its temerity; for if, as is often the case, the traveller's larder be ill-provided, and his appetite keen, but a few minutes elapse before it is roasting over the fire it was lately surveying with so much curiosity.' The gurgling laugh of this bird may be heard at the beginning, middle, and end of the day; some travellers compare it to a mocking voice, or chorus of wild spirits.

Most persons would doubtless prefer a stroll through English woods to one in an Australian forest with its extraordinary assemblage of sounds: it is fortunate that some of the birds are endowed with such melodious powers as to compensate for the cacophony of the others, of which one or two yet remain to be noticed. The *Phosphodes crepitans*, coach-whip-bird, utters a full ringing note, terminated abruptly, as by a sharp smack of a whip. The voice of the brush wattle-bird resembles that of a person retching or vomiting, which sounds have led the natives to give it the name *Goo-gwar-ruck*. Besides these, there is a ventriloquist, the crested oreoica; to the hunter, the strain of this bird sometimes sounds very remote, while the creature at the time is seated on a branch but a few feet above his head. Presently the note is close by; and thus it goes on, now near, now distant, throwing in at times a stroke of a bell.

The habits of many Australian birds are not less remarkable than their voices. The forests abound in mosses which enwrap the trunk, and droop from the ends of the branches in masses resembling narrow bags or purses a yard or more in length; sometimes so low as to touch the head of the traveller passing underneath. The yellow-throated sericornis makes choice of one of these dependent clusters for a residence; and 'although,' as Mr Gould observes, 'the nest is constantly disturbed by the wind, and liable to be shaken when the tree moves, so secure does the inmate consider herself from danger or intrusion of any kind, that I have frequently captured the female while sitting on her eggs, a feat that may always be accomplished by carefully placing the hand over the entrance—that is, if it can be detected, to effect which, no slight degree of close prying and examination is necessary.' Some of these nests, not to be reached by climbing, were obtained by Mr Gould by shooting in two the branch to which they are attached. Considerable ingenuity is exhibited by the black-capped sitella, which makes its nest of pieces of bark, fastened to a branch by cobwebs; this substance, however, is not merely twisted round, but 'felted on.' When placed in the fork of a tree, the nest so closely resembles an excrescence of the bark, as to defy, and often escape detection. Some of the robins also construct their nests in the same manner. The striated reed-lark builds a dome-shaped nest on the ground, but most artfully concealed by the surrounding grass; and for further security, it forms a passage or burrow two or three feet in length, by which it is approached.

In this country we generally find that during incubation the male bird sits on a branch near the nest, attendant on its mate, but in Australia the same arrangement is carried out with an attempt at greater ease or comfort. The yellow-tailed acanthiza, which frequents its carelessly-built nest for several years in succession, often constructs 'a small cup-shaped depression, or second nest, as it were, on the top or side of the other, and which is said to be either the roosting-place of the male, or where he may sit in order to be in company with the female during the task of incubation.' The white-headed osprey, which always builds near water, on a rock, or at the top of a tall tree, makes a nest fifteen feet in diameter, of sticks, some of which are as thick as a man's arm; the interior is lined with seaweed. The whistling eagle's nest is of the same description; and, singularly

enough, the spotted-sided finch, *Amadina Lathamii*, chooses the rough sticks forming its base as a site for its own habitation. Mr Gould took one of these nests with eggs while the eagle was sitting only a few inches above.

The districts frequented by particular birds are sometimes as clearly definable as the boundaries of a country. In Australia, the fairy martin appears never to be found within twenty miles of the coast. This favourite little bird generally selects steep river banks as a secure place for its domicile. The nest is in the shape of a bottle gourd, nine or ten inches long; sometimes thirty or forty are built in a cluster, with the necks projecting from the bank, either horizontally or downwards. Seven or eight birds work together at a nest; one remains inside, to receive and deposit the clay brought by the others. The rock-warbler, *Origma rubricata*, appears to be of analogous habits to the bird just mentioned. It is said never to visit forests, or to alight on trees, and mostly frequents rocky clefts, gullies, and dark caverns by the water-side. The nest is of an oblong globular bottle shape, fabricated of moss and similar materials, and is suspended by its long neck to the roof of the cavern, or to overhanging pieces of rock. A lateral opening is left for an entrance near the bottom; but hitherto nothing has been ascertained with respect to the mode of suspension. Another swallow, *Dicaeum*, forms its nest, purse-like in shape, of cotton extracted from the seed-vessels of plants, and suspends it on the branches of a tall tree. The white-rumped wood-swallow takes possession of old nests abandoned by other birds, and reduces them to a proper size for itself, at the same time rendering them snugly warm by a soft thick lining. The white-shafted fantail builds a nest resembling in shape a long-stemmed footless wine-glass. In constructing this nest, the base of the cup and lower extremity of the stem are made to embrace two slender twigs of a bush, which hold it in a vertical position. One of them thus attached may be seen at the British Museum. This is an instance of care in fabrication, the more remarkable when contrasted with the want of care among other birds. The nest of the black-throated grebe, for example, is nothing more than a floating mass of weeds heaped together in a rounded form in a pond, with the top just level with the surface of the water. The pheasant cuckoo presents a singular appearance while sitting with its head and tail projecting from openings opposite each other in its dome-shaped nest, apparently left for the purpose, and probably to enable the bird to keep watch while reposing. The grass-loving spenceaeus, which attaches its nest to a few reeds about two feet above the surface of the water in which they grow, lines the structure with feathers, but places two of the largest so as to form a sort of canopy, and protect the interior from wet. The spotted pardalote (diamond-bird of the colonists) builds in a situation altogether different from all others of the genus: instead of trees or bushes, it takes to the ground, and selecting a bank, bores a hole, sloping upwards for several feet, and excavates a chamber at the inner end, in which its round nest is beautifully built of soft bark, leaving a small opening for an entrance. The outer extremity of the hole is so artfully concealed, that long watching is required in order to be able to detect it. 'How so neat a structure,' writes Mr Gould, 'as is the nest of the spotted pardalote, should be constructed at the end of a hole where no light can possibly enter, is beyond our comprehension, and is one of those wonderful results of instinct so often presented to our notice in the history of the animal creation, without our being in anyway able to account for them.'

In this portion of our glance over the birds of Australia, we find ample cause for admiration and further research. Mr Gould's book will furnish as much recreation to the occasional reader as information to the scientific inquirer. Although he was indebted for specimens to explorers who have penetrated the interior, by far the greater part is due to his own personal investigations in that interesting country.

In respect of the economy of the Australian birds, there are many circumstances equally worthy of atten-

tion. The *Mahurus cyaneus*, or blue wren, undergoes a singular transformation: in winter the plumage of both male and female is of a reddish brown; the birds are then tame and familiar, and wander about near the houses in country neighbourhoods, in little groups of six or eight. 'As spring advances, they separate into pairs, the male undergoing a total transformation not only in the colour, but also in the texture of its plumage; indeed a more astonishing change can scarcely be imagined, its plain and unassuming garb being thrown off for a few months, and another assumed, which for resplendent beauty is hardly surpassed by any of the feathered race, certainly by none but the humming-birds and cotingas of America. Nor is the change confined to the plumage alone, but extends also to its habits; in fact its whole character and nature appear to have received a new impulse; the little creature now displaying great vivacity, proudly showing off its gorgeous attire to the utmost advantage, and pouring out its animated song unceasingly, until the female has completed her task of incubation, and the craving appetites of its newly-hatched young call forth a new feeling, and give its energies a new direction.' The colours of this beautiful livery, which is put on in March, and left off in August, are a most brilliant blue on a velvety black, tipped with a few pencillings of white. Some of the birds are so curiously marked, as to have received names from the settlers expressive of the peculiarity. The *Eurystomus Australis* is called the dollar-bird, from a round white spot seen in each of its wings while flying. A black mark, resembling a V, in the extended wing of the *Elanus scriptus*, has produced for it the appellation of Letter-winged Kite: when both wings are spread, the appearance is that of a W.

The name of emu wren is given to the *Stipiturus malachurus* from its loose, lightly-formed, spreading tail of six feathers, an appendage which the bird has the power of bending forwards until it lies horizontally on its back. The whole tribe of wrens is described as of marvellous capabilities for escaping from danger by a mode which is not hopping, flying, or running, but a combination of all three. The textile wren, however, is the most extraordinary—'Indeed its mode of progression on the ground is such as no description can convey an accurate conception of, and must be seen to be understood. I cannot compare it,' says Mr Gould, 'with anything, unless perhaps with the motion of an India-rubber ball when thrown forcibly along the ground. While stealing from bush to bush with this rapid movement, it presents an exceedingly droll appearance.' The diving petrel, a bird that frequents the coasts, presents another instance of rapidity of movement. Its powers of flight are weaker than those of others of the same species, but this is compensated for by swiftness. It does not fly in steady progression, but with a short quick flutter, so near the surface of the sea, that it prefers to dash through the waves rather than rise over them. Such is its celerity, as to have given rise to the belief that it flies even while under the water. In striking contrast to these agile birds is the tawny-shouldered podargus, which sits in pairs all day on a branch, wrapped in a lethargic sleep. So profound is the repose, or such the unwillingness of the bird to move, that one has been shot off the branch without disturbing the other.

The varieties of honey-eaters are among the most interesting of Australian birds; in habits and appearance they are peculiarly pleasing. The wattled honey-eater, *Anthochaera inauris*, is decorated with a splendid golden drop hanging from each ear. The eucalypti, a species of tree abundant in Australia, are the favourite resort of these birds; their flowers are said to be renewed 'with every rising sun throughout the year.' A wise provision of nature is apparent in the tongue of most of the honey-eaters: the tip of that useful member is finished as a brush, which enables them readily to extract the juices from the calices of flowers. Some of these birds become exceedingly fat in winter, and are then sold in the markets at Hobart Town in enormous quantities. Others

gorge themselves to such an extent with honey, that on holding them head downwards when shot, a spoonful of the luscious fluid will flow from their mouths. Another instance of a curious tongue occurs in the Philip-Island parrot: it resembles the end of a finger, with the nail on the under side, forming a kind of spoon. This bird is further distinguished by barking like a dog.

The bronze cuckoo of Australia offers an interesting puzzle to naturalists: it deposits its egg in the nest of the blue wren. This structure is dome-shaped, with a small hole only at the side for entrance; and it is not easy to conceive the mode adopted by the large bird to introduce the egg by an opening so disproportioned to its size. We may add, that the interloper is hatched and reared by his diminutive foster-parents with as much care and attention as his European congener. Among the larger kind of birds, there is an interesting incident connected with the Australian crane, a noble bird, standing four feet in height. It is said to be easily tamed, and being of graceful movements, looks well walking about a garden or pleasure-grounds. Two of these cranes were once kept on the estate of a gentleman near Camden, and 'so far attracted the notice of a pair of wild birds, as to induce them to settle and feed near the house, make acquaintance with himself and the other members of his establishment, and becoming still tamer, to approach the yard, feed from his hand, and even to follow the domesticated birds into the kitchen, until unfortunately a servant imprudently seizing at one of the wild birds, and tearing a handful of feathers from its back, the wildness of its disposition was roused; and darting forth, followed by its companion, it mounted into the air, soaring higher and higher at every circle, at the same time uttering its hoarse call, which was responded to by the tame birds below. For several days did they return and perform the same evolutions without alighting, until, the dormant impulses of the tame birds being aroused, they also mounted high in the air, winged their way to some far distant part of the country, and never returned to the home where they had been so long fostered.' This awakening of aboriginal instincts has had many parallels among uncultivated specimens of humanity.

We select one more example, as peculiarly illustrative of the manifold workings of nature; in fact, while ignorant of the law to which it to be referred, we may look upon it as a freak. The *Ptilonorhynchus holosericus*, from its singular habits, has received the name of Satin Bower-bird; its nest has not yet been discovered; and as, previously to Mr Gould's visit to Australia, it had not been described, he took pains to watch the creature in its native haunts. This bird, as its name imports, constructs a bower, not for a dwelling, but as a place of recreation. Its habitat appears to be confined to the district of New South Wales, and Mr Gould first saw it in the woods at the base of the Liverpool Mountains. The bower is usually placed in a retired spot, under the shade of a tree. 'The base consists of an extensive and rather convex platform of sticks, firmly interwoven, on the centre of which the bower itself is built: this, like the platform on which it is placed, and with which it is interwoven, is formed of sticks and twigs, but of a more slender and flexible description, the tips of the twigs being so arranged as to curve inwards, and nearly meet at the top. In the interior of the bower, the materials are so placed that the forks of the twigs are always presented outwards, by which arrangement not the slightest obstruction is offered to the passage of the birds.' In this way an avenue about two feet in length is formed; either end is decorated by gaudy feathers dropped by other birds, inserted between the twigs, and by shells and bones laid in a heap, in the interstices of which feathers are also placed. 'The propensity of these birds,' pursues Mr Gould, 'to pick up and fly off with any attractive object, is so well known to the natives, that they always search the runs for any small missing article, as the bowl of a pipe, &c. that may have been accidentally dropped in the bush. I myself found at the entrance of one of them a small neatly-worked stone toma-

hawk, of an inch and a-half in length, together with some slips of blue cotton rags, which the birds had doubtless picked up at a deserted encampment of the natives.'

'For what purpose these curious bowers are made is not yet perhaps fully understood; they are certainly not used as a nest, but as a place of resort for many individuals of both sexes, which, when there assembled, run through and around the bower in a sportive and playful manner, and that so frequently, that it is seldom entirely deserted.'

The satin-bower bird is about the size of a crow; its purloinings are for decoration, not for concealment. The bowers are made use of for several years, and repaired when damaged. The most probable supposition as to their use is, that the birds use them as a rendezvous during pairing-time and the period of incubation. Two of these singular structures were brought to Europe by Mr Gould; one of them, with all its ornament of shells and feathers, may be seen at the British Museum.

Besides this, there is the spotted bower-bird: the bower of this species is a foot or more longer than the one just described; and the interior is formed of tall grasses, which, by the curve of the outer twigs, are bent over till they meet. The bottom of the bower is paved with stones, which keep the lower extremities of the grass at a proper degree of divergence. There is the same accumulation of ornament as in the former case, half a bushel of shells being not unfrequently found at either end of the avenue or run. The whitest and most glittering are always chosen, and being collected from long distances, must cost the bird considerable labour.

The range of this bird extends far into the interior of the country. A third variety, of similar habits, has been discovered on the north-west coast, a region which as yet has been but little visited.

Our selections comprise but a very small part of the feathered races of Australia; the study of the numerous varieties which the country produces would afford a subject of inexhaustible interest. What a delightful resource for the emigrant in the back settlements, remote from society, and with but few books at command! With the birds of Australia around him, he need never fall into the vices or degradation of idleness.

WORK AND PAY.

... THERE is a secret in this subject of work practically known to multitudes, which it yet so happens is seldom embodied in written or spoken counsel. The hardest work is not the most slavish or disheartening, and he who effects most has often the greatest share of leisure. To illustrate this from the extremes of the industrial scale, let us take the leading counsel, or the accomplished railway engineer, both of whom are working with their brains almost to the utmost point which the human intellect is capable of reaching. Yet they both have their luxuries and their leisure hours. You meet them in society chatting, laughing—looking as if they had nothing to do; in the touring season you encounter them in the Highlands, on the Rhine, and yet all the world is wondering how they get through their hard work. Look now at the hand-loom weaver—pale, emaciated, half-fed, half-clad—as solemn and melancholy under the weight of unvarying physical affliction as if he had taken a monastic vow, and given away all the joys of this world for an ample reimbursement in futurity. That man knows no rest but the hours of sleep and the seventh day; every little period he takes from the weary monotony of his work is a bit of bread less to him and his children: the demon Hunger has possession of him, and drives him on till he drops at the loom. Yet that man never knew what it was to work hard—and there is the secret of all his misery. He found a monotonous easy trade to his hand, and in an evil hour he yielded to its seductions. 'If weavers are wanted,' said a witness on the hand-loom inquiry, 'they may be struck into existence in a month: some branches may be done by boys and girls, and what may be done by a boy, can never reach above a boy's wages.'

Now I do not mean to maintain that the eminent lawyer and engineer work as many times harder than the hand-loom weaver as they are better paid. It is the peculiarity

of work of every kind that a small addition to the expertness makes a large addition to the remuneration, and that the higher the grade, the more marked is this difference. This arises from the numbers gradually decreasing the further they have outstripped their brethren in excellence. At the point of skill which only three or four men have reached out of so many hundreds, there will be little competition, and high pay: when there are services which only one man can do, he can name his own price. Moreover, the general labour market in its widest sense, including efforts both of mind and body, is affected by various accidents of education, training, and position, which bring to some occupations a scale of remuneration much higher than the members of others can hope by any energy to obtain. Thus it does not follow that the scale of income corresponds with the hardness of the work; but we may take it as a general rule, that high pay is not given without some service being done for it; and that the man who can, by courageous energy in setting his mind, or his hands aided by his mind, to do some useful act requiring skill, will reap a reward for his service.

In fact the great dragon to be conquered by the strugglers through this world is indolence. It is because he has yielded to it, that yonder gray-headed gentleman is a clerk in a government office, at a hundred and fifty pounds a year, instead of making a fortune like his schoolfellow the engineer. He found the employment set before him—nothing to do but to copy pages or add up columns; no exertion of thought, no risks of failure, but a secured income—and he yielded to the temptation. In his case little harm is done: he has food and clothing, and is content. But go several steps farther down. A still easier operation than writing and casting accounts has tempted eight hundred thousand men to follow a trade which less than half the number would have supplied; and no legislation or parliamentary inquiry, no private benevolence, no relief committee, no poor-law, can obviate the devastating result. . . . Nor is the small remuneration the only evil of the humblest and most overstocked occupations. Their followers are the most acutely sensitive to oscillations in the money and labour market, and ever the most liable to be deprived of their little bit of bread. Let us just cast a thought over the manner in which the industrious, careful, and energetic members of society occupy themselves when hard times come. Some of them retrench their expenditure; they must of course have still as much as will in some way support their families, or they could not do so. Others increase their exertions. 'It is but mounting a thousand additional stairs,' said Dr Arbuthnot, when his savings were swept away by the South-Sea scheme. Here and there, active-minded people are excited to new enterprises and conquests over difficulties; they lay open new fields of exertion, or work old ones with renewed energy. The additional services so called out are marvellous, and the beneficent effect of the whole operation is, that by these exertions trade revives, and prosperity is restored. It is a mistake to suppose that these pressures and oscillations arise from too much industry.

There may be too much production relatively—too many railways, too much corn, too many gingham or satin slippers; but if every person is working where his services are required, there cannot be too much industry; and it is the tendency of the exertions made by active men in times of trial, to find out the quarters in which their labours are most useful, and thus restore the equilibrium of the market. A man can seldom turn from a losing to a gaining occupation without doing a benefit, instead of an injury, to the community.

But what can that poor creature do who has been accustomed only to give his time, and some rotatory bodily motion, when the service so produced has ceased to be worth the morsel it used to bring him? He cannot reduce his expenditure and live. He cannot increase his exertions, for they are measured by time, not work, and the whole is already taken. He is nearest the edge, and when the blast comes across the great platform of industry, he is blown over the side into the slough of mendicancy, whence he rises no more.—From an excellent series of letters in the *Daily News*, June 1848. [A principle of very great consequence to the humbler classes is here developed. It is not alone necessary to be at labour for many hours; that may be such a labour as not to deserve good remuneration. It is not all-sufficient that a small trader sticks for the whole day to his shop, for it may be a shop not required in the place, or conducted on too small a scale to be profitable.

Ingenuity, skill, judgment to make a good choice of a calling, and to improve circumstances, are also requisite. A man should see that his work is really useful, and that his shop is not superfluous.]

SWEET LAVENDER.

Lavender is the emblem of 'distant music' in the language of flowers.

'Tis the sound of distant music, and it comes from o'er the hills,
Sweeping upon the breezy air by fields and summer rills;
Up, up the valley—homesteads fair and sheltering nooks are passed;
'Oh, Lavender—sweet Lavender!' is clearly heard at last.

And forth she comes, the cottage girl, with basket on her arm,
Singing loud that summer word, whose name breathes many a charm:

'Twelve bunches for a single groat,' she adds with plaintive cry:
'Oh, Lavender—sweet Lavender!'—these treasures who will buy?

The village girls will seek the sweets—the faint perfume they prize;
By hoarded treasures, tokens dear, the annual gift-flower lies;
And mourners seek its pensive hue—it suits well with the dead—
To strew above that breathless form, now slumbering on the bed.

Oh bear it to the lone churchyard, and find a nameless mound—
There, drooping mourner, cast these sweets upon the grassy ground;
And as the sound steals on the breeze, across the quiet vale,
That well-known music soothes thy heart, attuned to sorrow's tale.

Perfume the air above the dead, the faithful, happy dead!
Comfort and hope, sweet lavender, with healing influence shed;
This angel-music floateth past—on seraph's wings 'tis borne—
The mourner's heart can hear it oft, though tempest-swayed and torn.

C. A. M. W.

HURRY AND HASTE.

'Never do anything in a hurry,' is the advice given to attorneys and solicitors by Mr Warren. 'No one in a hurry can possibly have his wits about him; and remember, that in the law there is ever an opponent watching to find you off your guard. You may occasionally be in haste, but you need never be in a hurry; take care—resolve—never to be so. Remember always that others' interests are occupying your attention, and suffer by your inadvertence—by that negligence which generally occasions hurry. A man of first-rate business talents—one who always looks so calm and tranquil, that it makes one's-self feel cool on a hot summer's day to look at him—once told me that he had never been in a hurry but once, and that was for an entire fortnight, at the commencement of his career. It nearly killed him; he spoiled everything he touched; he was always breathless, and harassed, and miserable; but it did him good for life: he resolved never again to be in a hurry—and never was, no, not once, that he could remember, during twenty-five years' practice! Observe, I speak of being hurried and flustered—not of being in haste, for that is often inevitable; but then is always seen the superiority and inferiority of different men. You may indeed almost define hurry as the condition to which an inferior man is reduced by haste. I one day observed, in a committee of the House of Commons, sitting on a railway bill, the chief secretary of the company, during several hours, while great interests were in jeopardy, preserve a truly admirable coolness, tranquillity, and temper, conferring on him immense advantages. His suggestions to counsel were masterly, and exquisitely well-timed; and by the close of the day he had triumphed. "How is it that one never sees you in a hurry?" said I, as we were pacing the long corridor, on our way from the committee-room. "Because it's so expensive," he replied with a significant smile. I shall never forget that observation, and don't you."—Warren on *Attorneys and Solicitors*.

DUTIES AND EVENTS.

Duties are ours: events are God's. This removes an infinite burden from the shoulders of the miserable, tempted, dying creature. On this consideration only can he securely lay down his head and close his eyes.—*Cecil*.

GIPSY SORCERIES IN THE DECCAN.

From their first appearance in Europe, about the middle of the fifteenth century, to the present day, the gipsies have been objects of wonder, curiosity, or interest, from the mystery in which their origin is enveloped, and from the singular manner in which they have kept apart from the nations amongst whom they wander. They were originally believed to be Egyptians, but the researches of late years establish the probability, if not the certainty, of India being their mother country. Their language is found to have no affinity with the Coptic; but it bears a strong resemblance to that of Hindoostan; and their arrival in Christendom followed at no great interval of time the period when Timour ravaged and desolated the East, practising cruelties on the wretched natives of India, which might have very probably induced them to emigrate in vast numbers.

Whether this latter supposition be correct or not, it is difficult to determine; it is, however, a fact that the gipsies exist as a distinct and numerous caste in Asia; and during a recent visit to the Deccan, I chanced to have an opportunity of seeing a large tribe of these singular outcasts, who came down from the mountains to pay a rude homage to the governor, by exhibiting before him the magic arts which, from far-off ages, have been the heritage of their race.

For this purpose they were assembled outside the governor's bungalow at Dahpooree, in a large open space, bounded on one side by the broad stream running through the garden in which the residence is built, and on the other by a hedge of giant jessamine, the post of a Hindoo sentinel. The whole population of the neighbouring little village was assembled, and covered every part of the ground, sitting, after their own strange fashion, on their heels, and all gaping with intense eagerness on the space left near the veranda for the performances of their admired sorceries. Of the simple faith with which they were prepared to witness the spectacle, we had no doubt, both from the expression of their countenances and our knowledge of their extreme superstition; for near our seats stood a young Hindoo mother, carrying an infant whose tiny ankles were tied up in rags, to preserve it from the effects of the 'evil eye,' which is peculiarly baneful when *blue*—and we had unhappily admired the little creature on the previous day.

It was about three in the afternoon, and the sun, still glorious in the cloudless, glowing sky, poured a flood of light upon the whole scene, which was highly picturesque. In a few seconds the circle by the veranda was occupied by an aged wizard, and an assistant beating a tom-tom, or drum. He placed a small pan of lighted charcoal on one side, and cast into it a few

grains of incense, muttering at the same time an incantation. A wicker basket, of about the size used to hold a baby's wardrobe, was then brought forward, and our gipsy informed us that it was his intention to put a *baba* (youth) into it; afterwards to change him into a pigeon or dove, and make him fly off whithersoever we chose. The trick did not promise to be very difficult; but we thought differently when we saw the candidate for the metamorphosis. He was a tall, fine-looking lad of sixteen or seventeen, apparently much too big to occupy the space assigned him; but the wizard approaching, threw him on the ground, tied his feet to his hands, and literally doubling him together, dropped him into a sort of cabbage-net, which he fastened over his head. He then brought him round for us to examine the strange prison; and certainly it appeared a clear case of 'I can't get out.' He was consigned to the basket, and a cloth thrown over him, both of course being much raised and distended by the captive they covered. The wizard now began a solemn promenade round the basket to the sound of the tom-tom, muttering mysteriously the while. By degrees the cloth and basket shrank down, growing smaller and smaller, till the latter appeared empty; then the lid was gently raised, and the net and ligatures thrown out: a second circuit made by the old gipsy effected the promised translation, and a white pigeon fluttered from the basket, and directed its flight (as we desired) to Poonah. The enchanter now affected great amazement, called on the boy to come forth, raised and shook the basket, and finally producing a long naked sword, thrust it with loud cries apparently into every crevice of the wicker-work. He then turned, and calling in the direction of Poonah, which was only seven miles off, was answered from a distance by the best ventriloquism I ever heard. This was a summons for the lad to return. He, or rather the pigeon, obeyed. The basket began to swell again, the cloth rose, and the young gipsy sprang forth, leaving us in admiration of his wonderful power of self-compression; as how he could have folded himself into so small a space, we were unable to conceive, nor how he avoided the sharp point of the sword.

The second exhibition was far more extraordinary, and more difficult; indeed I could not have believed it, had I not witnessed it myself. A young man stepped forward, and by the assistance of one of the Parsees, who acted as interpreter, informed us, 'that though it was not usual for the eyes to work as the hands did, he would for once, and to show his respect, &c. for the *burra sahib* (great man), use them in a similar manner.' A huge piece of stone, two or three feet thick and square, was then placed before him, to which two short lines were strongly attached, having at the ends a small round piece of tin, the size and shape of a sixpence.

Lifting his eyelids, and rolling the ball of the eye on one side in a most extraordinary manner, he stooped, inserted these coins inside the lid on the eyes, and closed the lid on them. His hands were then bound behind him, and raising himself slowly, he actually lifted the huge mass by the eyelids from the ground to the level of his waist. How long he would have continued to hold it I cannot tell, for the ladies present were so shocked at the really terrible exhibition, that they insisted on his being commanded to let it go. He was rewarded by a gift of ten rupees. We afterwards inquired if this power or art were common amongst the gipsy tribes, and were told it was not: being rather rare, and highly esteemed by them, the performer always expected an extra present from the spectators. Our Parsee servant added, that the practice entailed early blindness on its possessor.

A man then seated himself before us, and ordered one of his companions to 'light the fire,' a command which was immediately obeyed; the fireplace being actually the speaker's head, on which they placed a piece of something that looked like black mud, and on it kindled a blaze of some height. The fire-king, as he called himself, then opened his mouth, and received a lump of fire into it, from which he puffed volumes of smoke both from his mouth and nostrils; and certainly no one could look more like the 'Zatani' he personated than he did, for his eyes were large, and glitteringly black and white, his features deformed, and his skin swarthy. Then followed the equally common snake-charmers, with their huge basket of civilised reptiles. It is perhaps less curious to see these creatures move to the monotonous music which is supposed to influence them, than to examine at leisure, and with impunity, their different appearances; from the frightful cobra de capello, to the deadly cobra manilla, the bite of which I once narrowly escaped by the presence of mind of a young child, who, without speaking, pulled me back at the moment my foot was descending on the step where it lay. This snake exhibition is common all over India, as well as that which followed it—the juggler and his golden balls. Some of the gipsy women then advanced to display their skill; but they were anything but interesting 'magas.' For the most part they were old, and very ugly, and their chief cleverness appeared to consist in making a fountain of their nose, from which they showered in a continuous stream the water they drew into their mouth from a small tube.

Swordsmen followed, and really displayed the most wonderful skill with their weapons. When their fencing was concluded, they made a huge pile of their swords, the points being upwards, and leaped over it with great agility and boldness. The entertainment concluded by several men breaking cocoa-nuts with their heads—a feat which they achieved by throwing the huge fruit high into the air, and catching it on their skulls, which were certainly of the thickest, as, though they sounded fearfully, they did not appear hurt by a blow which separated the shell of the cocoa-nut. By the time they had finished their employment of nut-cracking, the sun had nearly set, and the burra sahib, after gracious commendations, and a very liberal bucksheesh, dismissed her Majesty's gipsy lieges, though they assured us they had many excellent tricks still in store. We were, however, weary, and believed the actors must be so too; therefore further proffers were declined, to their great surprise, as we were told; for the native princes or chiefs can never have enough of similar exhibitions, and tax the poor creatures' powers almost beyond endurance when they are thus brought before them. The exhibition had greatly amused us, both from the skill of the people and the picturesque effect of their wild appearance and costume. Their own apparent faith in the incantations they muttered, and the real credence bestowed on their powers by the native spectators, gave a reality to the scene which no English jugglery can ever possess. The sword exercise and cocoa-nut breaking were accompanied by shrill,

animated, and exciting cries. Of their skill in palmistry we were unable to judge, as we did not understand their language; but we were told that their prophetic gifts are very similar to those of the European brethren.

About three or four days afterwards, as we were returning from a drive, we met the whole tribe on their march back to the mountains. The road was narrow, and they were therefore obliged to move to one side, passing in a long-continued and most picturesque file, beneath the sweet mimosa-trees that bordered the way. One might almost have fancied himself living in the age of the Patriarchs, and witnessing the journeyings of a people, as he gazed on them. The strong men came first, each armed with a tall staff; then the women, bearing their infants on their hips, or leading the young children by the hand; old crones and 'ancient men' followed, with such cattle as they possessed, and bundles, containing, as we supposed, their property. They all salamed us with kindly smiles as they glided by; and we watched them with considerable interest for some time, the great plain they traversed permitting us to see them till they were lost in the dim though brief twilight. We never saw the gipsies of the Deccan more; but we have often thought and talked of them, and regretted that the energies they displayed, and the toil by which they must have brought many of their performances to perfection, had not been more worthily employed and better directed. They follow strictly the wise injunction, '*Whatsoever thy hand findeth to do, do it with all thy might;*' though unhappily their hand, through ignorance, finds little to do that is useful or becoming rational beings; and they are thus far examples to those who, living in the light of civilisation, never exert the capabilities, whether mental or physical, which their Creator has bestowed. Many a sluggard of our enlightened Europe might thus derive a useful lesson from the wild gipsies of Hindoostan.

A SECOND GLANCE AT MR MACAULAY'S HISTORY.

MR MACAULAY'S book must undoubtedly be what is called 'the book of the season.' It comes at an opportune time; in the midst of the revolutions of so many despotic governments, telling the tale of the sober and bloodless revolution which we passed through a hundred and sixty years ago—made sober and bloodless because we had never, like the continental nations, allowed our early popular institutions to be torn from us, and therefore had always something of a time-honoured character round which to rally. The whole story of James II.'s reign reads like a drama or a romance. It is a fair struggle between two principles, with victory or death for the issue. On one side a monarch, naturally weak, and not very good-hearted, driven by bigotry into tyrannical courses, with only the frail support of a few profligate statesmen, and a sentiment of loyalty which, though tinged with superstition, was insufficient to sustain men under extreme practical sufferings and dangers; on the other, 'a noble and puissant nation rousing herself, like a strong man after sleep, and shaking her invincible locks,' to throw off a yoke whose whole merits were of an abstract kind, but which, in such an age, it was almost impiety to challenge. The very struggles of the latter party with their own prejudices are intensely interesting. Mr Macaulay tells the story, we think, somewhat too rhetorically; yet is always animated, picturesque, and entertaining. It will be very curious to find his volumes so universally read as they must be, for it will show how much public attention to a book is affected by peculiarities in writers, by the presumption of their degrees of information, and perhaps also in some measure by currents of taste. We are able to mention, on the best authority, that, upwards of twenty years ago, a history of the English Revolution was published by a

respectable writer, and that the sale amounted to only one copy!

It would require ten times our space to present any adequate samples of this narrative; but even were that at our command, we would still recommend our readers to go to the book itself: there only can they obtain a thorough idea of the conflict carried on between 1685 and 1688. Perhaps the most intensely-interesting piece of narration is that of Monmouth's insurrection, and its fearfully bloody close. One cannot read without sympathetic anguish of the vain pleading of this unhappy leader for his life before an uncle who knew not pity. The brutalities of Jeffreys make it impossible not to feel a stern pleasure in his own ultimate humiliation and wretched end. We still think, however, that there is wanting in this, as in every other history of the period, a sufficient exposition of the causes of all the bad doings of the latter Stuart governments, in the terrors from which they were a reaction. We are left to wonder at the indignities put on the poor Earl of Argyle, which seem the most wanton and uncalled-for wickedness. The authors of these indignities felt still burning in their bosoms what we know nothing of—the recollection of the similar indignities put by a kingless parliament on Montrose—which this very earl and his father, it was said, had triumphantly witnessed. Why did men fool themselves with the doctrine of the divine right of kings? Nothing is without a cause. This folly was merely a counteraction against other fanatics, who thought they might treat kings as those of Israel were treated by the Hebrew prophets and people, and who had actually brought one monarch to a violent death. Men submitted to the worst tyranny of the infatuated James, because they had learned thirty years before that there was a worse tyranny in sanctified brewers and leather-sellers. The king himself had seen his father, after many concessions, put to death, and the government destroyed. It was still unsettled—perhaps it is not yet settled—whether the concessions or their insufficiency was the cause of the evil. A wiser man might have doubted whether he should recede or go on. Then it is scarcely possible in our cool days to judge of the religious feelings which were the immediate animating cause of all movements in those times, when the many wonderful and agitating things in the Bible were as yet but freshly burst on the European mind, and men had not half learned in what light they ought to be regarded. Scarcely, we apprehend, could the sincerest Catholic of our day even approach to a conception of the state of mind of King James, with his convictions, enduring for an hour the predominance of the reformed religion. Mr Macaulay, with all the amplitude of his information, is here as deficient as any of his predecessors.

The freedom of Mr Macaulay's sketches of familiar things will be relished as a delightful relief to the sobriety of political narrative. Dr Robertson would have been too dignified to descend to such matters—Henry would have brought them in with the dryness of a catalogue. It is reserved for the historical writer of our age to paint a class of people and a department of manners with the unrestrained pencil of La Bruyere and Addison. Take, for example, this little bit respecting the Popish country squire of James II.'s time:—'Excluded, when a boy, from Eton and Westminster, when a youth, from Oxford and Cambridge, when a man, from parliament and from the bench of justice, he generally vegetated as quietly as the elms of the avenue which led to his ancestral grange. His corn-fields, his dairy and his cider press, his greyhounds, his fishing-rod and his gun, his ale and his tobacco, occupied almost all his thoughts. With his neighbours, in spite of his religion, he was generally on good terms. They knew him to be unambitious and inoffensive. He was almost always of a good old family. He was always a Cavalier. His peculiar notions were not obtruded, and caused no annoyance. He did not, like a Puritan, torment himself and others with scruples about everything that was

pleasant: on the contrary, he was as keen a sportsman, and as jolly a boon companion, as any man who had taken the oath of supremacy and the declaration against transubstantiation. He met his brother squires at the cover, was in with them at the death, and, when the sport was over, took them home with him to a venison pasty and to October four years in bottle. The oppressions which he had undergone had not been such as to impel him to any desperate resolution. Even when his church was barbarously persecuted, his life and property were in little danger. The most impudent false witnesses could hardly venture to shock the common sense of mankind by accusing him of being a conspirator. The Papists whom Oates selected for attack were peers, prelates, Jesuits, Benedictines, a busy political agent, a lawyer in high practice, a court physician. The Roman Catholic country gentleman, protected by his obscurity, by his peaceable demeanour, and by the good-will of those among whom he lived, carted his hay or filled his bag with game unmolested, while Coleman and Langhorne, Whitbread and Pickering, Archbishop Plunkett and Lord Stafford, died by the halter or the axe.'

Our author's account of the coffee-houses of the seventeenth century looks more like a paper in Bentley or Colburn than a page of a large historical work; yet there can be no doubt that it is as essential to that work as the gravest accounts of parliamentary debates and councils of state. 'The coffee-house must not be dismissed with a cursory mention. It might indeed at that time have been not improperly called a most important political institution. No parliament had sat for years. The municipal council of the city had ceased to speak the sense of the citizens. Public meetings, harangues, resolutions, and the rest of the modern machinery of agitation, had not yet come into fashion. Nothing resembling the modern newspaper existed. In such circumstances, the coffee-houses were the chief organs through which the public opinion of the metropolis vented itself. The first of these establishments had been set up in the time of the Commonwealth by a Turkey merchant, who had acquired among the Mohammedans a taste for their favourite beverage. The convenience of being able to make appointments in any part of the town, and of being able to pass evenings socially at a very small charge, was so great, that the fashion spread fast. Every man of the upper or middle classes went daily to his coffee-house to learn the news, and to discuss it. Every coffee-house had one or more orators to whose eloquence the crowd listened with admiration, and who soon became, what the journalists of our own time have been called, a fourth estate of the realm. The court had long seen with uneasiness the growth of this new power in the state. An attempt had been made during Danby's administration to close the coffee-houses. But men of all parties missed their usual places of resort so much, that there was a universal outcry. The government did not venture, in opposition to a feeling so strong and general, to enforce a regulation of which the legality might well be questioned. Since that time ten years had elapsed, and during those years the number and influence of the coffee-houses had been constantly increasing. Foreigners remarked that the coffee-house was that which especially distinguished London from all other cities; that the coffee-house was the Londoner's home; and that those who wished to find a gentleman, commonly asked not whether he lived in Fleet Street or Chancery Lane, but whether he frequented the Grecian or the Rainbow. Nobody was excluded from those places who laid down his penny at the bar. Yet every rank and profession, and every shade of religious and political opinion, had its own head-quarters. There were houses near St James's Park where the fops congregated, their heads and shoulders covered with black or flaxen wigs, not less ample than those which are now worn by the Chancellor and by the Speaker of the House of Commons. The wig came from Paris, and so did the rest of the

fine gentleman's ornaments—his embroidered coat, his fringed gloves, and the tassel which upheld his pantaloons. The conversation was in that dialect which, long after it had ceased to be spoken in fashionable circles, continued in the mouth of Lord Foppington, to excite the mirth of theatres. The atmosphere was like that of a perfumer's shop. Tobacco in any other form than that of richly-scented snuff was held in abomination. If any clown, ignorant of the usages of the house, called for a pipe, the sneers of the whole assembly and the short answers of the waiters soon convinced him that he had better go somewhere else. Nor indeed would he have had far to go, for, in general, the coffee-rooms reeked with tobacco like a guard-room; and strangers sometimes expressed their surprise that so many people should leave their own firesides to sit in the midst of eternal fog and stench. Nowhere was the smoking more constant than at Will's. That celebrated house, situated between Covent Garden and Bow Street, was sacred to polite letters. There the talk was about poetical justice, and the unities of place and time. There was a faction for Perrault and the moderns, a faction for Boileau and the ancients. One group debated whether the "Paradise Lost" ought to have been in rhyme. To another, an anxious poetaster demonstrated that "Venice Preserved" ought to have been hooted from the stage. Under no roof was a greater variety of figures to be seen—earls in stars and garters, clergymen in cassocks and bands, pert templars, sheepish lads from the universities, translators, and index-makers in ragged coats of frieze. The great press was to get near the chair where John Dryden sat. In winter that chair was always in the warmest nook, by the fire; in summer, it stood in the balcony. To bow to him, and to hear his opinion of Racine's last tragedy, or of Rossa's treatise on epic poetry, was thought a privilege. A pinch from his snuff-box was an honour sufficient to turn the head of a young enthusiast. There were coffee-houses where the first medical men might be consulted. Dr John Radcliffe, who, in the year 1685, rose to the largest practice in London, came daily, at the hour when the Exchange was full, from his house in Bow Street, then a fashionable part of the capital, to Garraway's, and was to be found surrounded by surgeons and apothecaries at a particular table. There were Puritan coffee-houses where no oath was heard, and where lank-haired men discussed election and reprobation through their noses; Jew coffee-houses, where dark-eyed money-changers from Venice and from Amsterdam greeted each other; and Popish coffee-houses where, as good Protestants believed, Jesuits planned over their cups another great fire, and cast silver bullets to shoot the king.

Everywhere Mr Macaulay takes the freedom to introduce circumstances and associations in a manner new to history. We are told that, on the breaking out of Monmouth's rebellion, a play of Dryden's failed for want of attendance at the theatre. Persons still living have seen the daughter of the servant who waited on the Earl of Faversham when he halted to fight Monmouth at Sedgemoor. Monmouth left a mistress, whom he considered as his wife in the sight of Heaven: her fate is touched on with the skill of the modern literary artist. The unhappy man has perished on Tower Hill, and been laid amongst the dust of many heroic personages in the Tower Chapel. 'Yet a few months, and the quiet village of Toddington in Bedfordshire witnessed a still sadder funeral. Near that village stood an ancient and stately hall, the seat of the Wentworths. The transept of the parish church had long been their burial-place. To that burial-place, in the spring which followed the death of Monmouth, was borne the coffin of the young Baroness Wentworth of Nettlestede. Her family reared a sumptuous mausoleum over her remains: but a less costly memorial of her was long contemplated with far deeper interest. Her name, carved by the hand of him whom she loved too well, was, a few years ago, still discernible on a tree in the adjoining park.' Thus, too, when William lodges for a day at Littlecote

Hall, we are reminded of the mysterious tragedy enacted in it in the time of the Tudors, as narrated in the notes to 'Rokeby.' A historian of the last age, writing about the arrival of the Dutch Guards at Whitehall, and having to mention that they had to meet the English Guards under Lord Craven, would have mentioned Lord Craven and nothing more. Mr Macaulay introduces him thus: 'They were commanded by William, Earl of Craven, an aged man who, more than fifty years before, had been distinguished in war and love, who had led the forlorn-hope at Creutznach with such courage, that he had been patted on the shoulder by the great Gustavus, and who was believed to have won from a thousand rivals the heart of the unfortunate queen of Bohemia. Craven was now in his eightieth year; but time had not tamed his spirit.' Such references throw a flood of fresh interest on a historical narration.

Mr Macaulay says—'The press now often sends forth in a day a greater quantity of discussion and declamation about the condition of the working-man, than was published during the twenty-eight years which elapsed between the Restoration and the Revolution. But it would be a great error to infer, from the increase of complaint, that there has been any increase of misery.' He proceeds to show that the agricultural labourers, who were four-fifths of the working population, had then four shillings a week, without food, in ordinary districts, and from five to six shillings in the more favoured. Wheat was then as dear as now. It was seventy shillings a quarter in 1661, when the justices at Chelmsford fixed the wages of the Essex labourer at six shillings in summer, and seven in winter. 'These facts,' says our author, 'are in perfect accordance with another fact which seems to deserve consideration. It is evident that, in a country where no man can be compelled to become a soldier, the ranks of an army cannot be filled if the government offers much less than the wages of common rustic labour. At present, the pay and beer money of a private in a regiment of the line amount to seven shillings and sevenpence a week. This stipend, coupled with the hope of a pension, does not attract the English youth in sufficient numbers; and it is found necessary to supply the deficiency by enlisting largely from among the poorer population of Munster and Connaught. The pay of the private foot soldier in 1685 was only four shillings and eightpence a week; yet it is certain that the government in that year found no difficulty in obtaining many thousands of English recruits at very short notice. The pay of the private foot soldier in the army of the Commonwealth had been seven shillings a week—that is to say, as much as a corporal received under Charles II.; and seven shillings a week had been found sufficient to fill the ranks with men decidedly superior to the generality of the people. On the whole, therefore, it seems reasonable to conclude that, in the reign of Charles II., the ordinary wages of the peasant did not exceed four shillings a week; but that, in some parts of the kingdom, five shillings, six shillings, and during the summer months, even seven shillings, were paid. At present, a district where a labouring man earns only seven shillings a week is thought to be in a state shocking to humanity. The average is much higher; and in prosperous counties the weekly wages of husbandmen amount to twelve, fourteen, and even sixteen shillings.'

The remuneration of the manufacturing artisan was on no better scale. 'In the year 1680, a member of the House of Commons remarked that the high wages paid in this country made it impossible for our textures to maintain a competition with the produce of the Indian looms. An English mechanic, he said, instead of slaving like a native of Bengal for a piece of copper, exacted a shilling a day. Other evidence is extant, which proves that a shilling a day was the pay to which the English manufacturer then thought himself entitled, but that he was often forced to work for less. The common people of that age were not in the habit of meeting for public discussion, of haranguing, or of petitioning parliament.

No newspaper pleaded their cause. It was in rude rhyme that their love and hatred, their exultation and their distress, found utterance. A great part of their history is to be learned only from their ballads. One of the most remarkable of the popular lays chanted about the streets of Norwich and Leeds in the time of Charles II. may still be read on the original broadside. It is the vehement and bitter cry of labour against capital. It describes the good old times when every artisan employed in the woollen manufacture lived as well as a farmer. But those times were past. Sixpence a day now was all that could be earned by hard labour at the loom. If the poor complained that they could not live on such a pittance, they were told that they were free to take it or leave it. For so miserable a recompense were the producers of wealth compelled to toil, rising early, and lying down late, while the master clothier, eating, sleeping, and idling, became rich by their exertions. A shilling a day, the poet declares, is what the weaver would have, if justice were done. We may therefore conclude that, in the generation which preceded the Revolution, a workman employed in the great staple manufacture of England thought himself fairly paid if he gained six shillings a week.

It is added—'When we pass from the weavers of cloth to a different class of artisans, our inquiries will still lead us to nearly the same conclusions. During several generations, the Commissioners of Greenwich Hospital have kept a register of the wages paid to different classes of workmen who have been employed in the repairs of the building. From this valuable record it appears that, in the course of 120 years, the daily earnings of the bricklayer have risen from half-a-crown to four-and-tence; those of the mason from half-a-crown to five-and-threepence; those of the carpenter from half-a-crown to five-and-fivepence; and those of the plumber from three shillings to five-and-sixpence.

'It seems clear, therefore, that the wages of labour, estimated in money, were, in 1685, not more than half of what they now are; and there were few articles important to the working-man of which the price was not, in 1685, more than half of what it now is. Beer was undoubtedly much cheaper in that age than at present; meat was also cheaper, but was still so dear, that there were hundreds of thousands of families who scarcely knew the taste of it. In the cost of wheat there has been very little change. The average price of the quarter, during the last twelve years of Charles II., was fifty shillings. Bread, therefore, such as is now given to the inmates of a workhouse, was then seldom seen, even on the trencher of a yeoman or of a shopkeeper. The great majority of the nation lived almost entirely on rye, barley, and oats.

'The produce of tropical countries, the produce of the mines, the produce of machinery, was positively dearer than at present. Among the commodities for which the labourer would have had to pay higher in 1685 than his posterity pay in 1848, were sugar, salt, coals, candles, soap, shoes, stockings, and generally all articles of clothing and all articles of bedding. It may be added, that the old coats and blankets would have been not only more costly, but less serviceable than the modern fabrics.'

Mr Macaulay then proceeds to show that the proportion of the people which received parochial relief in the reign of Charles II. was larger than even now. He admits that the labouring people of that age derived some advantage from commons now closed to them; but against this he places advantages of a different kind, proper to the present age. 'Of the blessings which civilisation and philosophy bring with them, a large proportion is common to all ranks, and would, if withdrawn, be missed as painfully by the labourer as by the peer. The market-place which the rustic can now reach with his cart in an hour, was, a hundred and sixty years ago, a day's journey from him. The street which

now affords to the artisan, during the whole night, a secure, a convenient, and a brilliantly-lighted walk, was, a hundred and sixty years ago, so dark after sunset, that he would not have been able to see his hand; so ill paved, that he would have run constant risk of breaking his neck; and so ill watched, that he would have been in imminent danger of being knocked down and plundered of his small earnings. Every bricklayer who falls from a scaffold, every sweeper of a crossing who is run over by a carriage, now may have his wounds dressed and his limbs set with a skill such as, a hundred and sixty years ago, all the wealth of a great lord like Ormond, or of a merchant-prince like Clayton, could not have purchased. Some frightful diseases have been extirpated by science, and some have been banished by police. The term of human life has been lengthened over the whole kingdom, and especially in the towns. The year 1685 was not accounted sickly; yet in the year 1685 more than one in twenty-three of the inhabitants of the capital died. At present, only one inhabitant of the capital in forty dies annually. The difference in salubrity between the London of the nineteenth century and the London of the seventeenth century, is very far greater than the difference between London in an ordinary season and London in the cholera.

'Still more important is the benefit which all orders of society, and especially the lower orders, have derived from the mollifying influence of civilisation on the national character. The groundwork of that character has indeed been the same through many generations, in the sense in which the groundwork of the character of an individual may be said to be the same when he is a rude and thoughtless schoolboy, and when he is a refined and accomplished man. It is pleasing to reflect that the public mind of England has softened while it has ripened, and that we have in the course of ages become not only a wiser, but also a kinder people. There is scarcely a page of the history or lighter literature of the seventeenth century which does not contain some proof that our ancestors were less humane than their posterity. The discipline of workshops, of schools, of private families, though not more efficient than at present, was infinitely harsher. Masters, well born and bred, were in the habit of beating their servants. Pedagogues knew no way of imparting knowledge but by beating their pupils. Husbands of decent station were not ashamed to beat their wives. The implacability of hostile factions was such as we can scarcely conceive. Whigs were disposed to murmur because Stafford was suffered to die without seeing his bowels burned before his face. Tories reviled and insulted Russell as his coach passed from the Tower to the scaffold in Lincoln's Inn Fields. As little mercy was shown by the populace to sufferers of a humbler rank. If an offender was put into the pillory, it was well if he escaped with life from the shower of brickbats and paving-stones. If he was tied to the cart's tail, the crowd pressed round him, imploring the hangman to give it the fellow well, and make him howl. Gentlemen arranged parties of pleasure to Bridewell on court days, for the purpose of seeing the wretched women who beat hemp there whipped. A man pressed to death for refusing to plead, a woman burned for coining, excited less sympathy than is now felt for a galled horse or an over-driven ox. Fights, compared with which a boxing-match is a refined and humane spectacle, were among the favourite diversions of a large part of the town. Multitudes assembled to see gladiators hack each other to pieces with deadly weapons, and shouted with delight when one of the combatants lost a finger or an eye. The prisons were hells on earth, seminaries of every crime and of every disease. At the assizes the lean and yellow culprits brought with them from their cells to the dock an atmosphere of stench and pestilence, which sometimes avenged them signally on bench, bar, and jury. But on all this misery society looked with profound indifference. Nowhere could be found that sensitive and rest-

less compassion which has in our time extended a powerful protection to the factory child, to the Hindoo widow, to the negro slave, which pries into the stores and water-casks of every emigrant ship, which winces at every lash laid on the back of a drunken soldier, which will not suffer the thief in the hulks to be ill-fed or overworked, and which has repeatedly endeavoured to save the life even of the murderer. It is true that compassion ought, like all other feelings, to be under the government of reason, and has, for want of such government, produced some ridiculous and some deplorable effects. But the more we study the annals of the past, the more shall we rejoice that we live in a merciful age—in an age in which cruelty is abhorred, and in which pain, even when deserved, is inflicted reluctantly, and from a sense of duty. Every class, doubtless, has gained largely by this great moral change; but the class which has gained most is the poorest, the most dependent, and the most defenceless.

These are things worth pondering upon by the working population of our time, and those who call themselves specially their friends. There is a prevailing disposition to attribute all the evils endured by the humbler class of people to political and social evils bearing with undue severity upon them, and peculiar to the present time. When you tell any man that he is subjected to external evils beyond his own control, he is extremely apt to overlook those which it depends on himself to remedy. It is to be feared that the present manner of addressing the working population is mainly of the kind which soothes them with the idea that they are victims who cannot help themselves. The very efforts everywhere making to furnish them with baths, reading-rooms, superior houses, &c. must help to foster this notion. The consequence is, that the working population lose the opportunity of doing any good for themselves. They live for the day, when, by a proper husbanding of their resources, they might take a far higher place, socially and morally, than they do. Such facts as those brought out by Mr Macaulay show at once how much less evil they now suffer, and how much more they might now do for themselves, than at any former period.

We now fairly conclude by jotting off a few pithy expressions of opinion on general subjects, which we find scattered in Mr Macaulay's volumes:—'In every age, the vilest specimens of human nature are to be found among demagogues.' 'The common people are sometimes inconstant, for they are human beings. But that they are inconstant as compared with the educated classes, with aristocracies, or with princes, may be confidently denied. It would be easy to name demagogues whose popularity has remained undiminished, while sovereigns and parliaments have withdrawn their confidence from a long succession of statesmen. When Swift had survived his faculties many years, the Irish populace still continued to light bonfires on his birthday, in commemoration of the services which they fancied that he had rendered to his country when his mind was in full vigour. While seven administrations were raised to power, and hurled from it in consequence of court intrigues, or of changes in the sentiments of the higher classes of society, the profligate Wilkes retained his hold on the affections of a rabble whom he pillaged and ridiculed. Politicians who in 1807 sought to curry favour with George III. by defending Caroline of Brunswick, were not ashamed in 1820 to curry favour with George IV. by persecuting her. But in 1820, as in 1807, the whole body of working men was fanatically devoted to her cause.' 'Representative assemblies, public discussions, and all the other checks by which, in civil affairs, rulers are restrained from abusing power, are out of place in a camp. Machiavel justly imputed many of the disasters of Venice and Florence to the jealousy which led those republics to interfere with every act of their generals. The Dutch practice of sending to an army deputies, without whose consent no great blow could be struck, was almost equally pernicious.

It is undoubtedly by no means certain that a captain, who has been intrusted with dictatorial power in the hour of peril, will quietly surrender that power in the hour of triumph; and this is one of the many considerations which ought to make men hesitate long before they resolve to vindicate public liberty by the sword. But if they determine to try the chance of war, they will, if they are wise, intrust to their chief that plenary authority without which war cannot be well conducted. It is possible that, if they give him that authority, he may turn out a Cromwell or a Napoleon; but it is almost certain that, if they withhold from him that authority, their enterprises will end like the enterprise of Argyle.'

NOTES ON FERNS.

HORACE speaks of the fern as growing only to be burnt, and from his age to the present day, men have been but too apt to take the superficial reading of the remark without applying it economically. Few have regarded the fern otherwise than as a beautiful and graceful ornament, or a troublesome and obstinate weed, according as the romantic or the needful was their guiding principle. It would be well that the latter class should act more upon the letter of the poet, and they would probably find themselves well rewarded, not merely by ridding their fair fields of the intruding root, but also by a considerable quantity of kelp, which will be eagerly sought after by the soapmaker and the glass manufacturer; or they may economically employ the ashes so obtained in their own household, after the manner of the Welsh and others, who, burning the fern when green, make the ashes into balls with a little water; then dry them in the sun, and store them up, to take the place of soap, for which they form no indifferent substitute.

Again, when the occupier of the said fair fields, or it may be of yonder small allotment, newly reclaimed from the mountain or moor, has supplied his thrifty partner with the magic balls, which, like the good fairy in the old tale, are 'to cleanse all they touch,' he may advantageously employ his former enemy (for so a plant which in rich soils will extend its roots to a depth of six to eight feet may be considered) as an excellent manure. Let him cut it when green, and suffer it to rot, when he will soon discover its merits as an enricher of the soil. It yields nearly twice the quantity of salts contained in almost any other vegetable, and for this reason is particularly applicable to the potato, never failing, if buried beneath their roots, to produce a good crop. The rootstock of all ferns, though bitter, salt, and nauseous, is relished by pigs, and if boiled in their mash, or even in water, becomes an excellent food for them. As that of the bracken (*Pteris aquilina*) frequently mats together, and covers acres of unreclaimed ground, it may do great service in this way. Newman also mentions, on the authority of Mr Lees, that in the forest of Dean, the young shoots of this plant are cut before the fronds are unrolled, and boiled as a mash for pigs. This food will keep for a considerable time after it has been boiled, and it comes into use at a season when the cottager has some difficulty in supplying his pig from the garden. The roots of *Pteris aquilina* and common wall-fern, if boiled like carrots, are sweet and wholesome; so, says Gunner, are the young spring-shoots of the latter, if boiled and eaten like asparagus. An excellent farina may be procured from fern roots, which not only forms an article of food to the natives of Kamtchatka, but is also mixed in the bread of our more civilised neighbours in Normandy; whilst the Siberians use it in their beer, mixing one-third of the rootstock of *Aspidium filix mas* with two-thirds of malt. Ferns also form in Norway an article of fodder for cattle, sheep, and goats. Being cut green, and dried in the open air, and, when required, steeped in warm water, the animals eat it readily, and in some instances fatten on it, though

it is of course a food used only in the depths of winter. To the value of ferns as litter it is needless to draw attention. In Glen Elg, Inverness, the stalks of the bracken are used for thatching houses, to which purpose the whole frond is applied in Wales; but this, though less expensive in labour, is far less durable.

While keeping in view the fern wash-balls, we must not omit to mention that the root of the Osmond royal (*Osmunda regalis*) yields a most excellent starch, so that the fern-provided mistress of a family need never blush for the linen of her household, however poor she may otherwise be. The common bracken, and in a less degree all the ferns, are, from their astringent nature, well adapted to the service of the tanner, and on the continent are extensively used by him in the preparation of kid and chamois leather.

The fern was formerly much valued as a medicine, but the discoveries of distant and richer lands have, in a great measure lessened the chemical value of many of the herbs which grow beneath our less ardent sun. The maiden's hair (*Adiantum*) is much used in coughs, sheathing the inflamed and irritable epiglottis. The 'capillaire' of our French neighbours is merely a distillation of this fern with orange-flower water and honey. It is, or was, also much used as a confection, or summer drink, as all who in their youthful days delighted in the tales of Berquin will testify.

The anthelmintic qualities of *Lastrea filix mas*, and most of its congeners, cause them even yet to form a part of the herbalistic *Materia Medica* of the country-women, who particularly esteem them against worms; whilst the *Asplenium*, as their name imports, have been highly valued in complaints of the viscera. The elderly women in Herefordshire, says Newman, collect *P. vulgare* as a remedy for hooping-cough: it is gathered in October and November, when full of seed, hung up to dry, and when used, boiled with coarse brown sugar. It may perhaps be well to mention that we have here only noticed the true ferns, though the remainder of the filices are not without their economical, as well as their superstitious interest, to which we shall now advert.

The fern was formerly regarded with superstitious reverence, and held to be endowed with supernatural powers. Nor will this astonish us, when we consider that the ancients, in common with the father of natural history, were unable to discover from whence proceeded the numberless young plants which they saw springing up on every side of the parent fern. Pliny expressly says that the ferns have neither flower nor seed;* and it was reserved for a comparatively modern age to discover the latter in abundance on the backs of the fronds. It is curious to mark how the accurate and minute observation of these men was, for want of a few leading principles, rendered subservient to the errors of superstition. In all their ingenious speculations, they delighted to work out some fancied resemblance between the tangible, natural peculiarities of their object, and its supposed powers; and thus, as the fruit of the fern was invisible, so must it possess the power of rendering invisible the fortunate man who should find and appropriate it. Of this fancy our early poets have given many illustrations. Thus Shakespeare, 'We have the recipe of fern-seed—we walk invisible'—Beaumont and Fletcher, 'Why, did you think that you had Gyges' ring, or the herb that gives invisibility?'—and rare Ben Johnson, 'I had no medicine, sir, to go invisible; no fern-seed in my pocket.'

Many, doubtless, were the attempts to find this powerful treasure; anxiously was it sought by the forbidden rover, the trembling criminal, perhaps by the treacherous and designing statesman; but vain was all their labour, and disappointedly they gave up their ineffectual attempts to discover nonentities, and make themselves invisible to mortal ken; for, as Bovet tells us, 'One went to gather it [fern-seed], and the spirits whisked about his ears like bullets, and sometimes

struck his hat and other parts of his body. In fine, though he apprehended that he had gotten a quantity of it secured in papers, and a box besides, he found all empty;' that is, the seed having been at length discovered, dark and malignant spirits, enraged at the prospect of man appropriating to himself their peculiar privilege, attacked the daring depredator (perchance under the forms of owls and bats), and bore from him his long-sought booty.

Nor was invisibility the only boon to be obtained by means of the fern-seed: it had other powers, darkly hinted at by some, and more openly declared by others: in fact it was a most powerful vegetable charm if gathered on St John's (midsummer) Eve, more so if the night, says Semnius, should prove tempestuous; and in later times, Gerarde speaks much of the uses to which superstition had applied the much-sought fern-seed. Dioscorides, Iraqus, and Schbruh, speak much and mysteriously of this plant as a charm against witchcraft; whilst Bovet gravely states his conviction that these 'are of the devil's own contriving; that having once ensnared men to an obedience to his rules, he may with more facility oblige them to a stricter vassalage.' Even serpents, it is to be supposed, were aware of the powers of this herb, as Pliny tells us that they are rarely found under it. In addition to the non-discovery of the seed, the 'strange figures and unknown letters' which were seen on cutting the stem across, had their influence on the susceptible minds of our forefathers.

Among the more practical superstitions respecting this tribe of plants, we may notice that of placing children on a bed of green fern as a cure for rickets. It may also be pleasant to the *ennuyée* to know that the goldilocks (*P. vulgare*) was formerly considered an infallible remedy for melancholia. We have a theory of our own on this subject, which we shall hereafter unfold.

It would be tedious to mention all the diseases for which ferns were considered panaceas; so, after stating that the root of *Polypodium dhyopteris* would, it was believed, take off the hair, we will proceed to our own superstition respecting melancholia, intreating such of our readers as may be troubled with this most wearing disease of the mind to pay great attention to our assertion that *P. vulgare*, in common with other ferns, will materially assist in effecting his or her cure. We do not even, like the wizards of old, ask for faith in our nostrum; we only ask obedience to our rules, and the faith shall be worked out by the cure perfected. Let the patient, say we, commence by such gentle strolls as shall bring him to the charmed spots where

'The fern delights to grow;'

let him gradually proceed to gather a few of the more striking and beautiful fronds; let him place them frequently and carefully before his eyes, examining them attentively, until he feel a strong desire to know something of their structure and history (if he be assisted by a microscope, the miracle will in all probability be more speedy), or wish to discover how many different kinds grow within the limits of his daily rambles; then let him have recourse to some of the many interesting and scientific botanical works which have been written for this purpose; let him study these works in the fields and woods, until he feel imbued with a quiet but intense love of beautiful and graceful forms of this most interesting tribe of plants—until he can say, from the depths of his heart,

'Dear as they are beautiful
Are those fern leaves to me—'

until, when he thinks of his former insipid pursuits, he can add,

'Far dearer to me yon lone vale o' green bracken;'

let him all this time remember that in Eastern lands, where they talk with flowers, the fern is the true and appropriate emblem of sincerity and friendship. Let him secretly bear the lessons thus learned in his bosom

* Phil. Nat. Hist. lib. 27, cap. lv.

when called upon to mingle in the crowded city; let him exhibit it somewhat more openly when amongst his own friends, family, and dependants; and our authority's word for it, the cure is completed.

EDUCATION OF THE DOMESTIC CIRCLE.

PARENTS possessed of tolerable means seldom neglect to send their children to school. They are often heard to say of their young people, 'Whatever advantage money can purchase for them in the way of education, we are willing to give them.' Having expended the money ungrudgingly, they are often surprised that their children do not turn out very well. The fact is, they expect too much from liberality in school fees—they are too apt to feel their consciences relieved as to their duty to the young by mere considerations of the cost in money. However well it may suit a busy father to depute the nurture of his children, and use his own time in money-making or in needful recreation, it is very certain that the children will be imperfectly educated if they have not been reared carefully and rationally in the domestic circle, and cost their parents, or some persons standing in the light of parents, a great deal of trouble over and above all that is purchaseable from the schoolmaster.

The education of the domestic circle is moral education. The fresh human beings continually coming into the world might be regarded as a colony of savages coming in amongst a civilised people, and requiring to be adjusted to the tone of the society of which they are henceforth to form a part. Their impulses are in full activity: the provocations to the working of these impulses lie full before them. The business is to train the impulses to submit to those checks and those modified or regulated movements which society pronounces to be desirable. It will not be by reading of texts, or hearing of precepts and maxims, that this will be done. It only can be done by training to habits—a duty requiring much time, great patience, and no small skill and judgment.

It is, then, an onerous duty, and yet its weight may be much lessened if a good method be adopted, and adopted sufficiently early. Something can be done with a child from a very early period of existence. For instance, if he cries, we may avoid a great evil if we abstain from administering dainties for the purpose of soothing him; or, on the other hand, from using him harshly by way of punishment. The crying of a child on account of any little accident or disappointment is less an evil to him than an annoyance to us: we probably attach too much consequence to the idea of keeping children *quiet*, as if quietness were in him a virtue. If, however, it appear really desirable to stop the crying of an infant, the best way is to produce a diversion in his mind. Create some novelty about or before him, and if it be sufficient to give a new turn to his feelings, he will become what is called 'good' immediately. This is a cheap way of effecting the object, and it can be attended by no imaginable bad consequences. It must be remarked, however, that we—that is, grown-up people—are ourselves the causes of much avoidable squalling among the young. A child is looking at something, or is enjoying himself in some little sport with a companion: from fondness, or some other cause, we snatch him up of a sudden in our arms: he cries. Can we wonder? Should any of us like to be whipped up from a dinner-table in the midst of our soup, or from a concert-room when Jenny Lind is enchanting all ears? Undoubtedly it is injustice to a child to treat him thus,

not to speak of the worse injustice of punishing him in such circumstances for crying. He is entitled to have his will consulted before we snatch him away merely for our own amusement. Should it be necessary to interfere with his amusements, or to put a stop to them, use diversion and kind words by way of softening matters, and we shall probably have nothing to complain of.

Our ancestors were severe with children. There used to be some terrible maxims about maintaining awe, and breaking or bending the will. Corporal correction was abundantly resorted to. The direct result of the system of terror was to produce habits of falsehood and barbarism; for there is no child who will not tell a lie if afraid of punishment on letting out the truth, and the beating he gets only serves as an example of violence for his own conduct towards brothers, sisters, and companions. Kindness is now the rule in fashion—upon the whole an improvement. An excess in this direction would, however, be as fatal as one of an opposite kind. It is not so much kindness that is required, as simple civility and justice. Treat children with courtesy, and as rational beings, and they will generally be found sufficiently docile. We hear obedience trumpeted as a first requisite; but the question is, how is a right kind of obedience to be obtained? Our opinion is, that the fewer commands we address to children the better. Ask them politely. It is difficult for any one, even a child, to refuse what is so asked. If they do, they lie so plainly in error, that little can be needed beyond a calm expression of opinion on the subject. They will be less likely to refuse a second time. This is very different from a command palpably disobeyed, in which case there must either be punishment to the child or a defeat to the parent. The imperative plan does not seem to work well. It leads to a constant contention between the parties—the child to escape duties which he has no pleasure in obeying, the parent to enforce an authority which is deficient in moral basis. The opposite method admits of the child having some satisfaction in complying. It trains him to free agency, and thus prepares him better for the world. It is a great mistake to try to suppress or wholly overrule the will of a child. The will is a good thing in him as in you. Try to take it along with you, and to direct it to good purposes, and you will find that you are accomplishing a great purpose in education. On the other hand, a constant appeal to the affections, as a means of obtaining compliance, would obviously be an error. If treated justly, and not unkindly, a child cannot avoid loving its parents. Trust to this love operating of itself in persuading to a compliance with all reasonable requests and an obedience to all reasonable rules.

Even tolerably amiable children, when placed together, will be found to have frequent little quarrels, the consequence of disrespectful words, or, perhaps, interferences with each other's property. Some are much more liable both to give and take offence than others. Nothing is more troublesome to a parent; for it is scarcely possible entirely to ascertain the merits of any case. The liability to such collisions will at least be diminished if the parents never fail to observe towards each other, and towards their servants and children, the rules of good-breeding; and if they, moreover, take every opportunity of inculcating the beautiful and happy results of domestic peace. These means, however, will be in vain if children are allowed too much time to spend in idleness. If entirely occupied, in whatever way—with lessons, with work, with amusement, or with reading or drawing—they will be very little liable to fall into discord. It should, accordingly, be regarded as one of the first duties of those having a charge of young people to keep them incessantly engaged in something which may interest their faculties.

As soon as their understanding fits them for such intercommunion, children should be made the companions, friends, and confidants of their parents. The old

rule was, that in their parents' presence they should be perfectly quiet. This might be a gratifying homage to the parent, but it was not education to the child. If a child is brought to a family table, he should be allowed to join in the family conversation, that he may learn to converse. It is both surprising and gratifying to observe how soon children work up to the standard of their parents' attainments, and how beautifully they repay the openness and confidence with which they are treated, by reposing the most unreserved confidence in return. They know the family position, the family prospects, objects, and wishes, and become deeply interested in them all. Affection proves a far more powerful check than severity: obedience is a word unknown in the family vocabulary, because the thing is never wanting. Co-operation, cheerful contribution by heart and hand to the family objects, is the principle of action. In such a family there is rarely anything entitled to the appellation of discord: there are no separations, no elopements, no acts of domestic rebellion. A smooth course of happy life flows on, and the old age of the parents, who have trained so much worth in their offspring, is soothed and cheered by the unremitting exercise of the very virtues which themselves have fostered and perfected.

This is no ideal picture. We could point to families where the scions of the house, and even the children of strangers, have been the subjects of a domestic education such as we describe, and where the results have been the realisation of the desideratum we set out with—namely, the adjustment of the fresh generation to the civilisation attained by the old.

THE HIGHLAND CONVOY.

A FEW months ago I indulged myself in a sail down the Firth of Clyde in one of the countless steamers of the river. To me this is like a returning voyage up the stream of time; for every murmur of these haunted waters is laden with the voices of other years, and from every nook of the varied shores there start forth to meet me the spirits of the past. I am in a dream, which is not all a dream, for the places are substantial realities, although the persons are shadows: and the spectral show receives no interruption from the cold stony images of humanity by whom I am surrounded on the deck, for these belong in a remarkable manner to the present world, and to the new form into which society has been cast in the course of the last thirty years.

On the occasion referred to, the somewhat uncommon circumstance occurred of my exchanging looks, and finally words, with one of my fellow-passengers. He was a man well on to fifty years of age; but although his head was already sprinkled with the snows of time, his step was elastic, his eye clear, though serious, and his forehead smooth and white, as if it possessed some natural power of repulsion to throw off the cares of the world, that draw the brows of other men into wrinkles. What attracted me, however, was his air of solitariness, his abstraction from the things and persons of the present, and I knew by intuition that he was conversing, like myself, with the world of shadows. This actually proved to be the case. He had left the Clyde (the opposite shore from mine) in early youth, and after a long pursuit of happiness and fortune, returned a few years ago, convinced that the former was an illusion, and the latter merely independence, irrespective of the amount of income. We were soon well acquainted; nay, old friends. And what wonder? since our companionship led us to trace back together for one score and ten years the stream of time, and made us feel, as we paced the deck side by side, that every step conducted us farther and farther from the living.

After some hours had been spent in this way, my new-old friend was curious to learn the circumstances of my return; but I had nothing to relate beyond the disagreeable impressions made upon me by the people, in their transition state between picturesque rudeness and cold refinement—a state in which they had lost the cordial warmth of the one, before gaining the elegance of the other.

'It is not that I mean,' said he. 'But after so long an absence, and so unexpected a return, did you meet with nothing remarkable, no incident, no adventure, no?'—I smiled, and my companion looked grave.

'It was too late in the day!' I replied, touching ostentatiously with my glove a whisker which is not yet *utterly* gray.

'It is not that I mean,' he repeated more impatiently, and with some touch of disdain. 'We are both of us, it is to be hoped, too old for romance, and too wise for the delusions of a sex placed among mankind as a trial and a test, a mockery and a punishment. You met, then, with nothing remarkable?—nothing to signalise your return?—nothing to stand forward as a landmark in your memory connecting the epochs of your life from boyhood even to middle age? Would but I could say the same!'

'Say anything but the same,' cried I. 'I am thankful that you have an adventure to relate, and you ought to be thankful that you have a listener to hear it. Let us sit down, for the evening has stolen upon us unawares, and there is nothing more to be seen on these dusky shores.'

'It was in the dusk,' began my companion, when we had seated ourselves side by side—

'At what season?'

'When the autumn was far advanced; when the Clyde, like our own heads, my friend, had put on her livery of gray and brown; and when the nights were long and chill, but steeped in the radiance of a harvest moon. My elder brother is a petty laird in the country we have been talking of, on the Highland or right bank of the river, and his house stands in a wild nook of the hills a little more than fifteen miles from the shore. I had informed him by letter of the time I expected to be with him; and, thanks to the regularity of this kind of navigation, I landed in a small boat from the steamer on the appointed day. This was the first time I had touched Scottish ground for thirty years; and even at the rude hamlet, well known to me in my early days, I observed some of the changes that were afterwards so obtrusive. Indeed the only individual among the lookers-on who harmonised completely with my boyish recollections was a wild-looking Highlander; and even him, in consequence of the change that had taken place in me, I could not help regarding with a feeling of distrust and dislike. And yet the fellow, with his erect athletic figure, his unkempt locks, flowing from beneath a broad blue bonnet, his mist-coloured plaid, drawn from one shoulder over a broad chest, with the end hanging down gracefully behind, and his trews, furled up to his knee, so as to display the naked leg and foot of a young Hercules, presented a fine specimen of the unreclaimed Gael. I believe, however, that my suspicions were at first excited by nothing more than the eager attention with which he regarded my baggage as I gave it into the charge of the boatman, and the avidity with which he listened to, and appeared to treasure up, my directions as to its being taken care of till sent for on the following day. When his keen eye caught mine fixed upon him with severity, he looked down instantaneously, as if afraid of betraying his thoughts, and shrank aside with a sudden abjectness of deference which by no means disarmed my suspicion.

Soon after, a new circumstance occurred to draw my attention to this man. Having taken some refreshment in the little public-house, to prepare me for a walk of fifteen miles over a mountainous country, I

pulled out my purse, to be ready to pay my reckoning as I went out. I had no more silver, and while hunting in a handful of gold for a half-sovereign to change, the little window of the room darkened, and I looked up: the Highlander stood outside, with his nose literally flattened against the glass, and his eyes fastened upon the treasure with a wolf-like glare that made me start. His expression, naturally wild and fierce, was at this moment tinged with an exulting joy, throwing an illumination, like that of a torch, over the whole face. A foreboding of evil crossed my mind; but instead of attending to it, I rose up like a man in a dream, and went out mechanically. I paid my reckoning, and took my way to the hills.' Here the narrator paused, and looked towards the darkening shore, as if tracing in imagination some route full of pain and peril.

'Come,' said I at length, 'proceed: I should not wonder if we hear a little more, before all is done, of your bare-legged vagabond!'

'Hurry me not,' replied my friend solemnly: 'it must come as it will, or not at all. As you proceed in this direction from the Clyde, the country is much confused with hills, woods, and masses of rock; but it is not till you arrive at the glen through which the mountain tributary rushes that waters my brother's property, that you observe the grander features of the picture. In the meantime, in following the wild road I had often traversed when a boy, I was struck with the *shrunk* character of the objects. Those hills appeared to me to be small, and those woods mere shrubberies, on which my imagination had hitherto dwelt as so many mountains and forests, and a strong feeling of disappointment began to gather upon my mind, when my thoughts were led suddenly into a new channel. On reaching the summit of an eminence lofty enough to afford a more extensive view than the huddled nature of the scenery usually permitted, I saw a plaided figure disappearing behind an angle of a rock in the distance. I saw this object only for an instant, but I could not be mistaken: it was the Highlander. I even thought he turned his head over his shoulder, as if to watch whether I was following; but in this I may have been mistaken. Now I am not more deficient in animal courage than another; but I had gold in my pocket, and papers of still more value, and although armed, like him, with a serviceable staff, I was conscious that I had been for many years out of training, and should be as easily plucked as a pigeon by that Gaelic vulture. In short, without a second thought, I forsook the beaten road, and trusting to my recollection of the face of the country, made for my destination by a circuitous route.

'It was now late in the afternoon, and if I would reach my brother's house before the departure of daylight, it was necessary to step out. I did so to some purpose; but after more than an hour's hard walking, I began to have some doubt as to the landmarks, and lost considerable time in ascending a hill to obtain a general view of the district. I found that my detour had been greater than I contemplated; but still I was right in the main, and I clearly saw a gap in the mountains beyond, in which was the resting-place I sought. But the strong lights on the higher ground, contrasted by the deep shadows below, made me begin to calculate time and distance in some anxiety; and when at length I descended to the level of the route I had chosen, it was not without uneasiness I found that daylight had entirely deserted the lower regions of the earth. Had this change come on gradually, I should perhaps have felt it little; but one moment to have the ruddy beams of the still visible sun in my eyes, and the next to be plunged in permanent and still deepening gloom, was, in circumstances like mine, a little trying to the nerves; but at that moment I saw on the summit of a hill before me, just touched, and no more, by the level rays of the west, a human figure. This would, in any case, have been a picturesque and striking object, bathed as it was in a mellow light, which appeared to sever it from the dark rounded mass on which it stood; but the out-

line of the plaid and bonnet invested it at the moment with a character of the preternatural; and as I stood gazing with distended eyes, I fancied that the Highlander was penetrating, with the glance of a bird of prey, the gloom in which I stood. But this absurd notion lasted not longer than a minute.'

'I use the freedom of saying,' said I, taking advantage of a catching of the breath which interrupted the narration—'I use the freedom of saying that it gives me much pleasure to hear it! I am tired of that thievish cateran, and I would we had you at the death-grips without more ado.'

'I was tired likewise,' continued my companion, 'and with more cause than you. Whether he had actually seen me I could not tell; but this I know, that when threading soon after a belt of fir, I saw him waiting for me at the opening as distinctly as I now see you. On this occasion I did not shun him. My pride was touched, and my temper chafed; and grasping my staff by the middle, I advanced to try the fate of battle, if it was that he wanted. When I reached the edge of the belt, the plaided figure was gone. It had flitted to a distance of twice the space I had traversed, and was just disappearing behind a mountain rock.

'But either owing to the familiarity of the appearance, or to the presence of danger of another kind, I soon ceased to think much of the Highlander. I was now entering upon the wild and romantic portions of the landscape; and those features, the contemplation of which in the daytime would have filled me with a poetical enjoyment, had now much more of the terrible than sufficed for the composition of the sublime. I could already hear, borne on the wailing night-wind, the roar of the mountain river, and was entering the savage valley, or rather glen on a larger scale, through which it wanders, now sweeping in a full deep stream, and now tumbling in headlong rapids. The ford I sought, as nearly as I could judge, was at least two miles distant; and between was a country not very easy of travel even in the daylight, and at this uncertain hour, full of danger for the unaccustomed wayfarer. Lamenting the folly which had exposed me to such perils, for the sake of escaping the perhaps imaginary one of a conflict with the Highland robber, I pushed cautiously on, now glaring at some indefinite shadow in my path, which might be the opening of an abyss, and now starting as the roar of waters broke upon my ear, coming up, as it were, from a chasm at my feet. Have you ever traversed a wild uneven country when the twilight was fading into night?'

'Yes,' said I, 'and one not very far from yours—within the huge shadow of Ben Lomond.'

'Then I need not describe the bewilderment of mind under which a man labours, the shock with which he strikes against a stone, while supposing that he is stepping down a declivity, and the headlong descent into which he plunges, while raising his foot to climb. In my case the uncertainty was all the more perplexing, from the knowledge I had that I was in the near neighbourhood of precipices, diving sheer down several hundred feet to the bed of the river. It now became darker and darker; the gusty wind came more wailingly over the heath; and although the harvest moon had long risen, the glare she gave at long intervals through the densely-packed clouds only served to prophesy the danger it did not reveal.'

'And the Highland thief? Where was he by this time?'

'I cannot tell. Sometimes I thought I saw his figure sketched upon the dull sky behind; and sometimes I heard—perhaps only in imagination—his footsteps close by my side. My thoughts, however, were now concentrated upon a much more imminent peril; for the night came down upon my path in thick darkness, and at length the moon ceased to emerge from the rack that hurried across the sky; but when the stratum of cloud was less dense than usual, merely signified her whereabouts by a faint spectral gleam, that wrapped the

world for an instant in a formless winding-sheet, and then left it to the blackness of the grave. My situation was very tantalising, for I could not be at any great distance from what I knew to be a safe and easy ford, at the opposite side of which my brother's lands commenced. It was impossible, however, to advance otherwise than slowly and cautiously; for although I could not tell the exact locality I was in, I knew that somewhere in this neighbourhood there were frightful precipices, plunging sheer down into the river, and every now and then I continued to hear the ominous voice of the waters ascending from depths that seemed close at my feet. It was impossible, however, that this could continue much longer. I had now been for a considerable time in the tract of the cliffs, and I should soon no doubt find the country begin to open, and sink into the smoothly-swelling mounds of turf that swept down like billows to the ford.

'I had in fact arrived at what appeared to me to be this point in my journey, for in front I suddenly missed—or imagined that I did so—the dark masses of shadow which the rocks and jungle had hitherto left upon the sky. I pushed forward with more confidence, although it was now almost pitch dark. I endeavoured to persuade myself that I recognised the very stones over which I stumbled; and when turning the angle of a rock, which I could feel like a wall upon my right hand, and almost see through the gloom, I was about to thank God that my difficulties were at an end. At that moment a wild cry smote upon my ear, and turning my head with a superstitious thrill, I saw, by one of the momentary glimpses of the moon, the plaided figure standing in relief against the sky. The idea immediately flashed through my brain that I, in my sheltered situation, must be unseen by him, and that it would be to the last degree absurd to dare the issue of an encounter which he had seemed to defer purposely till I was completely worn out, and almost fainting from fatigue. Onward, therefore, I plunged; but on turning the angle of the wall of rock, there was another and a very different cry! It was the roar of waters, softened by distance, and yet seeming to come from some fathomless abyss at my very feet. I could not resist my impetus, for the ground sloped, although I had the presence of mind to throw myself down; but even this was unavailing, and I rolled over the precipice!' Here the narrator paused to wipe his brow, although the evening was cold. I began to feel nervous. The lights on the shore seemed to dance before my eyes, and I acknowledge that I awaited the sequel of the adventure in some trepidation.

'You are over the precipice,' said I at length.

'Yes; but holding on, like grim death, to the top, and digging my feet into its crevices. Yet to what purpose? My head was rather under than above the summit of the cliff; and being able to find a resting-place only for the points of my toes, I had no purchase for an effort to climb. What possibility of escape was there left? Even had I been able to hang on for an indefinite time, I might be bleaching there for weeks, in that wild and lonely country, before attracting observation. I cried for help, hoping that the robber himself might hear me; but the sound fell dull and dead against the rock, and the kelpie voices below seemed to scream in derision. This was the rest to which I had returned after thirty years' battling with the world; this was the salutation I received from my native river! I think my brain began to wander, as the conviction gathered force that I could not much longer maintain my hold; for I replied to the shrieking cries that rose from the abyss, and yelled hoarsely, not in hope, but defiance. But this mood was not of long duration: it was the last symptom of the fever which burned in my blood, through over-excitement of mind and body; and as my limbs began to stiffen, and my fingers to lose sensation, a dreamy calm descended upon my soul.

'Then rose the spirits of memory upon the night.

Some there came from the village churchyard, embosomed in the gap of the mountains: they were my mother, two sisters, and a baby phantom, who opened its arms as of yore, and tried to say "Brother!" Some there came from beneath the tumbling surges of the Atlantic: they were my father and a young cousin. Some there came from the southron country, some from far lands, some from cities, some from hamlets: they were my friends, enemies, rivals, benefactors—fellow-wayfarers in the journey of life. How terrible it is to meet the dead! There was not one of that company I saw without self-reproach. Oh that I had listened to those saintly counsels which were wont to be poured into my ear in bed, till they mingled with the hymns of angels in my childish dreams! Oh that I had left harsh words unspoken, low sentiments unthought, ignoble deeds undone! And she!—is it possible that I judged her wrongly? Could that seeming phantom of delight be indeed a fiend of the abyss? or are the songs of poets true when they tell that faith, mercy, and gentleness are attributes of woman, and that

"Love is no cheat, and happiness no dream?"

'My dear friend,' said I, when he began to quote poetry, 'were not your fingers numbened by this time?'

'They were altogether devoid of sensation, and yet I felt that they were slipping slowly from their hold. At that moment a faint and momentary glimpse of the moon revealed a face looking down upon me from the brink of the cliff—a face which I recognised distinctly as that of the plaided Highlander. But what mattered this? I was surrounded by faces of all sorts, and the faint roar of the waters beneath was heavy with human voices. That this apparition was as unsubstantial as the rest, was evident from its looking at me with a strange and eager stare, without moving hand or foot either to rescue or destroy me; and yet it was not without a shudder that I saw it leap wildly from the precipice, and felt the waving of its plaid as it shot past me into the abyss.

"*Fat ta deil is t'ou sticking to the stanes for, like a wul'-cat?*" cried the mocking spectre beneath me; and it drew my feet, with a sudden jerk, from the side of the precipice. My numbened fingers could no longer support the dead weight of my body; and as they slipped from their hold, a wild scream broke from my lips, and mingled with the manifold voices of the river below. I fell, and all was over.' Here the narrator paused, and wiped his brow again.

'You were over,' said I with a gasp, as a sudden suspicion flashed across my mind that my friend was insane! 'What became of you? Were you brained, or drowned, or hurried away in an eddy of the night-wind by the spectre Gael?'

'I lost my senses for a time, and when I reopened my eyes, the whole scene was steeped in a flood of moonlight. I was lying upon one of the billowy mounds of turf that sweep down to the ford; and looking up, I saw the edge of the face of rock from which I had fallen at a height of little more than six feet! Had I been able to put down my feet only a few inches, I should have felt the solid earth; but this being impossible without loosing my hold of the summit, I had hung for more than an hour in a position as terrible as the mind of man can conceive, although its terrors were purely imaginary.'

'And the Highlander?' said I, a little disconcerted, if the truth must be told, at my friend's safety.

'He was a favourite servant of my brother's, and had been deputed to conduct me home; although feeling, as he did instinctively, the mistrust and dislike with which I regarded him from the outset, and rendered diffident by his almost total ignorance of English, he had executed his mission by watching over me from a distance. After all, had it not been for the kindness of this faithful fellow's nature, united with his strength of limb, I must have passed the rest of the night on the hill-side, and thus submitted to a consummation I had

suffered so much to avoid. But he supported me to the ford; and then catching me up in his arms, as I drew back, afraid of my feebleness, bore me across the torrent, striding from stone to stone with a firmness and rapidity of step that were altogether marvellous.'

'And so ended the convoy of Donald Macdonald?'

'Not quite. Although a tender welcome, a good supper, and a cosy bed restored me to my usual vigour, that was not the last night I stuck to these awful stones "like a wul'-cat." To this day, when my health is out of order, or my mind darkened with the shadows of the world, the midnight rock, the plaided Gael, and the spectre faces of the past, return upon my dreams—and perhaps I do not feel myself to be the worse man for having endured the horrors of the Highland Convoy.'

L. R.

SIR JOHN BARROW.

THE life of Sir John Barrow, who has recently died full of years and of honours, presents a remarkable instance of the success which almost invariably attends untiring industry and perseverance of purpose. His was not that headlong enthusiasm which pursues with ardour some unattainable object, while it turns away with disgust from the homely duties and circumstances of life. The most marked features of his character were 'an inherent and inveterate hatred of idleness,' and a promptitude in seizing every opportunity of instruction, whereby he was enabled in early life to acquire a large stock of practical information, all of which proved serviceable to him during the more eventful period of his later years. He was born in June 1764, in a small cottage in the obscure village of Dragleybeck, near Ulverstone, North Lancashire; but perhaps his early life may be best described in his own words, as quoted from a very interesting autobiographical memoir which appeared only a year or two ago. He writes:—'I was the only child of Roger and Mary Barrow. The small cottage which gave me birth had been in my mother's family nearly two hundred years, and had descended to her aunt, who lived in it to the age of eighty; and in it my mother died at the advanced age of ninety. To the cottage were attached three or four small fields, sufficient for the keep of as many cows, which supplied our family with milk and butter, besides reserving a portion of land for a crop of oats. There was also a paddock behind the cottage, appropriated to the cultivation of potatoes, peas, beans, and other culinary vegetables, which, with the grain, fell to the labour of my father, who, with several brothers, the sons of an extensive farmer, was brought up to that business in the neighbourhood of the lakes. At the bottom of the paddock runs the beck or brook, a clear stream, that gives the name to the village, and abounds with trout. Contiguous to the cottage was also a small flower garden, which in due time fell to my share—that is, while yet a young boy, I had full charge of keeping up a supply of the ordinary flowers of the season. I did more: I planted a number of trees of different kinds, which grew well, but long after I left home many of them were destroyed. One of them, however, it appears, has survived, and must now be from seventy to seventy-five years old; and the mention of it kindles in my bosom a spark of gratitude, which an imputation of vanity even will not allow me to suppress.'

The only scholastic education Barrow ever received was at the Ulverstone Town Bank Grammar-school; at first under the tuition of an old man named Hodgson, who was very ignorant, but kind to his pupils. One day, being pleased with Barrow's proficiency, he brought him into his wife's shop (for she was a sort of stationer), and spreading on the counter a great number of books for young people, desired him to choose any one he pleased as a present. 'I pitched,' writes Sir John, 'upon a small history of the Bible with woodcuts, which so pleased the old man, that he foretold to my parents that I should prove a treasure to them. Trifling as

this was, it produced its effect, and has on many occasions recurred to my memory.'

When Barrow was about eight years old, the Town Bank School passed under the care of an excellent classical scholar, the Rev. William Tyson Walker, curate of the parish church; and he enjoyed this gentleman's instructions until he was thirteen, at which time he had advanced to the head of his class, having read Livy, Horace, Virgil, Homer, &c. He also acquired some knowledge of mathematics from a perambulating teacher who used to pay an annual visit to Ulverstone, and gave lessons in an apartment adjoining the school.

About this time one or two circumstances occurred, which, trivial as they may appear, exercised a considerable influence on the future events of his life. Just as he was about to leave school, a gentleman who had the care of Colonel Braddyll's estates in Yorkshire called on the master of Town Bank to know if he could recommend two of the youths best informed in arithmetic and geometrical calculations to assist him in taking an accurate survey of the colonel's extensive estate of Conish Priory, near Ulverstone. He immediately named Zaccheus Walker, his nephew, and young Barrow. They gladly agreed to the proposed arrangement; but neither of them feeling qualified to go alone, they consented on the understanding that all should be done under the direction of Mr Cottam, the agent to Colonel Braddyll.

'We remained,' writes Barrow, 'at the Priory about two months, in which time we completed the survey, to the satisfaction, as I afterwards learned, of Colonel Braddyll, and I may add, for my own part, to my incalculable benefit, derived from witnessing the practised methods of conducting a survey of the various descriptions of surface—for it contained all—level, hilly, woodland, and water; and it was not the less useful to me, from the practical knowledge acquired of the theodolite and of the several mathematical instruments in the possession of Mr Cottam. In fact, during our sojourn at the Priory, I so far availed myself of the several applications of these instruments, that, on arriving in London some years afterwards, I published a small treatise to explain the practical use of a case of mathematical instruments, being my first introduction to the press, for which I obtained twenty pounds, and was not a little delighted to send my first fruits to my mother.'

'Another circumstance occurred on leaving school, apparently of little importance, to which, notwithstanding, I must to a certain extent trace back my future fortunate progress in life, as will hereafter be shown. Five or six of the upper boys agreed to subscribe for the purpose of purchasing a celestial globe, and also a map of the heavens, which were lodged in the mathematical apartment of Town Bank School, to be made use of jointly or separately, as should be decided on. Our cottage at Dragleybeck was distant a mile or more, yet such was my eagerness of acquiring a practical knowledge of the globe and map, that I never omitted a starlight night without attending to the favourite pursuit of determining certain constellations and their principal stars, for one, two, or three hours, according as they continued above the horizon. It was a pleasure then, and a profit thereafter.'

About this time Barrow got acquainted with the son of a neighbouring farmer, an intelligent youth, who, having been severely wounded while serving in the navy, had returned home with the desire of studying for orders; and Barrow gladly assisted in 'brushing up his mathematics, and still more his classics;' while the midshipman as readily initiated him in the mysteries of navigation, a sort of knowledge which he thought might prove useful in case of his betaking himself to a seafaring life.

In this manner were Barrow's leisure hours passed during a year he spent at home: he also amused himself with scientific experiments; and having fallen in with an account of Benjamin Franklin's electrical kite, he prepared a string, steeped in salt water, with a glass

handle to it, and flying his kite, obtained abundance of sparks. An old woman, curious to see what was going on, our young philosopher could not resist the temptation to give her a shock, which so frightened her, that she spread a report that he was no better than he should be; for that he was drawing down fire from heaven. The alarm ran throughout the village, and his mother prevailed on him to lay aside his kite.

Barrow being earnestly desirous to increase his mathematical knowledge, and having been informed that there lived in the hills an old farmer named Gibson, who went among his neighbours by the appellation of the *wise man*, on account of his profound knowledge on almost every subject, and more especially of mathematics, he walked some eight or nine miles to see this rustic wonder, and was so charmed with his new acquaintance, that he repeated his visit three or four times. From this intercourse with Mr Gibson resulted happy consequences to him in after-life.

Barrow had now completed his fourteenth year, and began seriously to reflect on his future prospects. His parents were very desirous that he should enter into holy orders, and offered, out of their scanty means, to support him as a *sizar* in one of the universities; but he did not think himself suited for that sacred profession, and begged to take his chance a little longer, in the hope that something might turn up to afford him employment more suitable to his feelings. About this time a lady from Liverpool called one day at the cottage, and said, without ceremony, that her husband was Mr Walker, the proprietor of a large iron foundry in Liverpool; and that, in the course of her visit to the north, he had wished her to look out for an active intelligent youth to superintend the workmen, and keep the accounts of the factory, under the guidance and instruction of one who, from age and infirmity, could not long continue his employment; that the youth would live in the family; and that they had one son, of about ten years of age, who, being of a weakly habit, it was their object to give him instruction at home, at least for some time to come. 'Now,' she said, addressing young Barrow, 'from the character I have heard of you at Ulverstone, I think you would answer our purpose; and if you think that such an appointment would suit you, I will write to my husband on the subject.'

The proposal was not only most flattering, but otherwise welcome to a youth of fourteen, who longed for employment, and who was also desirous of relieving his parents from the expense of maintaining him at home. Accordingly, he was soon domesticated in Mr Walker's family, where he spent two years in useful and honourable occupation; but the death of his employer was followed by the disposal of the iron foundry to another merchant, and once more Barrow found himself without employment. Just at this time he happened to meet a relative of Mrs Walker's who was engaged in the Greenland whale-fishery, and who proposed that he should fill up a few months of his leisure time by taking a trip with him to the frozen seas; saying that he would be glad to give him a berth in the ship, and that such as his table afforded he should share with him. This kind offer was embraced with eagerness, and shortly after they embarked in the good ship 'Peggy,' and put to sea.

This northward voyage was full of interest to one possessing so inquisitive a turn of mind as Barrow. The plains of ice on the eastern coast of Greenland, with their immense herds of seals strewn on the surface; the jagged mountains of Spitzbergen, with their lower slopes clothed with lichens and saxifrage; the excitement of a whale chase and capture—such were the outward objects which captivated his attention, while at the same time he pursued the study of nautical lore both in its practice and theory so successfully, that Captain Potts said another voyage would make him as good a seaman as in his ship. He further attempted, by way of filling up the long day of perpetual sun, to write a poem on the arctic regions; but very soon dis-

covered that poetry was not his forte: nor were the materials he had to work upon of the most inviting nature to the Muse; 'for,' as he truly says, 'the feats and fates of whales and narwhales, morses, seals, bears, and foxes, malmouks, burgomasters, and strontjaggers, could afford but rugged materials for blank verse.'

After a few months' absence from England, he returned to his cottage home, bearing with him a couple of the jaw-bones of a whale, which he set up as gate-posts to the entrance of a small croft close to his parents' dwelling. Here he was gladly welcomed by many; but from none did he receive a more cordial reception than from his respected master the Rev. Mr Walker, and his old friend, the *wise man* of the hills, Mr Gibson. The latter asked a thousand questions about navigating ships in an icy sea; and having ascertained what progress Barrow had made in nautical science, urged him to aim at further advance. 'No young man,' he observed, 'should stop short in any pursuit he undertakes till he has conquered the whole; for, without a profession, as you are, you cannot tell to what good use knowledge of any kind may be applied. Shut up in this retreat, the extent of my knowledge is of a very limited and unproductive kind; but it has been of use to my two sons in London, one of whom stands high in the Bank of England, and the other is manager of Calvert's brewery: it has also been sometimes of use to my neighbours.'

'The good old farmer encouraged me to persevere in my studies, and especially in mathematics, which were a sure foundation for astronomy, and all the rest. I took leave, and thanked him for all his kindness.'

At this time Barrow's mind was much perplexed concerning his future course in life; but he was too manly to indulge in despondency; and it was curious enough that, through one of the sons of this *wise man*, came the first opening of which he felt any desire to avail himself; for, owing to the recommendation of Mr Gibson of the Bank, he obtained the situation of mathematical teacher in the academy of Dr James at Greenwich. There he spent between two and three years, afterwards fixing himself in London, where he communicated instruction in mathematics to many persons among the higher classes of society. In the course of the year 1791 he became acquainted with Sir George Staunton, who called on him one day to inquire whether he could bestow a portion of his leisure in instructing his only son, a boy of ten or eleven years of age. To this proposal Barrow gladly acceded. 'I suppose,' said Sir George, 'you are practically acquainted with astronomy, and know the constellations and principal stars by name? I am a great advocate for practical knowledge!' Barrow answered in the affirmative; and 'the constellations and astronomy,' he adds, 'brought vividly to my mind my old friend Mr Gibson, and the globe and the map of the Town Bank School; and I was more than ever persuaded that all is for the best.' Thus was laid the foundation of a friendship which ended only with life; and Barrow always acknowledged with gratitude that to Sir George Staunton's unvarying kindness he was indebted for all the good fortune which attended him through life.

A few months later, Sir George Staunton having been appointed to accompany Lord Macartney in his embassy to China, in the capacity of secretary of embassy and minister plenipotentiary, that gentleman contrived to have young Barrow's name placed on the list of the ambassador's suite as comptroller of the household; and this arrangement filled him with such joy, that (as he expresses it) he was 'overwhelmed with delight.'

Previous to launching out into the new world now opening before him, he contrived to visit his parents at Dragleybeck; and we cannot forbear noting down the brief sketch he gives of the good old couple at this period of his life. 'I found my parents happy and well; but my mother's eyesight, which had long been failing, was now quite gone; the principal uneasiness it occasioned her was her inability to attend divine service, the church being a mile from the cottage; my father

and mother having, for more than twenty years, never missed the two Sunday services; but my father read to her the morning lessons and the evening service regularly every Sunday. The loss of sight never interfered with my mother's usual cheerfulness, and the young ladies of Ulverstone were her constant and agreeable visitors.'

Barrow had just completed his twenty-eighth year when he sailed in Lord Macartney's suite on the 26th September 1792. Our space will not admit of any extracts from the journal he kept during his voyage to China, and visits to Chusan, Peking, and Canton. We may, however, be allowed to quote one passage which bears upon the earlier part of his history. Among the costly presents sent by George III. to the emperor of China, were several valuable mathematical and scientific instruments, which, on the arrival of the embassy in Peking, were delivered to the care of Barrow, in order that they should be fitted up in the great hall of audience, in the palace of Yuen-min-Yuen, for the emperor's inspection. This charge he felt to be a serious one, when he found himself surrounded by the members of the tribunal of mathematics, and other learned personages, all asking him questions concerning astronomy, mathematics, &c. 'How often,' he exclaims, 'when among these people, did I think of my poor old friend Gibson, and how much I was indebted to him!'

After an absence of two years from England, Barrow landed at Spithead in the ambassador's suite, on the 6th September 1794. Sir George Staunton's house was now his home, where, besides the instruction bestowed on Mr Staunton, he was busily employed in compiling and arranging the materials for Sir George's official account of the embassy to China. He, however, obtained a few weeks' leave of absence, to run down to Ulverstone to see his parents, whom he found quite well, and 'delighted at his safe return.' There he found himself looked upon as a curiosity; for at that time it was by no means so ordinary a matter to traverse the globe, as it is in the present day; and a man who had visited Peking, and seen the emperor of China, was regarded as a wonder.

On his return to London, Barrow resumed his usual course of life; and among his other engagements was that of accompanying Mr Staunton three days in the week to Kew Gardens, where they used to botanise with Aiton's 'Hortus Kuvensis' in their hands, which, in Barrow's future travels in South Africa, was of the greatest service to him, Kew being in possession of specimens of a large portion of the Flora of the Cape of Good Hope.

Towards the close of 1796, the Cape of Good Hope having fallen into our hands, its government was committed to Lord Macartney, who immediately appointed Barrow as his private secretary—a nomination equally honourable and agreeable to him; and on the 4th of May 1797 he landed in Cape Town in health and high spirits. Here a new sphere of duty awaited him, which he filled with the same energy and diligence which had marked his course throughout life. Owing to the refractory state of the Boers in the colony, Lord Macartney, on his first arrival, found himself encompassed with difficulties, which were increased by an utter ignorance of the geography of the country. He intrusted Barrow with a mission to the Boers at Graaff Reynet, which was exploratory as well as conciliatory in its object. Having fulfilled this mission most satisfactorily, he subsequently volunteered his services in other expeditions, with the view of becoming acquainted with the people, as well as with the productions of the country, and of ascertaining the geographical positions and boundaries of the various settlements, which at that time were most imperfectly known. 'Thus,' as he briefly expresses it, 'between the 1st of July 1796 and the 18th January 1797, I had traversed every part of the colony of the Cape of Good Hope, and visited the several countries of the Caffres, the Hottentots, and the Bosjesmen; performing a journey exceeding three thou-

sand miles on horseback, very rarely in a covered wagon, and full one-half of the distance as a pedestrian. During the whole time (with the exception of a few nights passed at the Drosdy-house of Graaff Reynet) I never slept under a roof, but always in a wagon, and in the cot that I brought with me in the good ship "Trusty" from England.'

His services on these occasions were duly appreciated by Lord Macartney, who, in the following year, appointed him to the situation of auditor-general of public accounts, civil and military, with a salary of L.1000; and Barrow was so overwhelmed with surprise and gratitude at this unexpected good fortune, that it literally took away his speech for a moment, so that he could only bow in silence to his kind benefactor. Soon afterwards, the narrative of his African travels was published in England, under the direction of his unfailing friend Sir George Staunton, who obtained for the work a sum of L.900. But this growing prosperity was damped by the loss of his venerable father, and the subsequent death of Sir George Staunton, who had deservedly won his most grateful and affectionate attachment.

He now resolved to 'sit down quietly to audit with diligence and regularity the public accounts, which was an important part of his duty; to marry a wife; and that being accomplished, to look out for a small comfortable house near the town, and to become a country gentleman in South Africa.' 'Accordingly,' he continues, 'at Stellensbosch, in August 1799, I was united in marriage to Miss Anna Maria Trüter, the only daughter of Peter John Trüter, Esq., member of the Court of Justice, a lady whose acquaintance I had made the first week of our arrival at the Cape. In the early part of 1800 I purchased a house, with a paddock, garden, and vineyard attached, named the Liesbeck Cottage, from the river of that name, which flowed past the foot of the grounds. My house looked on the west side of the Table Mountain, which sloped down almost to the gate, and presented a picturesque mass of varied rock and native plants, among which the erica and protea were conspicuous; and of the latter the argentea, or silver-tree, prevailed. My family consisted of myself, my wife and child, an old nurse, and four other servants. My stud was limited to two stout carriage-horses for drawing a curriole, and two saddle-horses. I had an Indian groom and a helper.'

At this pleasant home Mr Barrow passed about two years, in the diligent fulfilment of his official duties, as well as in attendance on other matters connected with the improvement of the colony; but in 1802, the Cape of Good Hope being, in compliance with the provisions of the treaty of Amiens, surrendered to the Batavian republic, Mr Barrow prepared to return to his native land, accompanied by his wife and child.

His services at the Cape had been fully appreciated by Lord Macartney and General Dundas, through whose influence he was, shortly after his arrival in England, presented to Mr Pitt and Lord Melville, who, on their accession to power in 1804, gave him the appointment of second secretary to the Admiralty. On the occasion of his first official visit to Lord Melville, he writes thus:—'In taking leave, with expressions of gratitude for his lordship's kindness—"By the way," he said, laughing, "I hope you are not a Scotchman?" "No, my lord; I am only a Borderer—I am North Lancashire." He then said, "Mr Pitt and myself, but chiefly the latter, have been so much taunted for giving away all the good things to Scotchmen, that I am very glad on the present occasion to have selected an Englishman!"'

Mr Barrow was still in the prime of life when he found himself placed in an honourable and useful position, where (with the interval of a few months) he served his country diligently during forty years—a most eventful period of our national history; and he says in his memoirs, with a certain degree of modest self-gratulation, that having served during that period under twelve or thirteen several naval administrations, he had

'reason to believe that he had given satisfaction to all of them;' adding—'I am happy in the reflection that I have experienced kindness and attention from all.'

Amid his numerous professional duties, he found time to write several popular works, as well as to contribute largely to our periodical literature;* and he observes that these mental exercises, conjointly with personal exertions and moderate habits, had, he believed, tended to keep up his 'flow of health and of animal spirits much beyond the usual period of human existence.' Sir James Graham seems to have truly portrayed his character when, after having perused his life of Lord Howe, he wrote as follows:—'So far from exclaiming, "How can my friend the secretary of the Admiralty find time to write a book?" I can speak from the experience of some years, that he never neglected a public duty; that he never was wanting in a kind office to a friend; and yet, from a wise economy of leisure, he always had a spare moment for some useful research or some literary occupation.'

Mr Barrow was also the zealous promoter of science, and lent his warmest support to those gallant men who perilled their lives in quest of a north-west passage in the arctic seas.

In 1835 he was surprised and gratified by the honour of a baronetcy being conferred on him; and the king's intentions were communicated to him in the following letter from Sir Robert Peel, which can scarcely be regarded as a merely complimentary one, bearing, as it does, the impress of truth:—

'WHITEHALL GARDENS, Feb. 1, 1835.

MY DEAR SIR—I have had the great satisfaction of proposing to the king to confer upon you the distinction of a baronet, and of receiving from his majesty the most cordial approbation of my proposal. The value of such a distinction depends mainly upon the grounds upon which it is offered; and I cannot help flattering myself that an unsolicited, and probably unexpected, honour conferred upon you by the king, on the double ground of eminence in the pursuits of science and literature, and of long, most able, and most faithful public service, will have, in the eyes of yourself, your family, and your posterity, a value which never can attach to much higher, when unmerited, distinctions. Believe me, my dear sir, most faithfully yours,

ROBERT PEEL.'

Sir John Barrow was still full of vigour and energy when, in his eighty-first year, he resolved to withdraw from public life, and 'to give place to a successor.' In accepting his resignation, the Board of Admiralty expressed their deep sense of the zeal with which he had rendered science subservient to our naval and commercial interests, as well as of his assiduous attention to the duties of his important office.

Many were the testimonies of regard and respect which followed him into the retirement of domestic life; but none were more gratifying to him than an address from the arctic voyagers, Parry, Franklin, Ross, and Back, presenting him with a valuable piece of plate, as a 'testimony of their personal esteem, and of the high sense they entertained of the talent, zeal, and energy' which he had 'unceasingly displayed in the promotion of arctic discovery.'

With such proofs of deserved esteem, the venerable baronet withdrew into the bosom of his family, and passed the evening of his days in peaceful and yet not idle seclusion. His autobiography was not completed until he had nearly accomplished his eighty-third year;

* The following are a list of Barrow's works:—The Life of Lord Macartney, in two vols. quarto; Travels in South Africa, 2 vols. quarto; Travels in China, 1 vol. quarto; Voyage to Cochin China, 1 vol. quarto; The Life of Lord Anson, 1 vol. octavo; The Life of Lord Howe, 1 vol. octavo; in the 'Family Library,' the Life of Peter the Great, and the Mutiny of the Bounty; Chronological History of Arctic Voyages, 1 vol. octavo; Voyages of Discovery and Research within the Arctic Regions, 1 vol. octavo; 208 Articles in the Quarterly and Edinburgh Reviews, and in the Encyclopædia Britannica.

and it is now only a few weeks since he departed this life, without either suffering or disease.

On the morning of Thursday, November 23, he took his usual walk, and on the evening of the same day he expired, in the presence of his beloved wife and children—how sincerely lamented they alone can tell who knew his worth in private as well as in public life.

OCCASIONAL NOTES.

LETTER FROM LAUNCESTON, VAN DIEMEN'S LAND.

In your 'Information for the People,' Vol. I. p. 639, edition 1842, you remark, 'there may be some persons who can follow out this matter, and invent rational amusements. They would deserve to be regarded as benefactors, and would probably find a substantial reward.' Upon this hint, may I have your permission to speak? Having long been on the look-out for everything falling in with this notion, I was delighted with your article; but partly from the expectation that you would be able to supply the want in your Journal at a future time; but which, hitherto, I have looked for in vain. I trust, however, you will confer this great favour on us, and not omit to return to the subject. I have not your book by me now to refer to, and may be repeating some that you have already dwelt on; if so, I must ask your excuse. I beg to enclose my list, and shall be truly glad if any of them prove useful.

The amusements naturally divide into two classes. First, where one of the party reads aloud, and the others are severally occupied in quiet, not, however, so abstracted but that they can readily attend to and join in the observations called forth by the book; namely—

Drawing.

Taking asunder, or examining locks, clocks, &c. Good practice for young people.

Cutting leaves of new books.

Arranging plants in a herbarium.

Arranging garden seeds.

Netting.

I can only find use for nets in my garden; but others may find greater demand for them.

Arranging and burning old letters.

Copying out extracts in prose or verse, and copying music.

The practised hand will find no difficulty in these.

Cutting and pasting newspaper extracts in scrap-books.

Most useful. The scrap-book should be folio size; and each extract indexed at the time of insertion.

Binding books—that is, resetting and repairing.

A nice occupation for young people, as, besides tending to the preservation, it induces a greater care and regard for their books.

Cutting out in paper.

Namely, shapes of the various counties, countries, &c. Also geometric figures. There might be a prize for the best cutter.

Modelling with cork.

Namely, castellated and other architectural works; machines, wheels, &c. Ships are the common choice of young modellers; but they are no favourites with me.

Wood carving.

This, I imagine, is an attractive pursuit in the present day. A young person could easily begin with an attempt at a set of chessmen. Horse-chestnuts do well instead of wood for beginners to try their hand.

DESCENT OF TALENT.

Being interested by your paper, No. 102, December 1845, on the Descent of Talent in the Male Line, I beg leave to send you a list of additional instances. Whatever becomes of the argument, the discussion of such a subject is a very interesting pastime—reviving recollections, stimulating curiosity, and leaving some improving effect on every mind. Permit me to add a short remark to those already advanced. When a genius springs from a family where neither parent has been remarked for talent, would not the public, from the better knowledge they must naturally have of the father, and seeing that no talent could be inherited apparently from him, be apt to conclude

as of course that the genius must needs come by the mother, and so give the maternal side generally that merit which is not its due?

Again, before you concluded your essay, I was disappointed that you did not allude approvingly to the greater merit which attaches, and which the world, I believe, readily allows, to the sex, where mothers, by their early care and love, educe and improve that talent which nature has implanted in their children, which, from whosoever side it spring, would be of little use, existing perhaps only as an undiscovered mine, but for her thought and motherly attention. That men of genius have attributed so much of their education to the early care of their mother, may have led to the belief that they were indebted to the mother also for their talents.

SCORCHING TO DEATH.

In the introduction to 'Birds of Australia,' Mr Gould relates a distressing incident, occasioned by a flood in the interior of New South Wales. In the course of his peregrinations, he had once or twice visited a cattle station, where Lieutenant Lowe and his nephew gave him a cordial reception. The gentlemen had come from a distance to superintend the shearing operations, and Mr Gould writes:—'Seven days after my departure from their dwelling, heavy rains suddenly set in; the mountain-streams swelled into foaming torrents, filling the deep gullies; the rivers rose, some to the height of forty feet, bearing all before them. The Namoi, having widely overflowed its banks, rolled along with impetuous fury, sweeping away the huts of the stock-keepers in its course, tearing up trees, and hurrying affrighted men and flocks to destruction. Before there was time to escape, the hut in which Lieutenant Lowe and his nephew were sojourning was torn up and washed away, and the nephew and two men, overwhelmed by the torrent, sank and perished. Lieutenant Lowe stripped to swim; and getting on the trunk of an uprooted tree, hoped to be carried down the eddying flood to some part where he could obtain assistance. But he was floated into the midst of a sea of water, stretching as far as he could discern on every side around him. Here he slowly drifted: the rains had ceased, the thermometer was at 100°, a glaring sun and a coppery sky were above him; he looked in vain for help; but no prospect of escape animated him, and the hot sun began its dreadful work. His skin blistered, dried, became parched and hard like the bark of a tree, and life began to ebb. At length assistance arrived—it came too late: he was indeed just alive, but died almost immediately. He was scorched to death!'

MUTUAL HELP.

The race of mankind would perish, did they cease to aid each other. From the time that the mother binds the child's head, till the moment that some kind assistant wipes the death-damp from the brow of the dying, we cannot exist without mutual help. All, therefore, that need aid, have a right to ask it of their fellow-mortals; no one who holds the power of granting can refuse it without guilt.—*Sir Walter Scott.*

WOODLAND VOICES.

Roaming 'mid the green savannas, autumn leaves so thickly falling,

I have listened breathlessly to the wood-bird sweetly calling;
I have looked upon the graves in the village churchyard nigh,
Where the silver moonlight streamed, and shadows fell mysteriously;

And the chiming tower-bells up among the ivy leaves,
Answered to the night owl's screech underneath the old church eaves.

And the wail of rushing winds, through the lonely woodlands near,
Seemed like wild harp-music sighing o'er the waters swift and drear;

Waters dark, and forests dim—holy stars that go and come
As the drifting storm-clouds sweep, whispering of a better home—
Tell me, if my mother's spirit looketh down from heaven above?
If departed souls remember aught of earthly care and love?

Ye can speak in thousand voices—ye can speak in fancy's tone—
Mystic songs—and heartfelt lays—as I wander forth alone;
And my answer, borne on air by the voiceless spirits nigh,
Spirits of the tempests whirl, borne aloft on memory's sigh—
Still re-echoes one sad strain—still repeateth one low moan—
A requiem for the dead—a dirge o'er my lamented one.

C. A. M. W.

RIPE BREAD.

Bread made of wheat flour, when taken out of the oven, is unprepared for the stomach. It should go through a change, or ripen, before it is eaten. Young persons, or persons in the enjoyment of vigorous health, may eat bread immediately after being baked without any sensible injury from it—but weakly and aged persons cannot—and none can eat such without doing harm to the digestive organs. Bread, after being baked, goes through a change similar to the change in newly-brewed beer or newly-churned buttermilk, neither being healthy until after the change. It not only has more nutriment, but imparts a much greater degree of cheerfulness. He that eats old ripe bread will have a much greater flow of animal spirits than he would were he to eat unripe bread. Bread, as before observed, discharges carbon, and imbibes oxygen. One thing in connection with this thought should be noticed by all housewives: it is, to let the bread ripen where it can inhale the oxygen in a pure state. Bread will always taste of the air that surrounds it while ripening—hence it should ripen when the air is pure. It should never ripen in a cellar, nor in a close cupboard, nor in a bedroom. The noxious vapours of a cellar or a cupboard never should enter into and form a part of the bread we eat. Bread should be light, well baked, and properly ripened before it should be eaten. Bread that is several days old may be renewed, so as to have all the freshness and lightness of new bread, by simply putting it into a common steamer over the fire, and steaming it half or three-quarters of an hour. The vessel under the steamer containing the water should not be more than half full, otherwise the water may boil up into the steamer and wet the bread. After the bread is thus steamed, it should be taken out of the steamer and wrapped loosely in a cloth, to dry and cool, and remain so a short time, when it will be ready to be cut and used. It will then be like cold new bread.—*American Farmer.*

GARDENING FOR CHILDREN.

This is the title of a little volume by the Rev. C. A. Johns, which seems to us well worthy of commendation, inasmuch as it is a practical manual of gardening, reduced in language, style, manner, and size to the apprehension of a child. We have some notion that the habitual study of the work will make children very capable of instructing in their turn the older members of the family; or at least that the latter will frequently be glad to have an opportunity of referring to its pages, instead of consulting more difficult and voluminous productions.

WORDS.

It is an old tale that Anselm, archbishop of Canterbury, who lived early in the twelfth century, and was known long after as Saint Anselmo, having a dispute with the Anglo-Norman barons regarding a matter of ecclesiastical authority (of which Anselm, like most of the canonised, was not a little jealous), undertook what was then regarded as perilous—a journey to Rome, in order to obtain the pope's casting vote on his side of the question. This the bishop accomplished to his heart's content, and returned in triumph with a letter written on parchment, after the fashion of the age, commanding the disputants to hear and obey him; but when it was read to them in full assembly, none of the nobility at that period being expected to read for themselves, they unanimously shouted, 'Does the bishop expect that we shall be swayed by a letter? It is nothing but words and sheepskin!'

Little did those fierce and haughty barons dream that, in the same fair counties of England where they exercised the power of pit and gallows, as old chroniclers have it, sheets frailer and more perishable than sheepskin should one day be found too strong for their feudal dungeons and rights of vassalage and serfdom.

'Words and sheepskin' was but the language of despotic barbarism, that knew its physical strength and could see no further; but the power of these things was felt even in the feudal ages. The excommunications that terrified princes; the exhortations by which all Europe was repeatedly roused to the Crusades; the Dooms-Day Book, so dreaded by peer and peasant; and, at the dawn of luckier days, the Magna Charta itself, were but words and sheepskin. The latter has long lost the high place of power, except in law and learning, as represented by certain documents and decrees; the parchment times are past, and at least better promises have come with the age of paper; but words are still, with us, mighty as they have been through all changes, since the tongues of men were confounded, and the darling project of the infant nations was given up for want of an interpreter. When Egypt was a Christian land, ages before either Turk or Saracen was known in history, the sect of Christian Platonists, which flourished chiefly at Alexandria, had among their philosophic questions—and curious ones were they went to agitate—this query: 'By which of all the distinguishing traits of mankind is the existence of the soul most clearly manifested?' The replies were numerous and very diverse. Some said it was by the cultivation of arts, others by the capability for abstract science; but one philosopher maintained it was principally by the use of words. Nor was his opinion without sound reason: much of our social intercourse, the whole fabric of literature, as well as the communication and diffusion of science, depend on the existence of articulate language.

How small a portion of our knowledge or thoughts can be communicated by sensible signs! The uninstructed deaf and dumb, small as their numbers are, and ought to be, in these days of institutions, could exemplify that fact. The art of delineation, in all its varieties, has in our age reached a perfection never before attained; and it is truly marvellous how much even an ordinary woodcut can be made to express, having, besides, this advantage over literature, that it is addressed to the understanding of the greater number; for he that looks may read. For these reasons, the earliest form of writing among nations who led the way to civilisation consisted of rough draughts or sketches of the scenes and things to which the writer referred: hence came the celebrated hieroglyphics of the Egyptians. That laborious people sculptured their history on pillar and pyramid, and painted their theology and ethics on the walls of their colossal temples, where learned travellers now gaze on figures of old forgotten idols, men in ancient costumes, strange animals, and utensils whose purpose is scarcely discoverable, and try to guess what story they were intended to convey.

The Chinese characters, every one of which represents an entire word, are believed to have had a similar origin; but elaborate and complex though it be, the writing of China is the improvement of centuries on the picture fashion.

Perhaps the most singular description of signs ever practised by any people was in use among the early Peruvians, who kept their records by means of knotted cords, each knot having to the mind of a Peruvian scholar a special signification, according to the mode in which it was fastened. All methods of symbolising must of necessity be meagre and limited. How much of the philosophy, the poetry, and even the history of human life, is there for which the tangible world furnishes us with neither sign nor representative! Hogarth, indeed, has given wit and wisdom to his canvas, and made it utter moral lessons to mankind: other great masters have painted for religion and for history; but art can never go beyond illustration, taking that current but significant term in the highest sense, and as such it has done the world good service.

Words, on the contrary, are nature's own sovereign gift to man—the music of his life, the channel of his thoughts, and the vehicle of his instruction; they alone resemble the soul, for by means of themselves we reason upon them: that power enabled the philosophers of former times to have much speculation and some quarrels touching the origin of their endless variety. Why the Frenchman should say *Dimanche*, and the Englishman *Sunday*, when both mean the very same thing, like sundry other whys and wherefores, remains an unsettled question, though it has been the subject of many a volume. One better known than the most of them, tells us that

God confounded the languages of men; and no matter how the passage be interpreted, its truth is at least practically evident, for the words of nations still differ farther than any matter about them. This was felt and mourned over, especially by the scholars of the seventeenth century, as a barrier to the accumulation of knowledge in individual minds, not to speak of its general increase among mankind, and their favourite desideratum was therefore a universal language. During the middle ages, Latin supplied that deficiency to the learned of all European nations; on which account, as well as because the crude remnants of literature and philosophy then preserved from the wrecks of the classic world were confined to its compass, a grammatical knowledge of Latin was styled 'humanity,' as if that branch of learning alone comprehended all that could raise or distinguish men above the inferior creation. There is reason to fear that the old schoolmen's ideas of humanity, as we use the word, were miserably circumscribed on all points; but the title with their meaning is still retained in our universities, and sounds strangely when we hear of the Professor of Humanity's fees. It is but an instance of the unaccountable change of signification which is apt to pass over the words of any language in a comparatively short space of time. About the days of Elizabeth, 'let' signified to 'hinder,' and a 'novel' meant 'a piece of startling intelligence.'

Thus entire tongues gradually alter as spoken by successive generations, though inhabiting the same country. The progress of refinement, the change of manners, and increased intercourse with foreigners, all contribute to their mutation or improvement. The English of our fathers is not ours in either pronunciation or orthography; and to a person of tolerable education in the present age, Wicliffe and Chaucer would be more difficult to read than Pascal or Klopstock in their original texts. Etymologists have taken considerable pains, and 'used up,' to naturalise an Americanism, much time in tracing out the roots and derivations of words: nor is the study without utility, as it occasionally throws light on the early history and affinities of nations, which, for the greater part, rest in the twilight of unrecorded times; but what Johnson said of his great work the *Lexicon*, occurs to an observer—'It is the drudgery of words.'

Connected with this subject, there was an early and very natural inquiry after the original language of mankind: the classic historians record an experiment made by one of the later kings of Egypt to ascertain it. He placed two infants with a dumb nurse on a solitary isle of the Red Sea, which he commanded no vessel to approach for the space of seven years, except one despatched by himself at intervals to supply provisions, and see that all were well, in hopes of hearing the primeval tongue spoken by those hermit children. At the end of the assigned period, the only word they could utter was found to be the Phrygian for bread; upon which the monarch decided that the tongue of the Phrygians was the oldest on the earth. The old Scottish chronicler commonly known as Pitscottie, mentions an imitation of the Egyptian king's experiment, as performed by James IV. The scene of his operations was an island in the Firth of Forth; and the chronicler naively winds up the tale by observing, 'Some say they spake good Ebrew; but as to myself, I know not, but by the author's report.'

A strange tribute to the power of words has been paid by the popular superstition of every land and race. The Indian on the western prairie, and the Nubian shepherd, alike believe in the mysterious efficacy of spell-words. In the most primitive legends of Asia and the earliest beliefs of western Europe, they occupy a no less important

station. Who has not heard or read some of those traditional tales, that have floated down through many a century and variation, regarding the fearful consequences of certain words uttered inadvertently in perilous vicinity, or forgotten at the moment of supernatural danger? In that old rustic faith, indeed, words seem to govern the spiritual world; and thereby hangs a piece of practical philosophy. Most vulgar errors are but shadows of substantial truth, vague and distorted, yet still reflections of the real. The Catholic peasant's confidence in the verse written on his scapular, as a defence against invisible powers, and the Jew's dread of a cabalistic sentence, are but natural inferences of superstition from the sway which mere words are found to exercise over the human mind; not to enlarge on those mighty effects produced by great orators from pulpit or platform, whence a single speech or sermon has sunk the balance of public opinion, and changed the councils of nations; nor those of volume or pamphlet, that have struck home to the heart of their times, from Don Quixote to Junius. What heart-burnings and hostilities have a few bitter words been known to create in every circle of society! Kings have been dethroned by a jest, wars have been kindled by one boastful sentence, and the bestowment of a nickname has been the seed of a politician's overthrow. The execution done by satires and lampoons is known to all readers of history or biography; nor can they fail to remark how large a share of the thorns and thistles produced by such sowings (and rarely have they a better harvest) has fallen to their authors.

The unwritten records of daily experience bear yet more ample testimony to our subject. Who that has survived life's early lessons, and learned to walk with his generation, cannot recollect many an instance of good neighbourhood interrupted, alliance broken off, and friendship changed into feud, by the same agents whose operation has been noted in higher quarters—a jest, a boast, or an ill-reported tale? Nay, in the silence of individual memory there lies weightier evidence: do not harsh and reproachful words return like perennial tares when the tongues that uttered them are dust? 'The evil that men say lives after them.' Do not the kind words of the long dead come back to make us miss them when things and times are changed? Will not old simple phrases, heard long ago by hearths that are, it may be, dark and distant, at once recall the past, with more of its light than shadow? Truly the tongue, though a small member, boasteth great things, and a greater than human wisdom has warned us to guard it. Words are indeed but the garments of thought, yet, like our personal costume, they exert an amazing influence on its appearance. A fine poem or essay is chiefly valuable for the ideas it contains; but were the very same expressed in inferior or ill-arranged language, they must lose half their power. Some words have a native music in themselves. Madame de Staël, though a foreigner, regarded the English words 'no more' as a sound unequalled in melancholy power.

It is strange to think how long the words may outlast the works of men. *Æsop's Fables* have survived for many a century the city in which he was a slave, and the sayings of the Seven Wise Men of Greece have outlasted all her temples. Our theme grows diffuse and boundless, for before us spread the wide fields of literature, with systems of philosophy, creeds, and controversies—the wordy wars and treasures of the world.

Letters are but words; yet are there any that have never watched and waited for some of them, even in these penny-postage times, and perhaps kept them in old drawers long after, till they read like false prophecy! Good advice is but words; but are there many who never gave, or never took it? He at least understood what was true who said that half the broils of life arose from the general habit of mankind, regarding their own words too little, and those of their neighbours too much. In the days of Lorenzo de Medicis, surnamed the Magnificent, when a contest between the Platonic and Aristotelian philosophers occupied all the leisure the Florentines could find from the feuds of the Guelph and Ghibbelines,

there arrived in their city a traveller, supposed to be of Greece. He was a learned man for the period, and being introduced to the philosophers, took an active part in their dispute, and one which was long remembered in Florence. At one of the great controversial meetings held under the special patronage of Lorenzo, he argued for the Platonists with such zeal and ability as to all but silence his opponents; and then at once intimating that much could be said on the other side of the question, he maintained the cause of the Aristotelians with no less vigour, and triumphantly refuted all his former arguments.

'How can you thus support two opposite opinions?' demanded the Magnificent Lorenzo.

'It is words, my lord—only words!' said the stranger with a low bow, as he left the astonished assembly. The parting speech of that unscrupulous logician is worthy of the world's remembrance, for the thousand cases in which its truth is manifest. What an amount of disappointment, discomfort, and division, not to speak of strife and all uncharitableness, would be spared to society and most of the members thereof by its practical application!

Perplexed and overburdened crowds, when an orator, who never lived for common sense or decency, talks to you of dying for the rights of man, remember that his patriotism is only words! Ladies, when lovers say you are angels, and they adore you, yet never act as if they thought you either rational or accountable beings, be assured that such professions are only words! Friends that have stood by and with each other through fortune's enmity in times that tried the strong, should quarrels come between you, as come they did between Pylades and Orestes, think how much of your dispute was nothing but words! And thou vassal of many tongues, when making the sacrifice of thine own peace, interest, or, it may be, purer feelings, to 'what people would say,' recollect that it is only words, like the present essay—less than the pope's letter to the Norman barons, and poorer far than sheepskin.

SKETCH OF SOME MEMBERS OF THE WASP FAMILY IN VAN DIEMEN'S LAND.

BY MRS CHARLES MEREDITH.

In the warm summer days, during our residence at Port Sorell, and more particularly in the evenings, we had often noticed a large kind of black fly darting in and out of the house with a loud sharp whizzing noise; and on a more attentive observation, we found a most tragic addition made to our list of antipodean contrarities—nothing less than the discovery of a savage and sanguinary war carried on by flies against spiders, and pursued with such vigour, that one would believe the Tasmanian flies were bent on avenging the tyrannies and grievances suffered at the hands of the spiders by the whole winged-insect family all the world over.

We had observed the forcible and noisy abduction of many an unlucky web-spinner, before I could satisfactorily make out what became of them, as the frequent seizures made, apparently by the same fly, forbade the conclusion of their being forthwith devoured; but by dint of sundry watchings and pursuits of the flies, and by eking out and piecing together my various small scraps of information and discovery, I at length acquired a tolerable knowledge of the habits and practices of my busy black neighbours. In size and shape they exactly resemble a large English wasp, but are wholly black, and possess formidable stings a quarter of an inch long. They build very remarkable cells or nests of earth, finely tempered, and formed in layers of tiny mud-pats, like a swallow's nest. Many of these were placed in a small wooden outhouse, between the upright studs and the boarding of the wall; several were formed on a

shelf in the porch, where some small pieces of wood lying heaped together offered convenient nooks; and one wasp, resolving to have a more costly lodgment than his friends, took possession of a meerschaum pipe-bowl which lay on the same shelf, and very snugly laid out his house in its interior. All the nests I have examined are arranged in the same manner, the whole fabric being from two to three inches long, and about one inch broad, or rather less; the external shape of the mansion, whether square, triangular, or pentagonal, depending a good deal on the site chosen. When completed, no aperture is left; but on being opened, three cells are almost invariably found, the two lesser ones each containing a gray, oval, chrysalis-shaped body; possibly a bag enclosing the eggs. The largest apartment is devoted to the purposes of a larder, and is always found full of spiders, of all varieties of size, colour, and kind, and closely and neatly packed together, with their legs all trussed up, so as to occupy the smallest possible space. The strangest part of the affair is, that the spiders are not dead, but remain perfectly soft and flexible in every part; and on being exposed to the sun and air, or stirred, a feeble movement is evident in them, as though they were paralysed or stupified in some manner, so as to be unresisting victims, and good fresh meat at the same time. The storehouse is thus well supplied, doubtless for the benefit of the chrysalis tenantry on their awakening to the knowledge of life and appetite.

I have rarely been more interested by any new insect than by these black wasps, ungentle and ferocious though they be; for there is a daring, dashing energy and brisk industry about their ways and doings that was very amusing, and perfectly original. The bee—dear little, hard-working, persevering fellow that he is—can still afford time for many a coquetish peep into blossoms and buds that he deigns not to taste; and even when arrived at home with his two pannier-baskets loaded with their heaped-up golden treasure, can stay for a few moments' friendly hovering to and fro, and pleasant exchanges of hum and buzz with his helpmate the ant, whose ways of thrift and industry even Solomon bids us to 'consider and be wise.' She never takes a straight road, but with a lump of plunder in her nippers, thrice her own size, runs hither and thither, up straws and round sticks, or maybe into a labyrinth of a violet root, where she plays at bo-peep with you for ten minutes before going forward again; and seems to get on in such a perversely roundabout way, that I have only been cured of my inclination to put her straight, by the conviction (after many trials, when anxiously striving to trace out the marauders of my bee-hives) of the utter hopelessness of such attempts. But the black wasp has none of these wandering weaknesses of character: solitary, stern, ruthless, and resolute he goes about his work of cell-building and spider-catching. If you chance to be near his chosen place of abode, you may see him dart past with a bit of mud or a victim; and a shrill sharp whizz—izz—izz is continued for some seconds or a minute, during the operation of packing away his load, when forth he darts again, straight and swift as an arrow, and the next moment very probably invades the peaceful retreat of some cobwebbed recluse, which, until now, safe from housemaids and brooms, has meshed and devoured his flies in comfort, but is at length seized and straightway trussed and packed up, half-alive, by the dark avenger.

The varieties of wasps, or wasp-like flies, which we noticed around Poystou (Port Sorell, V. D. L.) were very numerous. One is marked with alternate golden and black stripes, very similar to the English wasp, but more soft and downy-looking; another is red, long, and slender, with four long wings, and a prodigious sting, which it can protrude nearly half an inch from a kind of double sheath beneath the tail. Another species, partially red, frequented the sandy paths of the garden, where several of them were generally seen darting

along, flying straight up and down the walks. I have sometimes followed them nearly round the garden without their ever quitting the path, or rising more than a foot from the surface. Sometimes I have observed them stop at a hole in the sand, apparently their nest, and after poking down into it, head-foremost and tail up, for a minute or more, they made a great skurry of dust over the opening, so as entirely to conceal it, and flew on again.

Without enumerating many other members of this family, of whom I know little more than their outward aspect, I shall mention one more, which has interested me nearly as much as the architect-wasp first described, and has caused me to waste infinitely more time in vain attempts to pry more nearly into its domestic privacy. At the cottage we first occupied at Port Sorell, I was annoyed to find that the multiflora rose-trees which adorned the veranda had, towards autumn, become quite disfigured, by having large rounded pieces scooped out of nearly every leaf; five or six great scoops being made in each, leaving the middle fibre entire. First I attributed the mischief to caterpillars, and then to grasshoppers; but never found any on the trees. At length the frequent buzzing of a large bee-like fly attracted my attention; and on watching its movements, I detected it in the very act of snipping out a piece of rose-leaf, rolling it up, and grasping it in its legs, and flying off. After this, I observed the work going on in the same manner daily for some time. Plants, raised from cuttings of these same rose-trees, grew around the porch of Poystou, and these were used by the same busy workmen in the same manner, besides other kinds of rose-trees, and the leaves of the cherry, acacia, and other trees. This wasp has a pair of forceps, acting precisely like scissors; and very many times I have closely observed him snipping out, with a quick clean cut, the piece of leaf, which is usually about the third of an inch broad and long; about six or eight seconds suffices for the cutting, when the piece of leaf is most nimbly and adroitly rolled up, and clasped by the feet and legs, as the wasp flies away. I have frequently started off when the wasps flew away, and given chase to them, hoping to find out whither all the leaves were carried, and how they were used; but the depredators always proved too clever for me, and glanced out of sight, leaving me to come panting back again, vainly vowing to be more agile and sharp-sighted next time. Having often found these same insects busy gathering honey, I imagined they had a hoard or nest somewhere near, but never found one. An intelligent young person, who lived with me at this time as nursery governess, told me she had often found the nests, which were holes in the ground, filled with bits of leaves, in which small portions of some sticky sweet stuff, like honey, were folded up and stuck together, only one or two wasps seeming to inhabit each hole. This species, like all my other acquaintances of the wasp kind here, has a long sting, and precisely the head and antennæ of the English insect.

A totally different species from any of these frequented the wide sandy sea beaches at Port Sorell; these latter were large, bulky, formidable insects, with great stings like the others, and were often seen on a warm day darting about in twos and threes, just above the surface of the sand. One of them would sometimes hover over the same spot for a minute or two, when another would suddenly dart to the place, and the first wasp instantly took up his station at some distance, hovering as before, until he either displaced another or was superseded in his turn; and the same dance of 'change sides and back again' went on as long as we watched them; but what they were doing, or how they got their living, remained an undiscoverable mystery to me.

It is only just to all these long-stinged wasps to add, that neither we, nor our children, nor servants, were ever stung by any of the fraternity, although we frequently chased and captured them for examination; but

always with a due dread of their threatening weapons of defence, and a careful restoration of their liberty when our curiosity was satisfied.

A STORY OF OLD VERSAILLES.

In the latter days of Louis XIV., the favour of *Le Grand Monarque*, or that of Madame de Maintenon, formed the chief dependence of a large portion of his subjects; and numbers of the needy branches of nobility crowded to Versailles in search of patronage and places. Among the thousands who resorted to that temporary metropolis of fashion and royalty, came Monsieur de Theminay, a gentleman of Languedoc, whose extraordinary conduct furnished matter of surprise and remark to all who knew him, at least for the first six months of his residence. He was allied by birth and marriage to some of the most powerful families in the kingdom; possessed of what were called tolerable talents, a cultivated taste, engaging manners, and an estate which just supplied a sort of contracted competence for himself, two grown-up sons, and a daughter. His sons were esteemed promising young men, and some people thought his daughter a beauty; yet with all these motives and appliances for advancing his fortune, M. de Theminay never attended a levee, never manoeuvred for an office, nor sought the favour of either mistress or minister.

M. de Theminay's friends wondered how he intended to provide for his family. Some of them hinted that he was by no means in the way of his duty; but at last it transpired that their prospects had not been so entirely neglected as people imagined—the father having looked to some purpose up the long vista of matrimony on behalf of two of his children, and it was supposed that he trusted in his good fortune to arrange matters similarly for the third. He himself had made two consecutive trials of the blessed state: the first was with a lady of the noble house of Castelaïne, who died early, leaving him a son and daughter; and the second with the daughter of a Languedoc farmer, whose memory he rarely recalled among his friends, for the lady had followed her predecessor in a few years. But she left him a second son; and as the three grew up around his advancing age, M. de Theminay established his family in Versailles.

There he kept a small corner house, quietly respectable in its appearance, and fewer servants than were then thought necessary for a man of his rank; but M. de Theminay said he despised ostentation, and came only to enjoy select society, and complete the education of his children: to which the said society added, that his chief object was to cultivate the good graces of his rich cousins the Faquettes, who resided in a more expensive quarter of the town.

The father of this family had been a farmer-general, who grew rich and resigned his office amid sundry whispers of speculation. The mother was a West Indian heiress, who had been sent from Martinique when very young to De Theminay's brother-in-law, the Abbé Castelaïne, and nobody thought of inquiring further into her birth and parentage. Their only son and daughter inherited a double portion of her West Indian complexion, and a mediocrity of mind which qualified them in all respects for making the poorest possible figure in their age and station. These were deficiencies which even riches could not entirely cover. The family found their footing insecure in the highways of fashion, and the guests of their balls and suppers called them the poor Faquettes.

With the De Theminays, on the contrary, nature had dealt handsomely. The first madame's children, Auguste and Valerie, were as like each other as brother and sister could be. Tall, finely moulded, and graceful, each had the same distinguished air and dignified yet pleasing address. Valerie was naturally esteemed the most beautiful: she was just nineteen, and her brother twenty-one. In their characters there was also a strong resemblance: both were generous and enthusiastic, sensitive, high-spirited, and somewhat imperious; but the latter defect was overlooked, in consideration of the world of small talents which they shared between them.

M. de Theminay was proud of his two elder children, and they were no less so of each other; which, combined with their similarity of disposition, made them closer and more confidential companions than brother and sister usually were in the courtly town of Versailles; and as both piqued themselves on being descended from the noble house of Castelaïne, they had learned from infancy to look with a sort of exclusiveness on their younger brother, of whom M. de Theminay was not in the least proud. His mother had got her own way for once, in calling him by the old peasant name of Justin; and he had grown up neither beautiful nor plain, but a thoughtful, manly-looking youth of sixteen, whose time was spent between the city streets and the Cordeliers' seminary for young gentlemen, where, as his father remarked, he might remain till something turned up.

For the senior two, the old gentleman had long since turned up something in earnest. 'Auguste will marry Claire, and Valerie Jean Faquette,' had been his early consolation. 'The creatures will have large fortunes, and these must not be lost to the family.' Such thoughts were imparted, though in very different words, to the retired farmer-general; and as the shine was all with the De Theminays, and the solids all with the Faquettes, the latter gradually entertained the proposal till it came to be regarded as a settled arrangement. Dissenters were, however, found in the parties most concerned. Auguste and Valerie had what their father called a singular prejudice against mercenary matches, and early discovered that there was no congeniality of taste or feeling between them and their cousins, whom everybody voted dull and uninteresting; but M. de Theminay was accustomed to take his ease in life's inn. The matrimonial scheme was therefore understood rather than expressed; and as the brilliant brother and sister had no objection to patronising and being admired in a quiet way by the Faquettes, who looked up to them as chiefs of their line, he read the papers, played chess, and went from *soirée* to theatre, putting his trust in time to teach his boy and girl the value of *louis-d'ors*.

A year had thus passed when M. de Theminay found out that his family hairdresser was too old for business; and Madame Faquette recommended another, an honest skilful Gascon, who, with his wife and daughter, had lately come from Paris, where trade was not so good as it had been. His abilities were tested for the first time on the night in which all Versailles crowded to the Théâtre du Roi, to see the new tragedy of Florimer d'Avignon, such being the fashionable designation of an author who promised to become the 'lion' of the season. The tragedy was successful, as a tragedy could be only under the Grand Monarque. It was called 'Semiramis,' remote classical subjects being then in favour; and exhibited such sayings and doings of that ancient princess as occasioned weeping in the galleries, fainting in the pit, and sent half the ladies in the boxes off in violent hysterics. The curtain fell amidst thunders of applause, which were followed by shouts for the author, whom the manager, in self-defence, was obliged to point out where he sat in a stage-box. An immediate rush was made towards it by some enthusiastic spirits, in order to crown him *à la Voltaire*; but the attempt was unseconded, an old poet having suggested the propriety of waiting for another tragedy.

The author rose to make the customary acknowledgments; and Valerie, as she waved a handkerchief damp with tears and extract of roses, saw a small slender youth, who might have passed for a monk of La Trappe, his face was so pale, spare, and melancholy, but for a pair of brilliant eyes and an expensively-laced waistcoat. Valerie could not hear his words, but she caught the young poet's eye, and half her friends told her afterwards in confidence that they could not help thinking the speech addressed to herself.

Auguste and she were moving slowly to their carriage through the noisy crowd of the emptying theatre, with monsieur and Justin close behind them, when a thin brownish hand was thrust through the moving mass with a small billet, which the latter took and quietly de-

posited in his pocket. The transaction was so rapid that it escaped the father's eyes, though not those of Auguste, who chanced to look back; but the next moment his attention was arrested by a faint scream in the opposite direction, and pressing forward, they found a young girl stretching her arms in vain to some one from whom she had been parted in the throng, while a large town porter made his footing sure on her muslin robe, and a whole squadron of chairmen pushed past her in haste to pick up fares. A word from the laced and sword-wearing nobleman was sufficient to make the porter change his position and the chairmen pause; while a man, calling for his dear Ambrosine, made his way back, and drew the girl's arm once more within his own: it was the Gascon hairdresser, and loud was his gratitude to the young gentleman for troubling himself about his poor girl. She was his only child, was never used to such places; but she loved poetry and plays, and he had brought her to see the new tragedy. The girl seemed almost a child as she clung to her father's arm, small, round, and rosy, a gem of a brunette, and dressed with a simplicity and elegance rarely adopted by the taste of her class. The De Theminays gave the father and daughter the benefit of their company till fairly out of the precincts of the theatre, and then sent them on their homeward way, proud and happy with kind words and good advices. Auguste handed his sister to the carriage, but his last look was cast on the retreating figure of Ambrosine.

From that night the brother and sister had other things to think of besides their dark-coloured cousins. Valerie was introduced to the poet at a *conversazione* on the following evening, and they talked together half an hour on the Scudery romances. He was somewhat eccentric in manners, said to be the last of a noble but far-reduced family, who had left him nothing but their name, and a romantic disregard for everything but love and fame. These peculiarities secured the popularity his tragedy had won. The ennuied world of Versailles were delighted with the freshness of that earnest mind; nothing so new had been seen for a considerable time, and patronage, friends, and flatteries poured in from all sides on the favourite of the hour. Flirtation was never considered proper for any but married ladies in France, so Valerie did not flirt; but her days were thenceforth spent in reading the poets from Homer downwards, and her evenings in listening to Florimer d'Avignon. The poet was not insensible to so much attraction and taste; his appreciation of both was shown in a thousand small but flattering ways. He addressed the greater part of his conversation and a brilliant copy of verses to the lady. Valerie treasured the latter in her jewel-drawer, and never forgot that somebody said they had been made for each other. There were other circumstances which threatened the paternal plans still more: Auguste's attentions to his cousin had never been very pointed, but of late their falling off was manifest, and a singular change had come over the habits of the young man. He who everybody said, and himself believed, was formed to shine in society, grew careless of balls and heedless of *soirées*; besides, he began to talk in a depreciating tone of the advantages of birth and fortune; spoke mysteriously of noble qualities concealed by an inferior station, and a wealth of soul which the world never knew. Valerie wondered at all this; but one day finding her brother had forgotten to lock his *escritoire*, she peeped in, as sisters will do, and found a small letter addressed to Auguste in a fine female hand. The opportunity was irresistible, and Valerie read. It was an answering epistle, full of most tender sentiments beautifully expressed, and signed with the name of Ambrosine Dupré. Could a hairdresser's daughter so think and write? The rest of the secret was soon reached. Auguste told her how he had been struck by the young girl's simple beauty at the theatre on that crowded night; how he had seen her afterwards on the street, and at the windows; and at length sent her a bouquet, for which he received a billet of thanks, revealing at once an education far above her rank, and talents rare in any station. Some letters and many interviews had passed between them since then; in short, Auguste was desperately in

love. He described her modesty, her candour, and her affection for him, till Valerie herself was charmed, especially with the letters which he bade her read, that she might see the heart and soul of his Ambroisine; adding that their personal interviews, however delightful, were hardly as yet as satisfactory, since a profound sensibility kept the girl almost silent in his presence.

That was a moment of mutual outpouring: Auguste admired the poet, and Valerie promised to befriend his Ambroisine. While the brother and sister thus freely discussed their own affairs, they were equally puzzled over those of another. Who had given Justin that billet at the theatre?—and what did it contain? The boy had evidently a secret of his own; they had heard of him being seen in the suburbs of the town at extraordinary hours; few of his evenings were passed at home, though the worthy Cordelier occasionally lamented that he was too much attached to his father's house. Auguste and Valerie were above prying; their younger brother was half a stranger to them; but they felt themselves called upon to watch over his youth for the honour of the family.

Doubtless it was for similar reasons that other eyes soon began to take cognisance of their proceedings. As the poet's partiality for Valerie grew more expressive, and Auguste's visits to the hairdresser's more frequent, suspicions crept into the mind of M. de Theminay, and the Faquettes put on the looks of ill-used people. The old gentleman of course set himself to observe, and discoveries more true than pleasing rewarded his vigilance; piece by piece the whole story came out, and the consequence was, an explosion of wrath never before heard in the quiet house of the Theminays.

About this period Versailles found a new subject of conversation, in a woman who had lately taken up her abode in one of those suburban cottages remaining since the place was a village with straggling hamlets round it in the wide plain. She was known as Madame Le Sage, and her ostensible profession was that of a letter-writer; a vocation still very common in France, but then particularly rare in the hands of women. Madame Le Sage was, however, esteemed the mistress of her art, and with the fame of her epistolary accomplishments were bound up matters far more attractive to public curiosity. Her letters were said to be lucky; some insisted that none of them ever missed their object, and instances were whispered about of families of the first distinction who employed her pen under that impression. Madame Le Sage, besides, could afford information on futurity. The faith in fortune-telling was a characteristic of that otherwise doubting age; it prevailed among the best-educated ranks, and sceptical philosophers were not free from it. The ordinary practice was forbidden by the French laws; but madame's mode consisted in a kind of lottery, in which the parties drew for themselves; and marvellous tales were soon afloat regarding the truth of her revelations.

There were personal wonders too; the lady came last from Paris, but nobody knew anything of her previous history. She had the face of a Jewess, with a dark complexion, and almost dwarfish stature; though apparently not older than thirty, her hair was perfectly white, and she wore it combed down straight to her waist, but secured by a thin silver band across the forehead; she was deficient in a hand, and some said in a foot also, for she walked with a silver-headed cane, and wore a very long brown dress, with loose hanging sleeves, in the Oriental fashion; rarely leaving the solitary cottage where she lived with her only attendant, an elderly woman, large and gaunt in person, and blunt to a degree of surliness in her manner. The pair soon furnished half the gossip of the place. Their cottage was visited by persons of all ranks. It was whispered that Madame Maintenon had gone there to ask about the king's death, and the dauphiness to inquire after madame's dismissal; but more than two were never admitted together on any pretext; and such was the effect produced by the elder dame who acted as portress, that the most unruly of the young nobility did not dare infringe the order. Scandal never emanated from that quarter; but a total change of conduct was

remarked in many of the visitors; and those who went with the most careless curiosity, were ever after apt to look grave when the subject was mentioned.

It was the season of the Carnival, and that festival was in those days celebrated in Versailles with almost Italian extravagance. By way of instalment for the strict Lent which followed, merriment and masquerading were the order of the day; and the evening concluded with a public masqued ball at the palace, and an entertainment given by either master or servants at every second house in the city; but M. de Theminay's stood quiet and dark. He had given his servants leave to spend the evening with their friends, and gone with his whole family to partake of the festivities at the palace. Some two hours had passed, and those who saw the old dervise (Theminay always thought that character convenient) spying among the satin-clothed shepherdesses and bowing satyrs who thronged the splendid saloons, knew as little as himself that the son and daughter of whom he was in search had taken the opportunity to put in execution a design agreed on that very morning, and were then, with the addition of masks and black dominoes, on their way to Madame Le Sage.

The cottage stood alone in an old vineyard—now within the liberties of the town—and at the end of a lane inhabited by Jews and pawnbrokers. It was low, but strongly built of black oak timber, and it had stood since the wars of the League. The hearts of the brother and sister were almost as audible as their knock. They did not absolutely believe in madame's lottery, but they were about to inquire for themselves; and even an imaginary glance at the future has something of fearful interest. The massive door was noiselessly opened, just sufficient to show the grim portress with a lamp in her hand. Auguste presented the well-known fee, and whispered that they wished to see madame. The dame admitted them without a word, locked the door, pocketed the key, and made them a sign to follow her through a narrow passage, which seemed to run the whole length of the cottage, as there was a window still open at the farther end, and three fast shut doors on each side. At the middle one on the right their conductress paused, and opening it with another key from her evidently well-furnished pocket, she growled—'There is madame in her office.'

It was a small room paved with coloured tiles in old rustic fashion; the furniture was simple; and in the centre, nearly under a brass lamp which hung from the ceiling, sat that wondrous woman, exactly as they had heard her described, with the brown dress, long white hair, and dark Oriental face; her one arm, covered by a sleeve far beyond where the fingers should have been, rested on her lap, and the other hand on a plain writing-table before her, containing the only professional apparatus to be seen, except a huge old-fashioned cabinet of walnut wood close by, on which an illuminated manuscript lay open over two projecting drawers. One of these was distinguished by some inscription on a brass label; and the other was ornamented with a brazen hand in the act of writing.

'Your business?' said the lady, looking up carelessly as they entered. Auguste again deposited the fees, and intimated that they had come to consult the lottery.

'Hand me down that volume then,' said she, pointing to the manuscript. Auguste did so: it was large, and the characters, though Roman, seemed old and quaint.

'Which will draw first?' inquired madame as she turned over the leaves.

'I,' said Valerie, whose courage was now up.

'There are three questions,' continued madame in the same grave and business-like tone; 'and I may as well observe, that the truth of your drawing depends on that of your answers. What are the day and year of your birth? To what rank do you belong? And what is your religion?'

Valerie replied; and madame wrote her answers slowly on a small slip of paper: then handing her another, she said, 'Write here what you wish to inquire at the cards, and remember you can ask but three questions at once.'

With as firm fingers as she could command, Valerie

wrote, 'Will my lover be fortunate in life? Shall I ever be united to him? And will it be with my father's consent?'

Madame glanced over it to see that all was right, and then folding up the papers together, she said, 'Place them in the drawer of the brazen hand.' Valerie dropped them in: the drawer was unlocked and empty. 'Lock it,' said madame, handing her the key. 'Your number is eight, according to your birthday; you must therefore wait eight minutes,' pointing to a small chronometer on the table, and she immediately began to read aloud from the manuscript. It was a strange tongue, but Auguste afterwards said that he believed it to have been the old Provençal language. Now in prose, now in rhyme, the lady read; and the listeners thought that, in the pauses, they could hear a low rustling sound, as if of lightly-moved papers within the cabinet. Never were eight minutes so long in passing as those to Valerie; but the hand of the chronometer measured them out at last, and madame, like one who had finished a troublesome task, laid down the manuscript, and making a gesture to the other drawer, said, 'Pull it out—it needs no key—and take the three cards that have edged up, for they are your own.'

Valerie pulled out the drawer. It was covered in, all but a small space in the centre, in which a bundle of cards, about the size of an ordinary pack, was inserted, with the edges uppermost. Three of them stood about half an inch above the rest, and these Valerie drew out under the eye of madame, who commanded her instantly to close the drawer, and then proceeded in the same fashion with Auguste.

The business was done almost as quickly as it could be told. Madame bade them good-night, and the door-keeping dame showed them out in the style of their entrance. Valerie thought she heard something ring sharply on the tile floor as they left the passage, but her watch was still in its place, and other cares on her mind.

The brother and sister had mutually remarked the perplexity of each other's face while they read their cards by the brazen lamp, but Auguste was the first to break silence.

'Were the cards propitious, Valerie?' said he.

'Why, yes; it seems so. But there's something strange,' whispered his sister.

'Strange enough,' he resumed. 'Let us compare notes. My questions were, as you know, similar to yours; every card has answered one of them in a sort of affirmative; but, Valerie, it is with sentences from Ambroisine's letters. I know them well, having read and admired them a thousand times.'

'Brother,' interrupted Valerie, 'every question of mine has been answered with a verse of those Florimer addressed to me: judge if I could mistake them!'

The pair wondered and surmised the long way home. No one had yet returned; but just as Auguste produced his key, Valerie exclaimed, 'I have lost my mother's miniature!'

The girl referred to a rich locket, set with brilliants, containing a portrait of her dead mother, by whom it had been hung round her neck, with a fond injunction to wear it for her sake.

'It was that I heard fall,' she continued, 'when leaving the cottage. Brother, we will go back. I would not lose it for half the jewels in Versailles—in such a place too.'

Auguste murmured something about searching the sea; but back they went. The night was by this time well advanced, and the principal thoroughfares began to be thronged with the returning revellers. Auguste recollected that there was a quieter way which he believed led to the cottage. It lay through back lanes and wynds, where congregated the offscourings of society, which Versailles had won from Paris with court and fashion. It was up one dark narrow street and down another with them, till at length they unexpectedly emerged from the dirtiest wynd of all at the very back of the cottage.

There was no light to be seen but one slender quivering ray which glanced from the nearest window. On approaching, they guessed it to be that of the passage; but

all beyond was dark. There were sounds of merriment within, too, that rose and fell upon the gusty night. An accidental push informed Valerie that the window was unfastened.

'I will go in, sister,' said Auguste, half wild with curiosity; and almost with the words he pushed back the narrow sash, which opened, in the French manner, like a door, and stepped lightly over the sill. The fear of remaining alone outside, and a boundless anxiety to know what was going forward, made Valerie follow him with surprising silence and rapidity. Her hand came in contact with the handle of a door on one side of the passage, from which the sounds came more distinctly. They were bursts of shrill laughter, intermingled with grave and angry tones, which seemed familiar to their ears. At the loudest peal Valerie turned the handle, the door opened, and both glided into an apartment half lighted from another door in the corner, which stood some inches open. The brother and sister approached, and held their breath. The shadow of that huge cabinet partly concealed the aperture, for they looked into madame's office. There sat the lady herself, still under the brazen lamp; but the fillet of silver and long silvery hair were gone, leaving only a close black crop. The writing-table had given place to one occupied with the remains of a supper, and opposite her sat their own brother Justin! There was a bundle of letters in his hand, and Auguste's look grew black as it caught the back of the uppermost. 'So,' said Justin, continuing his conversation, while the Theminays stood within two yards of him, 'the letters you wrote for the hairdresser's daughter were to my brother, and you never told me, friends as we have been?'

'What end would it serve, my dear!' said madame, apparently much amused: 'if one would mind everybody's relations in this world, business could never go on; and you know there might have been kinder relations than the branches of Castelaïne.'

'But,' said Justin, 'Auguste has been terribly deceived.'

'Yes, by his silly vanity!' interrupted madame. 'What else could have made him imagine that the girl who listened to him like an oracle, and sat silent and simpering in his presence, could ever comprehend one word or thought of such letters? Vanity, my dear fellow, believe me, is the root and foundation of full two-thirds of all the world calls romantic attachments. It was the self-same thing that made his sister—I forget the girl's name—fall in love with Riviere's son, when he turned out a great poet, and wrote verses to her as well as for my cards.' I wish he and his mother had finished their carnival—they always like to keep it in their old way. Poor soul, how drunk she will be to-night! But it is well the knocking hour is past, since there are two of us here.'

'And what matter?' cried Justin in rising wrath.

'Oh,' said the lady, 'there was a Jew at Presburg who knew the Cabala, and showed me that four was my unlucky number, so I shouldn't like the admission of two; and none care to come singly, you know. I wish the Theminays had this trinket back,' she continued, pulling out of her wide sleeve the very miniature of which Valerie was on search; 'they will miss it, but it is best to dispose of those letters.'

'They are mine!' shouted Auguste, bounding into the very centre of the room; at the same moment madame made a snatch, which told of no lameness, at the lamp. It was extinguished in an instant, leaving all in utter darkness. They heard the slamming of doors, and the sound of retreating footsteps. Valerie had followed, and grasped her brother's hand in the gloom; but terror came over them both, and they made for the open window. Their exit was still quicker than their entrance; and knowing that nothing more could be done, the brother and sister hurried home. They reached the house worn out and splashed with mud. M. de Theminay had returned, and the whole household were alarmed at their absence. The servants did their best, but they could not catch a word of the explanation, which was given with closed doors; and early next morning Auguste returned to the cottage accompanied by a police-officer.

They found it open and deserted: the furniture, including that huge cabinet, was still there; but the lamp, the brasses of the mysterious drawers, the cards, and every scrap of written paper were gone.

Auguste examined the cabinet curiously. The interior was like a small closet, with a few drawers at the top strangely supplied with slits and sliding divisions; and in the first he opened lay Valerie's locket. That cabinet eventually passed into the hands of the prefect of police, who soon after became remarkably inquisitive regarding the whereabouts of Madame Le Sage and her portress; but neither ever appeared within his jurisdiction.

Among the many explanations of the wonder-working lottery offered on the occasion, it was conjectured that Madame Le Sage had been in the habit of keeping a person concealed in the cabinet for the purpose of arranging the cards according to her directions, which she gave in a mutually-known language while pretending to read from the manuscript. Certain it was that her extended business as a letter-writer must have made madame acquainted with family and individual secrets, which she seemed to have taken an unaccountable pleasure in revealing by means of her cards to the parties from whom they were most anxiously kept, and to that circumstance alone much of her power was owing.

After her departure, the poet was never seen in Versailles; his admirers said he had retired from society in disgust; but a well-known scholar subsequently recognised 'Semiramis' in an antiquated Italian tragedy. The utmost efforts of the police, and the inquiries of the many interested, failed to throw any light on the past history of the trio whom public rumour gradually connected, except that three persons answering to their description had formerly resided at Avignon, in the house of an old Jewish rabbi some years deceased, and supposed to have come originally from Rome. The same party was afterwards traced through many of the great towns of Europe in a variety of nondescript professions, to which, however, fortune-telling in some shape was always united.

The most extraordinary part of the affair as regarded the Theminays was Justin's connection with it. How the solitary and neglected boy had made such an acquaintance as Madame Le Sage, or what part he took in her affairs, was never exactly ascertained by either Auguste or Valerie. Justin could not be found for weeks and months from that eventful night: the search and inquiries of his family were equally fruitless, till at length one day his Cordelier instructor made a private communication to M. de Theminay, the reported substance of which was that the boy had joined their order in a Breton monastery; and monsieur observed, when speaking of the subject, that his son had always a religious tendency. The old gentleman was still better pleased when, as time wore away, bearing with it the reports and impressions of those events, his son and daughter rapidly renewed acquaintance with their wealthy cousins; and a few days before the following Carnival, the double wedding was celebrated with great splendour, to the delight of all parties. The duties of his profession were fulfilled on that occasion with more than ordinary elegance by Ambroisine's father, who remarked that his poor girl was also about to be married to the man of her choice, and his own apprentice.

REMAINS OF NINEVEH.*

It seems to be the privilege of our age, not merely to produce the most extraordinary amount of interesting history itself, but to effect the recovery of some of the most remarkable, though heretofore lost, passages of ancient history. We have already seen the early events of some of the great extinct monarchies of the East read off from monuments and inscriptions, and one or two

thousand years thus added to the entire history of mankind. Now another, and perhaps the greatest of these primitive states is, as it were, raised from the grave, and made to tell its own story. The vale of the Tigris, one of the most fertile spots of the earth, is, as is well known, now occupied only by a scattered Arabian population under the Turkish government. Travellers have made known to us the existence of great mounds in several places—the supposed ruins of the ancient Assyrian cities and palaces; but this was mere conjecture. Not a single building existed which could be referred to the ancient empire. The very site of Nineveh, which Jonah saw a city of three days' journey in circuit, was uncertain. So early as the days of Xenophon, desolation and barbarism had resumed their reign over this once magnificent country. At the same time, scarcely any authentic memorials had come down to us of Assyrian history: we knew little but that there had once been a great empire in this valley; that it had personages called Ninus, Semiramis, and Belus connected with it, and had sunk under the Persian empire, while kings were still reigning over the infant city of Rome. It was reserved for British enterprise, within the last four years, to turn the darkness which had settled on this subject into something like light.

The present work gives an account of the arduous task which Mr Layard was induced to undertake in 1845, of exploring the great mounds under which the ruins of Assyria were supposed to be buried. He at first acted on his own responsibility; but when some success had been attained, the countenance and assistance of the government were extended to him. Still, at all times he had to contend with great difficulties, the chief of which lay in the barbarism of the native government and its subjects, one-half of whom are the plunderers of the rest. His first work was the trenching of the great mound called Nimroud, situated on the tongue of land formed by the junction of the Zab with the Tigris. To his great delight he found the walls of a series of palaces, containing huge idols, sculptures in bas-relief and paintings, and many minor objects, helping to throw a light upon the history as well as manners of the Assyrians. It was an astounding resurrection, bringing things before the gaze of mankind which had been covered over and thrown into utter oblivion before the days of Alexander. Afterwards Mr Layard effected similar excavations at Kalah Sherghat, a place farther down the river, and on the west bank; likewise at Kouyunjik, near Mosul. Meanwhile similar works had been proceeding, but on a less happy method, at Khorsabad, under the care of a French consul. Mr Layard at length determined that the ancient Nineveh had stood on the left or east bank of the Tigris, one side of it bordering on the river between Kouyunjik and Nimroud, while the other lay between Khorsabad and Karamles, a sort of lozenge-formed square of about sixty miles in entire circuit. The ruins at these places were but the remains of the principal public buildings; the rest of the city had left no memorial above the general level of the soil. Ultimately, Mr Layard succeeded in shipping off some of the principal remains to England, for the British Museum; and it has since been the employment of his leisure to compose a narrative of the whole proceedings, as well as a view of ancient Assyria, as now revealed to us by the result of his labours. Of the book we must pronounce that it is as creditable to his taste and intelligence, as the excavations were to his courage and diplomatic skill. It is amply illustrated with drawings and plans.

The most striking objects exhumed by Mr Layard were colossal figures of bulls, with wings and human heads, or else lions similarly furnished, which stood beside the portals of the palaces; realisations, no doubt, of some of the leading religious or moral ideas of the Assyrians. Some of these have been sent home. Slabs, with bas-reliefs and inscriptions in cuneiform letters, rank next in importance. They present kings in battle, or returning from it; sieges and captures of cities; horse-

* Nineveh and its Remains, with an Account of a Visit to the Chaldean Christians of Kurdistan, and the Yezidis or Devil Worshipers; and an Inquiry into the Manners and Arts of the Ancient Assyrians. By Austen Henry Layard, Esq. D. C. L. 2 vols. London: Murray. 1849.

men pursuing one another; and so forth; all in a rich and not incorrect style of art, though wanting the grouping and expression given by the modern sculptor. But let Mr Layard himself give a general description of Nimroud, as it appeared when the excavations were about to cease:—'We descend about twenty feet, and suddenly find ourselves between a pair of colossal lions, winged and human-headed, forming a portal. I have already described my feelings when gazing for the first time on these majestic figures. Those of the reader would probably be the same, particularly if accompanied by the reflection, that before those wonderful forms Ezekiel, Jonah, and others of the prophets stood, and Sennacherib bowed; that even the patriarch Abraham himself may possibly have looked upon them.'

'In the subterranean labyrinth which we have reached, all is bustle and confusion. Arabs are running about in different directions; some bearing baskets filled with earth, others carrying the water-jars to their companions. The Chaldeans or Tiyari, in their striped dresses and curious conical caps, are digging with picks into the tenacious earth, raising a dense cloud of fine dust at every stroke. The wild strains of Kurdish music may be heard occasionally issuing from some distant part of the ruins; and if they are caught by the parties at work, the Arabs join their voices in chorus, raise the war-cry, and labour with renewed energy. Leaving behind us a small chamber, in which the sculptures are distinguished by a want of finish in the execution, and considerable rudeness in the design of the ornaments, we issue from between the winged lions, and enter the remains of the principal hall. On both sides of us are sculptured gigantic winged figures; some with the heads of eagles, others entirely human, and carrying mysterious symbols in their hands. To the left is another portal, also formed by winged lions. One of them has, however, fallen across the entrance, and there is just room to creep beneath it. Beyond this portal is a winged figure, and two slabs with bas-reliefs; but they have been so much injured that we can scarcely trace the subject upon them. Further on there are no traces of wall, although a deep trench has been opened. The opposite side of the hall has also disappeared, and we only see a high wall of earth. On examining it attentively, we can detect the marks of masonry; and we soon find that it is a solid structure built of bricks of unbaked clay, now of the same colour as the surrounding soil, and scarcely to be distinguished from it.'

'The slabs of alabaster, fallen from their original position, have, however, been raised; and we tread in the midst of a maze of small bas-reliefs, representing chariots, horsemen, battles, and sieges. Perhaps the workmen are about to raise a slab for the first time; and we watch with eager curiosity what new event of Assyrian history, or what unknown custom or religious ceremony, may be illustrated by the sculpture beneath.'

'Having walked about one hundred feet amongst these scattered monuments of ancient history and art, we reach another doorway, formed by gigantic winged bulls in yellow limestone. One is still entire; but its companion has fallen, and is broken into several pieces: the great human head is at our feet.'

'We pass on without turning into the part of the building to which this portal leads. Beyond it we see another winged figure, holding a graceful flower in its hand, and apparently presenting it as an offering to the winged bull. Adjoining this sculpture we find eight fine bas-reliefs. There is the king hunting, and triumphing over the lion and wild bull; and the siege of the castle, with the battering-ram. We have now reached the end of the hall, and find before us an elaborate and beautiful sculpture, representing two kings standing beneath the emblem of the supreme deity, and attended by winged figures. Between them is the sacred tree. In front of this bas-relief is the great stone platform, upon which, in days of old, may have been placed the throne of the Assyrian monarch, when he received his captive enemies or his courtiers.'

'To the left of us is a fourth outlet from the hall, formed by another pair of lions. We issue from between them, and find ourselves on the edge of a deep ravine, to the north of which rises, high above us, the lofty pyramid. Figures of captives bearing objects of tribute—ear-rings, bracelets, and monkeys—may be seen on walls near this ravine; and two enormous bulls, and two winged figures above fourteen feet high, are lying on its very edge.'

'As the ravine bounds the ruins on this side, we must return to the yellow bulls. Passing through the entrance formed by them, we enter a large chamber surrounded by eagle-headed figures. At one end of it is a doorway guarded by two priests or divinities, and in the centre another portal with winged bulls. Whichever way we turn, we find ourselves in the midst of a nest of rooms; and without an acquaintance with the intricacies of the place, we should soon lose ourselves in this labyrinth. The accumulated rubbish being generally left in the centre of the chambers, the whole excavation consists of a number of narrow passages, panelled on one side with slabs of alabaster, and shut in on the other by a high wall of earth, half buried, in which may here and there be seen a broken vase, or a brick painted with brilliant colours. We may wander through these galleries for an hour or two, examining the marvellous sculptures, or the numerous inscriptions that surround us. Here we meet long rows of kings, attended by their eunuchs and priests—there lines of winged figures, carrying fir-cones and religious emblems, and seemingly in adoration before the mystic tree. Other entrances, formed by winged lions and bulls, lead us into new chambers. In every one of them are fresh objects of curiosity and surprise. At length, wearied, we issue from the buried edifice by a trench on the opposite side to that by which we entered, and find ourselves again upon the naked platform. We look around in vain for any traces of the wonderful remains we have just seen, and are half inclined to believe that we have dreamed a dream, or have been listening to some tale of Eastern romance.'

The great antiquity of the objects brought to light is shown by some curious facts. Perhaps the most curious revelation of all is that which follows, betraying a comparative antiquity in a series of objects, very much in the manner of geological chronology. 'In the centre of the mound [at Nimroud],' says Mr Layard, 'I had in vain endeavoured to find traces of building. Except the obelisk, two winged figures, and a few fragments of yellow limestone, which appeared to have formed part of a gigantic bull or lion, no remains of sculpture had yet been discovered. On excavating to the south, I found a well-formed tomb, built of bricks, and covered with a slab of alabaster. It was about five feet in length, and scarcely more than eighteen inches in breadth in the interior. On removing the lid, parts of a skeleton were exposed to view; the skull and some of the larger bones were still entire; but on an attempt being made to move them, they crumbled into dust. With them were three earthen vessels. A vase of reddish clay, with a long narrow neck, stood in a dish of such delicate fabric, that I had great difficulty in removing it entire. Over the mouth of the vase was placed a bowl or cup, also of red clay. This pottery appears to have stood near the right shoulder of the body. In the dust which had accumulated round the skeleton, were found beads and small ornaments belonging to a necklace. The beads are of opaque-coloured glass, agate, cornelian, and amethyst. A small crouching lion of lapis-lazuli, pierced on the back, had been attached to the end of the necklace. The vases and ornaments are Egyptian in their character, being identical with similar remains found in the tombs of Egypt, and preserved in collections of antiquities from that country. With the beads was a cylinder, on which is represented the king in his chariot, hunting the wild bull, as in the bas-relief from the north-west palace. The surface of the cylinder has been so much worn and

injured, that it is difficult to distinguish the figures upon it. A copper ornament resembling a modern seal, two bracelets of silver, and a pin for the hair, were also discovered. I carefully collected and preserved these interesting remains, which seemed to prove that the body had been that of a female.

‘On digging beyond this tomb, I found a second, similarly constructed, and of the same size. In it were two vases of highly-glazed green pottery, elegant in shape, and in perfect preservation. Near them was a copper mirror and a copper lustral spoon, all Egyptian in form.

‘Many other tombs were opened, containing vases, plates, mirrors, spoons, beads, and ornaments. Some of them were built of baked bricks, carefully joined, but without mortar; others were formed by large earthen sarcophagi, covered with an entire alabaster slab, similar to those discovered in the south-east corner of the mound, and already described.

‘Having carefully collected and packed the contents of the tombs, I removed them, and dug deeper into the mound. I was surprised to find, about *five feet beneath them*, the remains of a building. Walls of unbaked bricks could still be traced; but the slabs with which they had been cased were no longer in their places, being scattered about without order, and lying mostly with their faces on the flooring of baked bricks. Upon them were both sculptures and inscriptions. Slab succeeded to slab; and when I had removed nearly twenty tombs, and cleared away the earth from a space about fifty feet square, the ruins which had been thus uncovered presented a very singular appearance. Above one hundred slabs were exposed to view, packed in rows, one against the other, as slabs in a stone-cutter's yard, or as the leaves of a gigantic book. Every slab was sculptured; and as they were placed in a regular series, according to the subjects upon them, it was evident that they had been moved, in the order in which they stood, from their original positions against the walls of sun-dried brick, and had been left as found preparatory to their removal elsewhere. That they were not thus arranged before being used in the building for which they had been originally sculptured, was evident from the fact, proved beyond a doubt by repeated observation, that the Assyrians carved their slabs after, and not before, they were placed. Subjects were continued on adjoining slabs, figures and chariots being divided in the centre. There were places for the iron brackets, or dove-tails. They had evidently been once filled, for I could still trace marks and stains left by the metal. To the south of the centre bulls were two gigantic figures, similar to those discovered to the north.

‘These sculptures resembled in many respects some of the bas-reliefs found in the south-west palace, in which the sculptured face of the slab was turned, it will be remembered, towards the walls of unbaked bricks. It appeared, therefore, that the centre building had been destroyed to supply materials for the construction of this edifice. But here were tombs *over* the ruins. The edifice had perished; and in the earth and rubbish accumulating above its remains, a people, whose funeral vases and ornaments were identical in form and material with those found in the catacombs of Egypt, had buried their dead. What race, then, occupied the country after the destruction of the Assyrian palaces? At what period were these tombs made? What antiquity did their presence assign to the buildings beneath them? These are questions which I am yet unable to answer, and which must be left undecided until the origin and age of the contents of the tombs can be satisfactorily determined.’

It can little surprise us, after such revelations, made, as it were, out of the dust of the desert, that an Arab sheikh one day addressed Mr Layard as follows:—‘Wonderful! wonderful! There is surely no god but God, and Mohammed is his prophet. In the name of the Most High, tell me, oh Bey, what you are going to do with those stones? So many thousands of purses spent

upon such things! Can it be, as you say, that your people learn wisdom from them; or is it, as his reverence the *cadi* declares, that they are to go to the palace of your queen, who, with the rest of the unbelievers, worships these idols? As for wisdom, these figures will not teach you to make any better knives, or scissors, or chintzes; and it is in the making of those things that the English show their wisdom. But God is great! God is great! Here are stones which have been buried ever since the time of the holy Noah—peace be with him! Perhaps they were under ground before the deluge. I have lived on these lands for years. My father, and the father of my father, pitched their tents here before me; but they never heard of these figures. For twelve hundred years have the true believers (and, praise be to God! all true wisdom is with them alone) been settled in this country, and none of them ever heard of a palace under ground. Neither did they who went before them. But lo! here comes a Frank from many days' journey off, and he walks up to the very place, and he takes a stick (illustrating the description at the same time with the point of his spear), and makes a line here, and makes a line there. Here, says he, is the palace; there, says he, is the gate; and he shows us what has been all our lives beneath our feet, without our having known anything about it. Wonderful! wonderful! Is it by books, is it by magic, is it by your prophets, that you have learnt these things? Speak, oh Bey: tell me the secret of wisdom.’

Mr Layard has some interesting remarks on the state of imitative art among the ancient Assyrians. ‘It is impossible,’ he says, ‘to examine the monuments of Assyria without being convinced that the people who raised them had acquired a skill in sculpture and painting, and a knowledge of design, and even composition, indicating an advanced state of civilisation. It is very remarkable that the most ancient ruins show this knowledge in the greatest perfection attained by the Assyrians. The bas-relief representing the lion-hunt, now in the British Museum, is a good illustration of the earliest school of Assyrian art yet known. It far exceeds the sculptures of Khorsabad, Kouyunjik, or the later palaces of Nimroud, in the vigour of the treatment, the elegance of the forms, and in what the French aptly term “*mouvement*.” At the same time it is eminently distinguished from them by the evident attempt at composition—by the artistical arrangement of the groups. The sculptors who worked at Khorsabad and Kouyunjik had perhaps acquired more skill in handling their tools. Their work is frequently superior to that of the earlier artist in delicacy of execution—in the details of the features, for instance—and in the boldness of the relief; but the slightest acquaintance with Assyrian monuments will show that they were greatly inferior to their ancestors in the higher branches of art—in the treatment of a subject, and in beauty and variety of form. This decline of art, after suddenly attaining its greatest perfection in its earliest stage, is a fact presented by almost every people, ancient and modern, with which we are acquainted. In Egypt, the most ancient monuments display the purest forms and the most elegant decorations. A rapid retrogression, after a certain period, is most apparent, and serves to indicate approximately the epoch of most of her remains. In the history of Greek and Roman art, this sudden rise and rapid fall are equally apparent. Even changes in royal dynasties have had an influence upon art, as a glance at monuments of that part of the East of which we are specially treating will show. Thus the sculpture of Persia, as that of Assyria, was in its best state at the time of the earliest monarchs, and gradually declined until the fall of the empire. . . . This decline in art may be accounted for by supposing that, in the infancy of a people, or after the occurrence of any great event, having a very decided influence upon their manners, their religion, or their political state, nature was the chief, if not the only object of study. When a certain proficiency had been attained, and no violent changes

took place to shake the established order of things, the artist, instead of endeavouring to imitate that which he saw in nature, received as correct delineations the works of his predecessors, and made them his types and his models. In some countries, as in Egypt, religion may have contributed to this result. Whilst the imagination, as well as the hand, was fettered by prejudices, and even by laws, or whilst indolence or ignorance led to the mere servile copying of what had been done before, it may easily be conceived how rapidly a deviation from correctness of form would take place. As each copied the errors of those who preceded him, and added to them himself, it is not wonderful if, ere long, the whole became one great error. It is to be feared that this prescriptive love of imitation has exercised no less influence on modern art than it did upon the arts of the ancients.' Our author then proceeds to argue that art had advanced from Assyria to Asia Minor, and thence into Greece, where it was destined to attain its highest perfection.

The dissertation on the antiquity and leading personages and events of Assyria is, after all, so vague in its results, that we find it would little profit our readers to enter into it. We prefer bestowing the small remaining space at our disposal in making reference to Mr Layard's restoration, as it may be called, of ancient Nineveh. He insists that the mound of Nimroud is the remains of the principal feature of the city. 'It is probable that the great edifice in the north-west corner of the principal mound, was the temple or palace, or the two combined; the smaller houses were scattered around it, over the face of the country. To the palace was attached a park, or paradise, as it was called, in which was preserved game of various kinds for the diversion of the king. This enclosure, formed by walls and towers, may perhaps still be traced in the line of low mounds branching out from the principal ruin. Future monarchs added to the first building, and the centre palace arose by its side. As the population increased with the duration and prosperity of the empire, and by the forced immigration of conquered nations, the dimensions of the city increased also. A king founding a new dynasty, or anxious to perpetuate his fame by the erection of a new building, may have chosen a distant site. The city, gradually spreading, may at length have embraced such additional palaces. This appears to have been the case with Nineveh. Nimroud represents the original site of the city. To the first palace the son of its founder added a second, of which we have the ruins in the centre of the mound. He also built the edifice now covered by the great mound of Baasheikha, as the inscriptions on the bricks from that place prove. He founded at the same time a new city at Kalah Sherghat. A subsequent monarch again added to the palaces at Nimroud, and recorded the event on the pavement slabs, in the upper chambers of the western face of the mound. At a much later period, when the older palaces were already in ruins, edifices were erected on the sites now marked by the mounds of Khorsabad and Karamles. The son of their founder built the great palace at Kouyunjik, which must have exceeded those of his predecessors in extent and magnificence. His son was engaged in raising one more edifice at Nimroud—the previous palaces, as it has been shown, having been long before deserted or destroyed—when some great event, perhaps the fall of the empire, and destruction of the capital, prevented its completion.

'The city had now attained the dimensions assigned to it by the book of Jonah, and by Diodorus Siculus. If we take the four great mounds of Nimroud, Kouyunjik, Khorsabad, and Karamles, as the corners of a square, it will be found that its four sides correspond pretty accurately with the 480 stadia or 60 miles of the geographer, which make the three days' journey of the prophet. Within this space there are many large mounds, including the principal ruins in Assyria, such as Karakush, Baasheikha, Baazani, Hussein, Tel-Yara,

&c. &c.; and the face of the country is strewn with the remains of pottery, bricks, and other fragments.

'The space between the great public edifices was probably occupied by private houses, standing in the midst of gardens, and built at distances from one another; or forming streets which enclosed gardens of considerable extent, and even arable land. The absence of the remains of such buildings may easily be accounted for. They were constructed almost entirely of sun-dried bricks, and like the houses now built in the country, soon disappeared altogether when once abandoned, and allowed to fall into decay. The largest palaces would probably have remained undiscovered, had there not been the slabs of alabaster to show the walls. There is, however, sufficient to indicate that buildings were once spread over the space above-described; for besides the vast number of small mounds everywhere visible, scarcely a husbandman drives his plough over the soil without exposing the vestiges of former habitations. Each quarter of the city may have had its distinct name; hence the palace of Evorita, where Saracus destroyed himself; and the Mespila and Larissa of Xenophon, applied respectively to the ruins at Kouyunjik and Nimroud.

'Existing ruins thus show that Nineveh acquired its greatest extent in the time of the kings of the second dynasty; that is to say, of the kings mentioned in Scripture. It was then that Jonah visited it, and that reports of its size and magnificence were carried to the West, and gave rise to the traditions from which the Greek authors mainly derived the information handed down to us.'

'The interior of the Assyrian palace,' adds Mr Layard, 'must have been as magnificent as imposing. I have led the reader through its ruins, and he may judge of the impression its halls were calculated to make upon the stranger who, in the days of old, entered for the first time the abode of the Assyrian kings. He was ushered in through the portal guarded by the colossal lions or bulls of white alabaster. In the first hall, he found himself surrounded by the sculptured records of the empire. Battles, sieges, triumphs, the exploits of the chase, the ceremonies of religion, were portrayed on the walls, sculptured in alabaster, and painted in gorgeous colours. Under each picture were engraved, in characters filled up with bright copper, inscriptions describing the scenes represented. Above the sculptures were painted other events—the king, attended by his eunuchs and warriors, receiving his prisoners, entering into alliances with other monarchs, or performing some sacred duty. These representations were enclosed in coloured borders, of elaborate and elegant design. The emblematic tree, winged bulls, and monstrous animals, were conspicuous amongst the ornaments. At the upper end of the hall was the colossal figure of the king in adoration before the supreme deity, or receiving from his eunuch the holy cup. He was attended by warriors bearing his arms, and by the priests or presiding divinities. His robes, and those of his followers, were adorned with groups of figures, animals, and flowers, all painted with brilliant colours.

'The stranger trod upon alabaster slabs, each bearing an inscription, recording the titles, genealogy, and achievements of the great king. Several doorways, formed by gigantic winged lions or bulls, or by the figures of guardian deities, led into other apartments, which, again, opened into more distant halls. In each were new sculptures. On the walls of some were processions of colossal figures—armed men and eunuchs following the king, warriors laden with spoil, leading prisoners, or bearing presents and offerings to the gods. On the walls of others were portrayed the winged priests, or presiding divinities, standing before the sacred trees.

'The ceilings above him were divided into square compartments, painted with flowers, or with the figures of animals. Some were inlaid with ivory, each compartment being surrounded by elegant borders and

mouldings. The beams, as well as the sides of the chambers, may have been gilded, or even plated, with gold and silver; and the rarest woods, in which the cedar was conspicuous, were used for the woodwork. Square openings in the ceilings of the chambers admitted the light of day. A pleasing shadow was thrown over the sculptured walls, and gave a majestic expression to the human features of the colossal forms which guarded the entrances. Through these apertures was seen the bright blue of an Eastern sky, enclosed in a frame on which were painted, in vivid colours, the winged circle, in the midst of elegant ornaments, and the graceful forms of ideal animals.

'These edifices, as it has been shown, were great national monuments, upon the walls of which were represented in sculpture, or inscribed in alphabetic characters, the chronicles of the empire. He who entered them might thus read the history, and learn the glory and triumphs of the nation. They served at the same time to bring continually to the remembrance of those who assembled within them on festive occasions, or for the celebration of religious ceremonies, the deeds of their ancestors, and the power and majesty of their gods.'

It must be matter of regret that Mr Layard was cut short in his discoveries by the exhaustion of the limited funds placed at his disposal by the government; and that he was compelled not only to leave much unexplored, but to cover up again with earth many monuments which he had not the means of transporting to England. We take it upon us to say that, eager as many in our country are for a reduction of the public expenditure, few would grudge the few thousands required for such a purpose as this. We would hope that Mr Layard, whose whole proceedings are so creditable to him, and who, by his work, has already established a claim to the gratitude of all the intelligent part of the community, will ere long be encouraged to return to his labours, with a view to his giving us yet a further insight into the most ancient of Asiatic monarchies.

RICHARD HOODLESS, THE HORSE-SWIMMER.

WE supposed we had heard of all sorts of heroes, but find ourselves to have been mistaken. A hero in humble life has been made known to us of quite a new order. This brave man, by name Richard Hoodless, following the occupation of a farmer near Granthorpe on the coast of Lincolnshire, has for many years devoted himself to the saving of mariners from drowning, and this without any of the usual apparatus for succouring ships in distress. Unaided by such appliances, and unaccompanied by any living creature but his horse, Hoodless has been the means of saving many unfortunate sailors from perishing amidst the waves.

Cultivating a small piece of ground, which is, as it were, rescued from the sea, and almost cut off from the adjacent country by the badness of the roads, this remarkable man may be said to devote himself to the noble duty of saving human life. On the approach of stormy weather, he mounts to an opening in the top of his dwelling, and there, pointing his telescope to the tumultuous ocean, watches the approach of vessels towards the low and dangerous shores. By night or by day he is equally ready to perform his self-imposed duty. A ship is struggling amidst the terrible convulsion of waters; no human aid seems to be at hand; all on board give themselves up for lost, when something is at length seen to leave the shore, and to be making an effort to reach the vessel. Can it be possible?—a man on horseback! Yes, it is Richard Hoodless, coming to the rescue, seated on his old nag, an animal accustomed to these salt-water excursions! Onward the faithful horse swims and plunges, only turning for an instant

when a wave threatens to engulf him in its bosom. There is something grand in the struggle of both horse and man—the spirit of unselfishness eagerly trying to do its work. Success usually crowns the exertions of the horse and his rider. The ship is reached; Hoodless mounts two or three mariners *en croupe*, and taking them to dry land, returns for another instalment.

That a horse could be trained to these unpleasant and hazardous enterprises may seem somewhat surprising. But it appears that in reality no training is necessary: all depends on the skill and firmness of the rider. Hoodless declares he could manage the most unruly horse in the water; for that, as soon as the animal finds that he has lost his footing, and is obliged to swim, he becomes as obedient to the bridle as a boat is to its helm. The same thing is observed in this sagacious animal when being hoisted to the deck of a ship. He struggles vehemently at first against his impending fate; but the moment his feet fairly leave the pier, he is calm and motionless, as if knowing that resistance would compromise his safety in the aerial passage. The only plan which our hero adopts is, when meeting a particularly angry surf or swell, to turn his horse's head, bend forward, and allow the wave to roll over them. Were the horse to face the larger billows, and attempt to pierce them, the water would enter his nostrils, and render him breathless, by which he would be soon exhausted.

In the year 1833, Hoodless signalled himself by swimming his horse through a stormy sea to the wreck of the *Hermione*, and saving her crew, for which gallant service he afterwards received a testimonial from the Royal Humane Society. The words of the resolution passed by the society on this occasion may be transcribed, for they narrate a circumstance worthy of being widely known. 'It was resolved unanimously, that the noble courage and humanity displayed by Richard Hoodless for the preservation of the crew of the "*Hermione*" from drowning, when that vessel was wrecked near Donna Nook, on the coast of Lincolnshire, on the 31st of August 1833, and the praiseworthy manner in which he risked his life on that occasion, by swimming his horse through a heavy sea to the wreck, when it was found impossible to launch the life-boat, has called forth the lively admiration of the special general court, and justly entitles him to the honorary medallion of the institution, which is hereby unanimously adjudged to be presented to him at the ensuing anniversary festival.'

As it may not be generally understood that a horse can be made to perform the office of a life-boat, when vessels of that kind could not with safety be launched, the fact of Hoodless performing so many feats in the manner described cannot be too widely disseminated. On some occasions, we are informed, he swims by himself to the wreck; but more usually he goes on horseback, and is seldom unsuccessful in his efforts. About two years ago he saved the captain of a vessel and his wife, and ten seamen—some on the back of the horse, and others hanging on by the stirrups. Should a vessel be lying on her beam-ends, Hoodless requires to exercise great caution in making his approach, in consequence of the ropes and rigging concealed in the water. On one occasion he experienced much inconvenience on this account: he had secured two seamen, and was attempting to leave the vessel for the shore, but the horse could not move from the spot. After various ineffectual plunges, Hoodless discovered that the animal was entangled in a rope under water. What was to be done? The sea was in a tumult, and to dismount was scarcely possible. Fortunately, he at length picked up the rope with his foot, then instantly pulled a knife from his pocket, leaned forward into the water, cut the rope—no easy task in a stormy sea—and so got off with safety!

All honour to Farmer Richard Hoodless, who still in

his own unostentatious way, performs acts of humanity as singular as they are meritorious! Only by accident have we become acquainted with his name and deeds of heroism, and we could not deny ourselves the pleasure of giving them all the publicity in our power.

GOLD-FINDING IN CALIFORNIA.

THE Americans appear to have some additional and unexpected reasons for congratulating themselves on the recent acquisition of California from Mexico. In the northern part of this territory, in the month of April last, it was discovered that gold abounded in the beds of the rivers and in their alluvial borders, as well as in the rocks constituting the higher grounds. A large portion of the thinly-inhabited territory has since become a scene of busy gold-finding, for which perhaps no parallel exists in the history of any country. One is at first tempted to suppose the whole affair a popular delusion, or a deliberate exaggeration, after a well-known transatlantic manner; but such theories are not tenable. We have received a Boston newspaper (*Daily Evening Traveller*, December 11, 1848), containing such documents on the subject as put incredulity as to the very great abundance of gold found entirely to flight. One of them is a report by Colonel Mason of the United States army, written at his station of Monterey, on the 17th August, to acquaint his government with the particulars of the singular affair. Another is a similar report by Mr Larkin, the United States consul at San Francisco. Both are cool business-like narrations, apparently beyond reasonable suspicion; yet they fully support the accounts which rumour had already circulated respecting the mineral wealth which has so unexpectedly turned up.

The gold district at present under attention appears to be situated on an inlet near San Francisco, called the American Fork, and on the rivers flowing into it. The territory is public property, but this seems to be as yet no impediment to the multitude of adventurers now engaged in pursuit of the gold. The Sacramento, the Feather, the Bear, the San Joachin, are names of rivers alluded to in the reports as permeating the *placer*, or gold tract. Colonel Mason, who has personally examined the country, and witnessed the strange proceedings, says—'At the saw-mill, twenty-five miles above the lower washings, or fifty miles from Sutter's, the hills rise to about a thousand feet above the level of the Sacramento plain. Here a species of pine occurs, which led to the discovery of the gold. Captain Sutter feeling the great want of lumber, contracted in September last with a Mr Marshall to build a saw-mill at that place. It was erected in the course of the past winter and spring—a dam and race constructed; but when the water was let on the wheel, the tail race was found to be too narrow to permit the water to escape with sufficient rapidity. Mr Marshall, to save labour, let the water directly into the race with a strong current, so as to wash it wider and deeper. He effected his purpose, and a large bed of mud and gravel was carried to the foot of the race. One day Mr Marshall, as he was walking down the race to this deposit of mud, observed some glittering particles at its upper edge; he gathered a few, examined them, and became satisfied of their value. He then went to the fort, told Captain Sutter of his discovery, and they agreed to keep it secret until a certain grist mill of Sutter's was finished. It, however, got out, and spread like magic. Remarkable success attended the labours of the first explorers, and in a few weeks hundreds of men were drawn thither.'

The effect upon a population of settlers thinly scattered over a rude country, or clustered in a few sea-side villages, can only be imagined by those who are acquainted with the activity and enterprise of the

American character. As soon as it was known that gold was literally to be had for the lifting in certain parts of the country, an almost universal abandonment of the common pursuits of life took place. It became impossible to retain a servant or clerk; the merchant ships, and even those of the government, were deserted in the harbours; the soldiers left their quarters without leave. Two newspapers ceased publication, because all concerned in them, from editor to printer's imp, had seen fit to set out a gold-hunting. Brickyards, saw-mills, and farms (*rauchos*), were left to solitude. The town of San Francisco became two-thirds depopulated. Mr Larkin says—'San Francisco has not a justice of the peace left. The second alcalde of Monterey to-day joins the keepers of our principal hotel, who have closed their office and house, and will leave to-morrow for the golden river. I saw on the ground a lawyer who was last year attorney-general for the king of the Sandwich Islands, digging and washing out his ounce and a-half per day; near him can be found most all his brethren of the long robe, working in the same occupation.'

In August it was calculated that four thousand persons were engaged in the finding of gold, one-half of them Indians; and it was believed that gold to the value of from thirty to fifty thousand dollars was found each day. Colonel Mason describes the people as living in tents, in bush harbours, or in the open air; and he says that, though many had large sums in gold about them, there was no such thing as crime known amongst them. The very facility of obtaining the desired metal, seemed to have made it not worth any one's while to take culpable methods of acquiring it.

With regard to the actual amount realised in individual cases, Mr Larkin gives some curious particulars. Speaking of a brief space which he spent at a place where there were eight men with two rude machines at work, he says—'The two evenings I saw these eight men bring to their tents the labour of the day. I suppose they made each fifty dollars per day: their own calculation was two pounds of gold a day—four ounces to a man—sixty-four dollars. I saw two brothers that worked together, and only worked by washing the dirt in a tin pan, weigh the gold they obtained in one day: the result was seven dollars to one, eighty-two dollars to the other. There were two reasons for this difference: one man worked less hours than the other, and by chance had ground less impregnated with gold. I give this statement as an extreme case. During my visit I was an interpreter for a native of Monterey, who was purchasing a machine or canoe. I first tried to purchase boards and hire a carpenter for him. There were but a few hundred feet of boards to be had; for these the owner asked me fifty dollars per hundred (500 dollars per M.), and a carpenter washing gold dust demanded fifty dollars per day for working. I at last purchased a log dug out, with a riddle and sieve made of willow boughs on it, for 120 dollars, payable in gold dust, at fourteen dollars per ounce. The owner excused himself for the price by saying he was two days making it, and even then demanded the use of it until sunset. My Californian has told me since, that himself, partner, and two Indians, obtained with this canoe eight ounces the first, and five ounces the second day.'

Colonel Mason speaks of what he saw on a stream called Weber's Creek:—'We found a great many people and Indians, some engaged in the bed of the stream, and others in the small side valleys that put into it. These latter are exceedingly rich, and two ounces were considered an ordinary yield for a day's work. A small gutter, not more than a hundred yards long by four feet wide and two or three feet deep, was pointed out to me as the one where two men—William Daly and Perry M'Coon—had, a short time before, obtained 17,000 dollars' worth of gold. Captain Weber informed me, that he knew that these two men had employed four white men and about a hundred Indians, and that at

the end of one week's work they paid off their party, and had left 10,000 dollars' worth of this gold. Another small ravine was shown me, from which had been taken upwards of 15,000 dollars' worth of gold. Hundreds of similar ravines, to all appearance, are as yet untouched. I could not have credited these reports had I not seen, in the abundance of the precious metal, evidence of their truth. Mr Neligh, an agent of Commodore Stockton, had been at work about three weeks in the neighbourhood, and showed me, in bags and bottles, over 2000 dollars' worth of gold; and Mr Lyman, a gentleman of education, and worthy of every credit, said he had been engaged, with four others, with a machine on the American Fork, just below Sutter's Mill; that they worked eight days; and that his share was at the rate of fifty dollars a day; but hearing that others were doing better at Weber's place, they had removed there, and were on the point of resuming operations. I might tell of hundreds of similar instances. But to illustrate how plentiful the gold was in the pockets of common labourers, I will mention a simple occurrence which took place in my presence when I was at Weber's store. This store was nothing but an arbour of bushes, under which he had exposed for sale goods and groceries suited to his customers. A man came in, picked up a box of Seidlitz powders, and asked its price. Captain Weber told him it was not for sale. The man offered an ounce of gold, but Captain Weber told him it only cost fifty cents, and he did not wish to sell it. The man then offered an ounce and a-half, when Captain Weber *had* to take it. The prices of all things are high, and yet Indians, who before hardly knew what a breech-cloth was, can now afford to buy the most gaudy dress.'

Colonel Mason describes the mode of washing out the gold where machines are used:—The cradle, as it is called, 'is on rockers, six or eight feet long, open at the foot, and at its head it has a coarse grate or sieve; the bottom is rounded, with small cleets nailed across. Four men are required to work this machine: one digs the ground in the bank close by the stream; another carries it to the cradle and empties it on the grate; a third gives a violent rocking motion to the machine; whilst a fourth dashes on water from the stream itself. The sieve keeps the coarse stones from entering the cradle, the current of water washes off the earthy matter, and the gravel is gradually carried out at the foot of the machine, leaving the gold mixed with a heavy fine black sand above the first cleets. The sand and gold mixed together are then drawn off through auger holes into a pan below, are dried in the sun, and afterwards separated by blowing off the sand. A party of four men thus employed at the lower mines averaged one hundred dollars a day.' A simple plan followed by individuals is noticed by Mr Larkin:—'A person without a machine, after digging on one or two feet of the upper ground, near the water (in some cases they take the top earth), throws into a tin pan or wooden bowl a shovel full of loose dirt and stones; then placing the basin an inch under the water, continued to stir up the dirt with his hand in such a manner, that the running water will carry off the light earth, occasionally with his hand throwing out the stones: after an operation of this kind for twenty or thirty minutes, a spoonful of small black sand remains; this is on a handkerchief or cloth dried in the sun, the emerge is blown off, leaving the pure gold. I have the pleasure of enclosing a paper of this sand and gold, which I, from a bucket of dirt and stones, in half an hour standing at the edge of the water, washed out myself. The value of it may be two or three dollars.'

'The size of the gold,' he continues, 'depends in some measure upon the river from which it is taken; the banks of one river having larger grains of gold than another. I presume more than one-half of the gold put into pans or machines is washed out and goes down the stream; this is of no consequence to the washers, who care only for the present time. Some have formed com-

panies of four or five men, and have a rough-made machine put together in a day, which worked to much advantage; yet many prefer to work alone, with a wooden bowl or tin pan, worth fifteen or twenty cents in the States, but eight to sixteen dollars at the gold region. As the workmen continue, and materials can be obtained, improvements will take place in the mode of obtaining gold. At present it is obtained by standing in the water, and with much severe labour, or such as is called here severe labour.'

The latest report on the subject is from the Rev. Walter Colton, alcalde of Monterey, dated 29th August. Our newspaper authority informs us that Mr Colton speaks to the same purpose as Colonel Mason, but refers more particularly to the abundance of gold in the hills, where it is found in rough jagged pieces, of a quarter or half an ounce in weight, and sometimes three ounces. New discoveries are daily extending the gold region. Mr Colton says that people are running about the country picking up gold out of the earth, just as hogs in a forest would root up ground nuts. They vary from one ounce to ten ounces a day: an ounce is worth from 16 to 18 dollars. One man is mentioned, whose profits from sixty Indians, employed in hunting gold, are at the rate of one dollar a minute. 'I know,' says Mr Colton, 'seven men who worked seven weeks and two days, Sundays excepted, on Feather River. They employed on an average fifty Indians, and got out in these seven weeks and two days 275 pounds of pure gold. I know the men, and have seen the gold, and know what they state to be a fact. I know ten other men who worked ten days in company, employed no Indians, and averaged in these ten days fifteen hundred dollars each. I know another man who got out of a basin in a rock, not larger than a wash-bowl, two pounds and a-half of gold in fifteen minutes. Not one of these statements would I believe, did I not know the men personally, and know them to be plain matter-of-fact men—men who open a vein of gold just as coolly as you would a potato hill.' Mr Colton estimates the amount extracted at a million of dollars a month. It appears that, meanwhile, from the cessation of regular industry, all articles of necessity are raised to extravagant prices, so that the government officers find it impossible to live on their pay.

As might be expected, the news has excited great sensation in New York and other parts of the Union. Three steamers and seven ships and barques had already, by the beginning of December, sailed for California, sailors readily consenting to go at a dollar a month, in their eagerness to get to the ground. About a dozen more vessels were expected soon to sail. It is, however, a long voyage, or rather double voyage—first 2500 miles sailing to the river Chagres, in the Isthmus of Panama; then a twenty-mile journey on mules; and after this a second voyage of 3500 miles to San Francisco. On the latter line steamers are to be placed.

It will remain to be seen whether this extraordinary windfall prove of any serious permanent benefit to America or any of her citizens. History shows that gold-finding has never yet been a permanently advantageous pursuit, and that there is nothing to be thoroughly depended upon for the benefit of men and nations, but hard work applied in an economical manner to the production of articles required for use. If America thrives by picking up the precious metal in the wilds of California, she will be an exception from a pretty well-established rule.

INDIAN BHANG.

No one who has lived in India, and is acquainted with Asiatic manners and customs, can fail to be struck, when he reads Stephen Barrow, and such modern writers, by the great similarity which exists between the Egyptian and the Hindoo. The hieroglyphics depicted in the tableaux of ancient lore—the pictures of implements of husbandry, household furniture, manner of irrigating the land, carrying water—all tell the same

tale; and the conviction remains forcibly upon the mind, that the two nations must have had the same origin, or have been closely united, perhaps by traffic, in days gone by. The use of hashish (described in Journal, No. 256) is common to both, and serves as another connecting link.

The hashish or bhang is used by the Hindoo because fermented and spirituous liquors are forbidden by his religion, although they are given to the gods as offerings, by placing them behind the idol, and out of human sight. Although even the Brahmin not unfrequently partakes of bhang, those who indulge in it are looked upon in the light of debauchees; and sober folk shake their heads at them, and bhangie and ganja khore are opprobrious terms.

Bhang is the leaf of the male plant of the hemp, dried in the sun; when fresh, the leaf has a pleasing odour; but I am not certain whether it retains it when dried. Ganja is the same leaf; but being rubbed down in the hand to powder, and smoked in a nariella (a kind of hookah), retains the name of the plant; and the epithet of *churres* is given to the dried flower and stamen, which must naturally be more delicate and scarce, and on that account dearer. Churres is frequently made into tablet and luddos, or balls of sugar-candy—a dainty sweet-meat for the Hindoo, who gets bemused as he sucks or nibbles the sweets; and I have heard the feeling they occasion described by a friend as that of being plunged into a pleasing reverie, which was, however, every now and then broken by a sensation of being hoisted up into the air, and let down again with a shock.

The preparing a *lotah*, or jug of bhang, is accompanied by as much joviality and gossip among the partakers as the mixing of a bowl of punch or negus is with us; and many a time have I noticed an old favourite servant as he sat over the orgies of the bhang. Wherever Peerun travelled, his bundle of bhang went with him; and at mid-day, after his ablution and *poojah*, and lunch of parched rice or peas, a stone mortar and a wooden thiel, made of hard baubul, or thorn-wood, were produced, at the sight of which a few favourite friends or fellow-servants speedily collected. The humblest of these would undertake the pulverising of the leaf, which was done by rapid friction in the stone mortar with the wooden pestle. This was accomplished in about ten minutes, and water being poured over it, the liquid was strained through a piece of muslin; to this was added some sugar, and sometimes ginger or pepper, to make it more palatable. The host generally took a draught himself first, taking care, as usual, not to touch the lotah, or brass goblet, with his lips; but sitting on his haunches, and putting back his head, allowing the favourite beverage to slide down his gullet. His humble friends generally got each a small brass *cotorah*, or cupful, and drank it with relish and applause. The party soon after dispersed, and Peerun was seldom fit for any work or business after this: his eyes became bloodshot, his speech thick, his mind confused; in a word, he became drunk, and retired to his hut, or, on a march, he took himself to the shade of a tree; and there he dozed or slumbered, and enjoyed his reveries till three or four hours sobered him again. He then bustled about, and began to think of a regular meal, which was always cooked by his own hands about the gloaming.

Although a daily bibber of bhang, Peerun was a faithful and trustworthy servant, and in good circumstances; and when known to me, the noxious weed had not impaired either his health or intellect. But this is not always the case: the bhangie and ganja khore must be able to live well and comfortably: he must have plenty of milk and *ghee* (clarified butter), and not be stinted in food, otherwise he grows lean and withered—his hands and feet become long and attenuated, his eyes dull, and the white of the eye yellow and bloodshot. Costiveness is also a consequence, and the poor debauchee at last falls a sacrifice to his favourite drug. Bhang is not a cheap luxury: it costs the Bengalee as much as our Souchong costs us; and considering the

poor circumstances of the Indian, it occasions him a greater outlay than tea does here to a comfortable householder. A ganja khore and bhang bibber may frequently, therefore, be known by his rags and hungry look. Smoking does not produce so great a degree of intoxication as drinking, but the same evils follow in its train. However strange and incredible it may appear, I will not hesitate to relate a fact which I witnessed during a march; namely, the giving of a small portion of bhang to some working bullocks. The oxen were in beautiful condition; and upon remonstrating with the man under whose charge they were, as to the bad effects the drug might have, he only laughed at my fears, and maintained that the bullocks, after being shampooed and curried, looked to their dram to invigorate them, as a hungry man to his food, and that they could stand their work and fatigue all the better for it—with what *truth* I never had time to investigate thoroughly, as I lost sight of the man and his cattle after the march was finished. Giving bhang to cattle is, however, not a common thing, and may therefore be known to few Europeans.

Native doctors occasionally use bhang externally as a medicament, as we do laudanum, to deaden pain. It is tied in a bundle, warmed at the fire, and applied as a fomentation.

The *datura* or *stramonium* is a common weed in Hindoostan; and, like the foxglove, delights in a rich and moist soil. Who that saw it in all its beauty, clad with large white, trumpet-shaped, sweet-smelling flowers, would think that death and insanity may be brought on by its thorny apple, or rather the seed contained in the apple of this beautiful plant. It is a well-known poison to the Bengalee, who mixes it in small quantities with the rum which he sells to the European soldier, and gives it in large doses to an enemy whose mental powers he wishes to destroy for ever; and *certainly*, when not counteracted in time, the derangement of the brain brought on by *datura* becomes lasting. I have seen raving madness, melancholy madness, and merry madness, all produced by the use of this drug: according to the constitution, the poison acted differently.

In one gentleman's family I witnessed a case in point. A Hookaberdar, who had been concerned in robbing a female, had clandestinely brought the property home; not undetected, however, by some of his fellow-servants. The woman suspected him, took out a warrant, and his master's premises were searched; but the cunning thief had thrown the purloined jewels into a well, which, on account of its brackish water, was in disuse in the household, and consequently it had almost got dry, and choked up with weeds and bushes. The police were unsuccessful in their search; but two of the servants, who knew of the well, threatened to inform unless they received a *douceur*. The pipeman therefore mixed up a large dose of *datura* seed, ground to powder, with their curry; of which, being mess-fellows, they both partook.

In a short time the cook began to rave about roasts and puddings, and although it was night, began to sweep out the kitchen, and make noisy preparations for the mid-day meal. The other man, who was a sort of valet, and had charge of his master's wardrobe, came up stairs, pretended he heard the bugle, and insisted upon laying out the clothes and accoutrements for parade, and in his confusion of mind upset the boxes and toilet of his master. All this of course occasioned a great stir and disturbance in the household. The patients, however, were not allowed to go on in their mad career, but were separately shut up for the night by the master's direction, and medical aid was procured for them in the morning. Cooling salts, lime-juice and water, also vinegar and water, were prescribed, with the frequent use of the shower-bath; which measures were successful, restoring in a few days the patients to sanity. I may add that ample evidence being produced against him, the Hookaberdar was brought to condign punishment, set to work on the road, and disgraced for life.

BRINGING IN THE NEW YEAR IN GERMANY.

There is plenty of dancing going on in Germany. Glee-wine, a sort of negus and punch, is brought in after supper, and just before twelve o'clock. Every one is on the watch to win the New Year from the others—that is, to announce the New Year first. Accordingly, the instant the city bell is heard to commence tolling, 'Prosst Neu Jahr!' starts from every one's lips; and happy is he who is acknowledged to have made the exclamation first, and to have won from all the others the New Year. In every house at that moment, all over the country, is shouted 'Prosst Neu Jahr!' prosst being no German word, but a contraction of the Latin *prosit*. On one occasion, having retired to rest, our servants assembled at our room door and woke us, in order to cry 'Prosst Neu Jahr!' On the following morning, every one that meets you salutes you with the same exclamation. With the glee-wine are brought in, on a waiter, the New-Year wishes of the family and its friends. These are written in verse, generally on very ornamented gilt note-paper, and sealed up. When the Prosst Neu Jahr has passed, and all have drunk to one another a happy New Year, with a general touching of glasses, these are opened and read. For the most part they are without signatures, and occasion much guessing and joking. Under cover of these anonymous epistles, good hints and advice are often administered by parents and friends. Numbers of people, who never on any other occasion write a verse, now try their hands at one; and those who do not find themselves sufficiently inspired, present those ornamental cards of which I have spoken under Christmas, and which have all kinds of wishes, to suit all kinds of tastes and circumstances. These are to be purchased of all qualities and prices; and those sent by friends and lovers generally appear on New-Year's Day, and are signed or not, as suits the purpose of the sender.—*William Howitt's Rural and Domestic Life of Germany.*

COFFEE-ROOMS AND READING ALOUD.

'There is only one thing you now want at — to complete your institutions for the good of the working-classes—a large, comfortable, well-lighted coffee-room with a good fire, where every workman, not finding in himself the taste or ability for science of any kind, might enjoy himself in an evening over a cup of coffee (nothing else being sold), and in listening to the reading by some young men in turn of amusing books—as the Arabian Nights' tales, Sir Walter Scott's novels, &c. &c. I have long thought all our plans for the good of working-men will be imperfect if we do not look to that large class, too old and inert to begin to study science, and unable or unused to read, but of which many might be weaned from the ale-house if the enjoyments of a clean room, blazing fire, and cup of hot drink for twopenny were offered them, with the substitution of listening to amusing reading, instead of the thrice-told yarns of their pot-house companions. My attention was first directed to this matter by Sir John Herschel's very striking anecdote of the labourers in a village who assembled every night at the blacksmith's shop to hear one of them read Richardson's "Pamela," the history of whose fortunes attracted so numerous and constant an auditory, and excited so intense an interest, that when, after many weeks' reading, the tale was finished, the whole party adjourned to the church and rang a merry peal, to express their delight at the heroine's triumphant success over all her temptations. Now if the blacksmith's shop, in spite of the anvil's din, and sparks, and without the attraction of ale and gossip, could thus nightly bring together an eager company, why should not a snug warm coffee-room, with the similar banquet of an interesting tale? There would be no difficulty in finding competent readers among the better-educated class of young men, who could scarcely more effectually serve the cause of morality, and indeed of knowledge; for, by degrees, for mere light reading might be substituted voyages, such as Anson's, &c. which Somerville tells us in his autobiography were sufficient attraction, when read by him aloud in harvest at dinner-time, to surround him by a crowd of listeners.'—*Extract of a Letter.* [We have, on former occasions, recommended the plan here described. It still has our best wishes; but we have been sorry to learn that in one large town in Scotland, where it was tried by a person of remarkable energy, the working-classes did not take so much advantage of the benefits held out to them, as might have been expected.]

SONNET.

TO L.—CHRISTMAS, 1848.

How shall I crown thy uncomplaining brow,
Sweet shape of my day-dreamings! when I built
Young Edens for thee?—Look where'er thou wilt,
'Tis the same wayward world of wail and wo.
Bright flowers I would have brought thee, but they blow
In the sun only, and but blow to die:
Our day is sunless—wintry is our sky;
And so I have chosen thee better. *Christmas, lo!*
Here plucks them for thee. *Ivy*, ever green,
Winter or summer, clinging still the same
To old as young—to ruined as to new;
And thorny *holly*, but these thorns between
Bright berries, peeping with their eyes of flame.
Such crown be thine! Like *thee* 'tis cheerful, constant, true.

M. S. J.

INTELLIGENCE IN A FISH.

At a recent meeting of the Liverpool Philosophical Society, Dr Warwick related an extraordinary instance of intelligence in a fish. 'When he resided at Durham, the seat of the Earl of Stamford and Warrington, he was walking one evening in the park, and came to a pond where fish intended for the table were temporarily kept. He took particular notice of a fine pike, of about six pounds weight, which, when it observed him, darted hastily away. In so doing, it struck its head against a tenterhook in a post (of which there were several in the pond, placed to prevent poaching), and, as it afterwards appeared, fractured its skull, and turned the optic nerve on one side. The agony evinced by the animal appeared most horrible. It rushed to the bottom, and boring its head into the mud, whirled itself round with such velocity that it was almost lost to the sight for a short interval. It then plunged about the pond, and at length threw itself completely out of the water on to the bank. He (the doctor) went and examined it, and found that a very small portion of the brain was protruding from the fracture in the skull. He carefully replaced this, and with a small silver tooth-pick, raised the indented portion of the skull. The fish remained still for a short time, and he then put it again into the pond. It appeared at first a good deal relieved; but in a few minutes it again darted and plunged about, until it threw itself out of the water a second time. A second time Dr Warwick did what he could to relieve it, and again put it into the water. It continued for several times to throw itself out of the pond, and with the assistance of the keeper, the doctor at length made a kind of pillow for the fish, which was then left in the pond to its fate. Upon making his appearance at the pond on the following morning, the pike came towards him to the edge of the water, and actually laid its head upon his foot. The doctor thought this most extraordinary; but he examined the fish's skull, and found it going on all right. He then walked backwards and forwards along the edge of the pond for some time, and the fish continued to swim up and down, turning whenever he turned; but being blind on the wounded side of its skull, it always appeared agitated when it had that side towards the bank, as it could not then see its benefactor. On the next day he took some young friends down to see the fish, which came to him as usual; and at length he actually taught the pike to come to him at his whistle, and feed out of his hands. With other persons it continued as shy as fish usually are. He (Dr Warwick) thought this a most remarkable instance of gratitude in a fish for a benefit received; and as it always came at his whistle, it proved also what he had previously, with other naturalists, disbelieved—that fishes are sensible to sound.'

CHANGE OF OPINION.

He that never changed any of his opinions, never corrected any of his mistakes; and he who was never wise enough to find out any mistakes in himself, will not be charitable enough to excuse what he reckons mistakes in others.—*Dr Whicote.*

MAN THE DISCONTENTED ANIMAL.

It is remarkable that man is the only animal that manifests discontent. This should either derogate from the general estimate of human worth, or it should make discontent respectable. I will not now pause to debate this point. I am struck, however, by the comparison between man and every other species of air-breathing animals as to their comparative grounds for discontent. Most undoubtedly, the species of such animals which has least cause for discontent with its lot in this world, is that one which alone manifests discontent—namely, *homo*.

I do not know if it occurs very often to any one to consider the immense over-proportion of space which the human species has obtained on the earth's surface, in comparison with any other mammalian animal approaching to the same bulk. It is supposed that there are now from nine hundred to a thousand millions of human beings scattered over the globe. They have been increasing for ages, and seem as if they were yet to become much more numerous. The other animals in question have been as continually shrinking in numbers, excepting only those species which man encourages to breed for his own use; and they seem as if they would go on shrinking, while the human population advances. The lion, with all his kingly pretensions, the tiger, leopard, and other *Felinae*, are rapidly becoming curiosities on the face of the earth, and in no long time will be extinct, or nearly so. In England and other civilised countries, the wolf, beaver, and other animals have vanished within the observation of history. Some others, as the elephant, rhinoceros, and great stag, appear, from their remains discovered in superficial deposits, to have perished before the island received a human population. All over the north of Europe and Asia, as well as North America, there was about the same period an abundance of elephantine animals, where only their bones are now to be found. Man may indeed be considered as a new landlord, who has come in upon these regions and evicted one-half or more of the former tenantry. Wherever he has set his foot, he has had it in his power to tell other mammals whether they might stay or not. Those which he thinks useless must become scarce immediately. To others he can say, 'Well, I shall make some use of you; you may remain;' and they remain accordingly, but only to be his slaves. In some cases he has taken a fancy to animals which he had formerly banished, and given them a new footing as curiosities, or for the purpose of preying upon them; for example, the capercaillie, or cock of the woods. In the Highlands of Scotland, at this moment, he is granting to deer and grouse a larger scope than they perhaps ever had in less civilised times; but the *Tetraonidæ* need not plume themselves on this, nor the *Cervidæ*

carry their heads too high, as it is only to make game of them. In North America, we have seen for some ages a rapid increase of man with his train of serviceable animals, while the aboriginal beasts, the buffalo, deer, beaver, and many others, are perishing. In numbers he is a myriad, while they are everywhere but a handful. Such is also the case even with the domesticated animals; for dogs, though by no means scarce anywhere—horses, cattle, notwithstanding the encouragement given to their propagation—would make but a poor appearance in a census in comparison with their masters. It is rather amusing that the only creatures which can resist man, and keep their ground in co-ordination with himself, are the rats and mice, whose very insignificance in their individual capacity may be said to be their protection as a species. All others, it is evident, live only by his permission, and in as far as he finds them conducive to his own gratification.

These remarks, it will be observed, apply chiefly to mammalian animals; they might be extended farther down the scale, though not with the same force. They would be entirely true of the birds; for all the predaceous animals of this class are exactly in the same predicament with the beasts of the wild, while those useful for food are alone encouraged to breed; and the field-birds may be placed in the same category with the rats and mice, as maintaining a sort of defying position. They would also be true of the reptiles, which are everywhere shrinking from before the face of man. Fishes are palpably less liable to be affected by us, in consequence of their field of existence being so different from ours. The invertebrates are likewise comparatively safe in their individual pettiness and obscurity; although, as one remarkable fact, the pearl-oyster has almost completely disappeared from the Cingalese waters through the imprudent covetousness of man. With regard to land creatures of this kind, as insects, although it is often pointed out that they can more effectually trouble and injure us than any large animals whatever, it is also true that many of them have sunk before us. We clear a country of its woods, and substitute cerealia: myriads of insects and other small animals perish in consequence, simply because they have no longer requisite shelter and food. Whole genera have in this way become extinct in various parts of the earth.

Somewhat odd it must be admitted to be, that the one animal which has thus, for thousands of years, been killing and eating, extirpating and encouraging the rest, and which has been able to spread itself in multitudes over the earth, while others have been continually shrinking into smaller space, is the sole animal which ever grumbles at its fate.

This may be said to be the case as regards species against species. Let us now see how it fares with the individuals of the human species as against the indi-

viduals of other species. We hear much of the difficulty of procuring a subsistence in this world, of over-population, and of the sad outlet from these evils through disease and mortality. Most undoubtedly there is not certain meat for every new human mouth: be it from what cause it may, be it wholly remediable or not, such is the fact. But is this true of the human species only? Alas! no. With no other species is there certain food for every particular mouth. With every one of them, the expansion of their numbers must be submissive to the accident of the amount of provision.* All are liable to occasional short commons, and multitudes are continually dying off to allow room for the remainder. In some of the obscurer walks of creation, it is only vouchsafed to certain species—as, for example, the parasites on corn—to live now and then, as occasion may arise in the course of certain physical contingencies. Let the weather improve to human sensation, and whole genera will perish at once, remanded to the dormancy of the ovum for years to come. Even species so high as birds are sometimes all but extirpated by the severity of seasons. All this time the enormous abundance of human population is allowed to remain, with only a few occasional croppings of the weaker members. Our deviceful genius and foresight, and the control we are enabled to exercise over our inclinations, enable us to get over the synopses of visitations of Providence with comparatively little suffering. And yet so it is that we are the discontented animal.

We have still another contrast to draw between man and the inferior creatures. Of these no single specimen has it in its power to extort from nature one-thousandth part of the enjoyment which man may realise by his labour and ingenuity. It is true that their wants are narrow, and when these are satisfied, as in fair circumstances they usually are, there is no occasion for complaint. Man, on the other hand, has an infinitely greater number of needs, and the disappointment he suffers when these are not gratified is very poignant. He is born to trouble, as the sparks fly upward. But it could be easy to show that it is better to have many desires, even at the hazard of these being somewhat starved, than to have few or none, with no such danger. Man clothes himself, houses himself, exalts the palatableness of everything he eats by cooking, bewitches himself with fine music and exquisite works of art, indulges in gorgeous dreams, obtainable through the medium of history and elegant literature, and in fancy may escape from any sordid character or situation into one purely heroic and dignified; none of which privileges belong to the lower animals. By industry he may surround himself with numberless blessings, and under favour of social laws, he may store these up to any amount for future use, or for the use of his posterity. No such advantages are in the power of the unhouseled denizens of the common and covert. On them every need falls with its own direct and immediate force; and if it cannot be satisfied at the moment, there is no remedy. Yet, again, with all these immense boons conferred upon him by the Almighty, man is the only discontented animal!

It thus appears as if our discontent were a very unreasonable thing, and that the humbler animals excel us in this respect. But can such a doctrine be received? Assuredly not. Among all the eccentricities of philosophy, no one could be found to maintain that the unrepining submission of these animals to the routine of their lot, and to every contingency of external nature, is to be more admired than the restless solicitude of man to remedy all passing evils, and improve his situation upon the earth. Seeing the connection between the easy contentment of the lower animals and a humble grade of intellect, and between human discontent and comparatively high intellect, we cannot avoid the conviction that discontent is a thing relative to a superior mental development. The alternative, then, to be chosen in the dilemma with which we set out, is, that there is a respectability in discontent as concerns our

general character. We have it as a privilege, as part of the outshining glory of human nature, not to be too easily pleased or satisfied. Observe, it is only so as concerns our general character, and, it may be added, our general status on the earth. A grumbling, unsatisfiable temper remains in the individual as ugly a feature as ever; and to every one in his own particular walk and immediate circumstances, a contented and resigned spirit must be great gain. Thus it is that every disposition in human nature has its good and its bad aspect; or it may be more expressively said, there is a virtue and a vice in everything.

FROM THE GREY TO THE WHITE.

FIFTY years ago, could we have followed a piece of cotton cloth from the loom, we should have seen it packed in great bales, and shipped off to Holland to be whitened. Could we have watched its further progress, we should have seen it consigned to some Dutch bleacher, and under his hands undergo a process of boiling in potash lees, and of subsequent washing and soaking in buttermilk, and then we might have beheld hundreds of acres of green grass covered with the fabric, forming one immense carpet of calico. After an exposure to the summer sky for months, autumn would see it all gathered up again, repacked, reshipped, and in the hands of the English manufacturer once more. Indeed in many instances we need not have left England to see this primitive method of bleaching, for many a fair English field was likewise turned into a 'bleaching croft.' A period extending over several months was thus necessary to give a snowy lustre to this product of the loom.

Science has now outstripped time and the whitening influence of the solar ray; and by a combination of many, but simple and rapid processes, has wrought out in a day what was formerly the work of many weeks, even when aided by the most favourable atmospheric influences. We propose, by recounting what was brought under our personal observation at one of the great bleach-works of this country, to bring the various interesting steps by which this remarkable process is so swiftly effected under the reader's notice, satisfied that it both deserves and will receive his willing and attentive consideration. The last of the textile processes concerned in the production of calico, power or handloom weaving, leaves the cloth in a condition as to colour and surface wholly unfit for the finer purposes of human life. Technically, the cloth is said to be in the 'grey;' but in reality its hue is that of a pale buff. This is due to the presence of resinous and amylaceous colouring particles in, or united with, the vegetable fibre. As these, in the process of bleaching, are acted upon by chemical reagents, which do not, at least when applied in the same proportionate strength, affect the vegetable fibre, they are partly extracted from the tissue, and partly decomposed. Thus bleaching—so far as principles are concerned—becomes resolved into a very simple process; although, it must be added, certain curious chemistries are concerned in it, the exposition of which is not very easy. The surface also of the cloth is so manifestly rough, downy, and covered with loose fibres, that it is evident it must be submitted to some smoothing procedure before it can possibly be fitted for apparel or for the process of calico-printing. The last of these processes—the 'smoothing'—will be very quickly got over; but the first—the extraction and decomposition of the colouring principles of the calico—will occupy the entire remaining portion of our paper.

A vast chimney, standing in solitary majesty, and blackening the whole sky with the smoke of its pipe, marks out the position of the great bleaching establishment we visited. The peculiar sound of dashing and tumbling waters, with the deep roll of machinery, and with every now and then the escape of a cumulus of steam up into the air from the roof of one portion of the building, assures the visitor he has not mistaken

his destination, and the opening door lets him in to the tumultuous scene of labour. A strong smell of burnt tinder fills the air, and is perceived to proceed from a low-roofed, small building, detached from the rest of the establishment. This is the 'singeing' house. Standing at the door of this place, a rather alarming scene is brought before the eye. There is a low furnace in the centre of the room, with a fire beneath glowing at white heat. At the upper part of the furnace is a semi-cylinder of copper, heated to a bright red, and a man is seen winding a long piece of calico right over this burning metal. Every instant we expected the fabric to burst into a blaze. But no! a cloud of glowing sparks rose up the chimney, but the tissue continued to pass smoothly and safely over, being wound on to a roller, and wetted as it was wound up by a number of minute jets of water. This process is repeated three times—twice on the 'face,' and once on the back of the calico. By this curious plan all the light downy matter is actually burnt clean off; yet the fabric is uninjured, in consequence of the rapidity with which it is made to pass over the hot metal. One ton of coal, in a good furnace, will by this simple method smooth about twenty-four miles of calico! The cylinders used to be of iron, and were burnt away in a week; now they are copper, and last for two or three months. A more ingenious process has been patented, in which the downy particles are burnt away by causing a number of minute jets of gas to be, as it were, sucked through the fabric, and thus these light particles are consumed and carried away in an instant. We believe there are actually large singeing works in which this patent is carried out, where only *singeing* is done; but the process applies to a great number of other goods besides calico—such as bobbin-nets, muslins, &c. To have had such a piece of cloth as this looks now, being of a deep nankeen colour, from the effects of the singeing, put into his hands to bleach, would have driven a Dutchman almost to despair half a century ago; and it does in fact look as if we had made a step farther back instead of in progress.

The first great object has now been accomplished. The surface of the fabric is in that condition as to evenness and freedom from down which the manufacturer desires, and which the ultimate processes it is to be subjected to imperatively demand. The roll of cloth is therefore removed, and conveyed in trucks to that portion of the works which, though the entire series of processes is now totally different, still retains the old name, the 'bleaching croft.' It is an apartment of great size, paved with freestone, and abounding in cisterns, drums, and shafts in great numbers; and it would be well for the visitor to be furnished with waterproof shoes and upper clothing if he would watch minutely the various splashing operations which are conducted here. Some expert needlewomen are stationed in one part of it, whose duty it is to sew the ends of the pieces of singed cloth together until a continuous web is formed, containing from 400 to 500 pieces, and being from 6 to 8 statute miles in length. This vast quantity of cloth is disposed in a convenient heap, and one end of it is drawn into the washing-engine. This machine consists of two long horizontal wooden rollers, one of which is suspended above, and the other lies under water in an appropriate cistern. The cloth passes over and under these rollers a great number of times in a gentle spiral, and leaves them in the middle, to travel onward, and to be laid in folds on a four-wheeled truck a little in front of the machine. As a large supply of pure water is continually pouring into this engine, the soiled water escapes from it, and carries with it all that 'dressing' or paste which the weaver so sedulously introduced in the manufacture of his cloth. It would thus not be difficult to show that many thousands of barrels of flour are actually wasted in giving an *appearance* to the cloth; and the first machinery which applies the dressing, and the last, whose only intention is to remove it from the same fabric, with their original cost of construction, and

the continued outlay of power for their working, being also taken into consideration, it would become manifest that many thousands of pounds are thrown away in the attempt to make an article look better than it really is.

The intention of the next process is the extraction of any resinous or oily matters from the cloth. To effect this, at the farthest side of the croft-house there is a set of curiously-arranged caldrons of cast-iron, seven or eight in number, and sufficiently capacious to hold *each* enough of cloth to describe, if laid evenly down, the circumference of the metropolis. These are called technically 'keirs.' They are of a curious construction: in the centre of each is a perpendicular iron pipe, with a sort of bonnet over its orifice; they have also a perforated false bottom, into which steam is blown; and when the caldron is filled with water and cloth, the injected steam forces up the water in interrupted jets through the pipe, which, by means of the bonnet, disperses it all over the cloth; and this process is continued, the liquor being a strong lye of lime, for eight hours, 1500 pieces being boiled at once. To see one of these great boilers in full work is to have a mimic geyser brought before the eyes, whose roarings and spoutings would not do discredit to the great original. The cloth is hauled out of the keir at the conclusion of this process by revolving rollers, and once more passes, at the rate of four or five miles an hour, through the washing-engine. All the alkaline liquor which it contained is thus washed away; but in order to insure its removal more completely, the cloth travels from the washing-engine into one upon precisely similar principles, only that, in the place of water, it is made to contain a very dilute solution of sulphuric acid and water. This is called by the artisans employed in the process the first 'souring.' From the souring-engine it is again taken to be washed in pure water, to get rid of the superfluous acid; and if the cloth is now examined, it will be found to be gradually gaining a whiter aspect, though still far from white. It has now to undergo another boiling. Once more the revolving rollers, which are suspended from the ceiling in a convenient position near the keir furnaces, are set in motion, and pour down a swift stream of cloth into the hot and yawning caldron beneath. The keir is this time filled with a dilute solution of soda-ash, and the boiling is continued for ten hours. This time being expired, the end of the immense length is hauled out, and put in connection with the hard-worked washing-engine, which fulfils its usual office, and discharging the washed cloth, it is directed by a man into a square receptacle, and stacked up there.

From this point the other class of bleaching principles come into play. The resinous and oleaginous matters have been fully extracted by the previous alternate alkaline lixiviations and washings in pure water. The colouring principles which remain, and give the cloth now a dirty pale yellow tinge, not being amenable to the powers of alkaline solution, must be dealt with by direct chemical energies. This, in fact, is the commencement of what in strictness should be called the bleaching process. The preparation vulgarly called chloride of lime, more properly chlorinated or chloruretted lime—for the first phrase indicates a chemical composition which does not belong to it—is that which effects this remarkable decomposition. It has received the strange-sounding title of 'chemick,' probably to contrast bleaching by chemical with the old plan of bleaching by solar influence. The 'chemicking' process is thus conducted: about twenty-two pounds of 'chloride of lime' are mixed together with water, and the solution being brought to a proper strength, is conveyed into a machine of the same construction as the washing-engine. The end of the piece is then directed over certain pulleys, and enters the bleaching-trough, where it is repeatedly immersed in the chlorinated solution; and on leaving the machine, is guided by a boy into a recess, where it lies in great coils for several hours. When it is considered to have

lain long enough, it undergoes a second process of immersion in dilute sulphuric acid and water. The effect of this is to produce a chemical decomposition in the chlorinated lime; the lime quits its equivalent of chlorine under impulse of the stronger affinity it entertains for the acid, and the gas thus liberated in every fibre of the cloth, decomposes the colouring principles, leaving the cloth almost in a state of perfect whiteness. The washing-machine again receives it, and cleanses away the acid; it is then soaked in a solution of soda, in order to avoid any free acid entering with it into the further processes; and again it is washed in clean water. It then goes through a second chemicking, is again allowed to lie, and is again soured, and afterwards washed. The cloth is now perfectly white; its complexion will endure even the favourite comparison—'as white as snow.' Every trace of colour has been removed, and a spotless purity is left. It is then thoroughly soaked in hot water, is passed between a pair of wooden rollers, which perform that hydro-extractive operation called by the laundresses 'wringing,' by squeezing the cloth powerfully as it passes between them until it is almost destitute of water, when it takes a final leave of the croft in which it has played so many bustling parts, by disappearing from view through a hole in the ceiling.

A general analysis of these numerous processes—in all, *seventeen* in number—will facilitate our apprehension of the whole subject. Looking at them with attention, they resolve themselves into three classes:—1. Alkaline lixiviation; 2. Application of the chlorinated solution; and 3. Its decomposition in the fibres of the tissue by dilute sulphuric acid. The washing is to be considered simply as a depurative process. These processes look to two kinds of colouring matter in the cloth: one soluble, and removable by solution in alkaline liquors; the other insoluble, and only to be removed by making up its chemical composition under the influence, it has been supposed, of nascent oxygen, which some views of the chemical phenomena concerned would appear to show present in the case. We do not intend, however, to plunge the reader into a maze of chemical problems. A clear conception of the whole may be gained by bearing in mind the few and easy principles above stated. No one entering the croft ignorant of these could fail to be perplexed to the last degree by the apparently inextricable confusion of the numerous operations passing before his eyes. The number of white bands which, like huge serpents of endless length, fly hither and thither above his head, as if bewitched, and without the agency of human intervention to control their evolutions; the rattle of the pulleys over which they run; the dashing of the water in the washing, bleaching, and sousing-engines; the clattering of trucks on iron wheels, bearing their dripping loads to various places; and finally, the deep-mouthed, muffled roar of several of the keirs—all unite to form a scene the most extraordinary and confounding imaginable.

Mounting a flight of stairs, we have the snowy cloth once more brought under our notice. Here the long compound piece is unripped into the original lengths, which, united, extended to 70,000 yards, or about 24 miles. They are then individually folded, and as far as possible rendered free from creases. Thence they are taken into large drying apartments, with lattice-windows, the temperature of which is kept at a considerable elevation by means of steam pipes, and being suspended on long poles, they are quickly dried. After a little time they are removed from hence to the folding and packing-rooms; from which places, after having been put up in convenient parcels, they are sent off to the Manchester warehouses, or possibly to the print-works connected with this establishment at Mayfield in Manchester.

This beautiful process, on the whole, is perhaps more indicative of our era than many which receive more attention from the curious. It shows us science in one of its most elegant applications to art. It shows us

also the resources of our splendid and powerful mechanism applied to carry out the purposes of philosophy. And when, unitedly, we consider the science, skill, and capital, which meet only to change the colour of a vegetable tissue to one which is the synthesis of all colour, we have before us a manufacturing process which the thoughtful mind will not fail to endow with a very high rank in the list of the *notabilia* of our time and country.

THE CONDUCTA DE PLATAS.

I HAD been for some days in a state of uncertainty whether to travel from Mexico to Vera Cruz in my usual manner, or to take a seat in the diligence, which, drawn by fleet horses, performed the journey in four days. It was rarely, however, that the vehicle escaped a summary visitation by the numerous robbers who infested the route. A simple incident decided me. Advantage was taken of a temporary lull in the internal affairs of the country to despatch a rich *conducta de platas*, or convoy of silver, to the coast; and while watching the process of loading the mules in a courtyard of the street in which I lodged, I determined on attaching myself to the escort selected to accompany the train. About twenty muleteers, whose imprecations embraced every variety of tone, were packing the bags of dollars in small wooden chests, and strapping them to the backs of the mules. Each *talega*, or bag of 1000 dollars, weighs between sixty and seventy pounds, and a load comprises from four to six bags. The animals, as soon as the precious burdens were properly secured, grouped themselves instinctively together in one corner of the enclosure.

The *arriero* (chief muleteer) was signing the last vouchers, interrupting himself from time to time to invoke the Virgin and saints for a successful journey, or to storm at his assistants. In the street a crowd was collected, gazing with greedy eyes on the two millions of specie, exposed to all the hazards of a long and perilous route; and the greater part of these tattered spectators took no pains to dissemble their covetousness.

'*Canario!*' exclaimed a *lepero*, hiding the scars on his breast under a ragged blanket, 'if I only had a horse like the one between that cavalier's legs.'

The lepero's eye designated a swarthy-complexioned *ranchero*, mounted on a jet-black steed. The animal, held in check by his rider, champed his bit, and shook off flakes of foam to the right and left. I could not but admire the beauty of the horse, and remark at the same time the unconcern of the rider, who appeared to restrain the creature solely by the force of an inflexible will—a distinctive characteristic of Mexican horsemen.

'What, then, friend Gregorito, what would you do?' inquired one of the lepero's companions.

'*Canario!* I would accompany the *conducta* as far as a certain place that I know on the road; and although it may be wrong to boast, I should be unlucky indeed if my wishes were not gratified by a load or two.'

'One or two loads!' rejoined the other with an air of surprise.

'Yes; three loads at most. I have always been unambitious; but that gay fellow there appears to have still less of ambition than I.'

In fact, at least in appearance, the *ranchero* regarded the convoy with a look of disdain; and whatever were his thoughts, it would have been difficult to detect any other expression on his impassive features than perfect indifference.

Meanwhile a squadron of lancers, destined for the escort, had much trouble in keeping the entrance free of spectators, of whom Gregorito was one of the most modest in expressing his desires. At last the work of loading was ended, the last mule walked out of the yard, and the detachment filed off to accompany the train. Gradually the crowd dispersed, and soon no one was left of all the curious gazers but the *ranchero*, who

seemed to be counting the mules one by one, and observing attentively each muleteer as he passed. At last the *ranchero* himself was in turn about to depart, when the *lepero* Gregorito came up, and asked permission to light his cigar at that of the cavalier. An animated conversation in a low tone took place between them; but I paid no attention to an incident apparently unimportant, and returned to my lodging.

I bought a horse for my valet, and made other preparations, intending to set off after the *conducta* on the following morning; but my plans were frustrated by the breaking out of a revolution—almost an everyday occurrence in Mexico. After twelve days of anarchy and bloodshed, which, effecting no real good, had opened prison doors to atrocious criminals, and caused a large amount of misery, order—or what was considered such—was restored. The *conducta*, which had gone into safe quarters during the commotions, I heard was again on the road; and having said farewell to my friends, I left Mexico for the last time one morning before sunrise, followed by my valet Cecilio.

After three days' riding we overtook the *conducta* a few miles beyond Puebla. In the first horseman to whom I spoke on reaching the escort, I had no difficulty in recognising a scapegrace of a soldier whom I had encountered several times during the fighting in the streets, and whom the fortune of war had raised to the post of lieutenant, which he had long coveted, under Don Blas, captain of the escort. After exchanging a few words, I rode forward to the side of the leader, and announced my intention of travelling with the convoy to Vera Cruz. He expressed satisfaction at the arrangement; but on my saying that I hoped to avoid the dangers of the route in his company, he shook his head and replied, 'I much fear that you will only fall from the frying-pan into the fire; for the late troubles have brought a few additional *gavillas* (robber bands) into the field, and I hear it is likely enough we shall have a crow to pluck with the rascals in the gorges of Amozoque. It is no longer the time as when, under a certain viceroy, the flag of Castile, floating above a silver convoy, was sufficient to protect it during the journey.'

'I trust,' was my answer, 'that a squadron of lancers commanded by you will be able to replace the Spanish flag.'

'May it be so!' rejoined Don Blas: 'but I am not blind to the dangers we may incur; at all events I shall do my duty.'

Although in a picturesque country, the journey, after a time, became somewhat monotonous; but I found an agreeable relief in the tales and songs of Victoriano, one of our muleteers. He had travelled the road for many years, and every halting-place afforded him a pretext for a recital. In the evenings, when the sentries were posted, and the stars shone out above our heads, the captain and myself listened to his animated narrations, or to his songs, accompanied by the guitar, with always new pleasure. On such occasions I pitied the travellers whom I saw fly past in the diligence, and congratulated myself on having joined the *conducta*.

We had travelled in this way for some days, when Victoriano recommended me to turn aside and visit the fort of Perote, offering to accompany me to the entrance, and added that I could rejoin the convoy at Cruz-Blanca, a village two leagues distant, where we were to pass the night. I followed the muleteer's advice, to the no small contentment of an officer, who was pleased to conduct me over the fortress as an agreeable interruption to the monotony of garrison duty. It was night by the time I reached our halting-place; I looked round for Victoriano, who had promised me an account of some extraordinary adventures for our evening's diversion, but he was nowhere to be seen. I learned, to my great surprise, that he had been missing for some hours: the whole camp was in alarm at the circumstance, as nothing short of a serious accident could have caused the absence of a man of such regular habits. While

lost in conjectures, an individual suddenly made his appearance, requesting an interview with the *arriero*. He informed us that Victoriano's horse having fallen, the rider had been so much hurt, as to be unable to continue his journey, and now lay under surgical treatment at Perote. He had come, he added, at Victoriano's request, to offer himself as a substitute until the other's recovery. Not having more men than were absolutely necessary, the *arriero* accepted the offer, perhaps without sufficient consideration; for the new-comer, though a robust fellow enough, had a face whose sinister expression did not inspire me with the same confidence as that of our absent muleteer.

The next day, before we had been an hour on the road, one of the mules lost his shoes, then a second, then a third, and long halts were necessary to replace them. Our new muleteer performed this task with much zeal and intelligence, to the great contentment of the *arriero*; but I could not repress my suspicions that all was not as it should be, and remarked to Don Blas that one so capable of refastening shoes might have been equally skilful in loosening them; the captain, however, treated my suspicions as pure chimeras. To make up for the delays, greater speed became necessary; but the mules seemed to have lost all their vigour, as though some enervating drug had been mingled with their food. The *arriero*, on whom all the responsibility rested, advised a halt, as night was coming on, accompanied by a dense fog; but the captain declared for pushing on to the place appointed for our bivouac. We were now entering on one of the worst parts of the route; our scarcely-distinguishable track lay through rugged ravines, bordered by lava rocks, and it became of the utmost consequence to prevent the mules from straying in the darkness. Sparks flew from the stones beneath the feet of the mule ridden by the *arriero*; and I could but pity him, as he galloped up and down counting and recounting the animals: their loss would be fatal to his fortune and his reputation. When night had fully set in, the captain, Don Blas, made two divisions of the escort: with one he placed himself at the head of the line of mules; the other brought up the rear.

As I rode cogitating on the probabilities of our position, my valet, Cecilio, came up and whispered—'Senor master, if you will take my advice, we shall not stay here a minute longer: strange things are going to happen.'

'And where to go,' I asked, 'when we cannot see two steps before us among these rocks and ravines? But what is the matter?'

'This, senor master, and perhaps I am the only one who has noticed it; Victoriano has just slipped himself in among us—that says nothing good—his fall was all a lie.'

'Are you sure?'

'I saw him; but that is not all: about a quarter of an hour ago, being in the rear, two cavaliers came by without seeing me, for I was hidden behind a lump of rock. One of them was mounted on a horse too magnificently black to be a peaceful traveller.'

'A magnificent black horse?' I interrupted, thinking of the *ranchero* who had so phlegmatically watched the departure of the convoy from Mexico.

Cecilio went on to state his conviction that the two strangers had insinuated themselves among our escort, and urged me to draw up until the train had passed. I refused, and spoke of advising the captain of what had occurred; but my valet was inclined to regard him as an accomplice of the interlopers. It was no time for discussion: I hastened forwards to warn at least the *arriero*. I was making my way by the side of some of the mules, when I observed a horseman a few paces distant, whom I took to be our new-comer of the night before. A minute later, the voice of one of the mule-drivers was heard through the darkness exclaiming, 'What means this? Eh, Victoriano, is it you? By Heaven, yes! and by what chance?'

No answer followed this interrogation: almost immediately the voice became silent. I shuddered: it seemed to me that I heard a suppressed gurgle, followed by the fall of a heavy body. I listened more attentively; the cold breeze alone mingled its sounds with the confused noise of footsteps. At the end of a few moments my horse made a sudden start, as though some fearful object had become visible through the gloom. Desirous of clearing up the terrible suspicions that crossed my mind, I took out my flint and steel, as if to light a cigar, as a solace under the freezing blast. For a moment I fancied myself the sport of a dream: by the light of the sparks I saw a number of men marching pell-mell among the mules and their drivers. Silent phantoms seemed to have risen mysteriously from the darkness to march at our side, some dressed in the red coats of the lancers, the others in the coarse frocks of the subordinates. All at once the tinkle of the leading mule's bell ceased; presently it sounded again in an opposite direction, and similar tones came from the ravines to the left of the route. I had seen enough, perhaps too much: we were beset by treachery. Whom denounce in such a fog, and on such a road? Whom trust in obscurity that confounded friends and enemies? Astonished at the strange discovery, I hesitated: then, at the risk of breaking my neck, I made a dash for the head of the convoy. It was already too late. A cord whizzing through the air fell upon me; my horse started forwards; but instead of being dragged violently from the saddle, and trampled under the horses' feet, as was intended, I felt myself retained by a fearful compression. A running noose, destined for me alone, had inlaced both horse and rider in the same fall. My right arm was held so tightly to my side as to prevent my cutting the cord; I dug the spurs into my horse's flank. The noble animal neighed, and strained his muscular haunches with irresistible vigour: I felt the noose grow tighter and tighter around me, then it relaxed; there was a bursting of girths, followed by an imprecation of rage, and in a moment I was free, before I had been able fully to comprehend the danger that menaced me. A report rang, a ball whizzed past my ears, and at the same instant arose a cry of alarm. Repeated discharges followed, and all became an indescribable confusion. The mules, deceived by the tinkling of the bell, which sounded from the most opposite directions, dispersed and jostled one another in their fright. The light of the musket-flashes showed the red coats of the lancers in disorder, as they fired at hazard into the impenetrable gloom; balls whistled past, and at times the despairing lamentations of the arriero sounded above the din.

My terrified horse had borne me some distance from the scene of combat; at last I forced him to retrace his steps. When I again reached the conducta, the struggle had ceased, the bandits had disappeared. Don Blas, who retained all his coolness, pressed my hand in silence: there was no time for questions. A man with a flaming torch in his hand rushed between us, imploring the captain's aid. By the light, I recognised the unfortunate arriero. Several soldiers, who had dismounted, cut down pine branches for torches, and we then saw a sad spectacle. The leading mule, robbed of its bell, stood surrounded by the others; for although deceived at first by the artifice of the robbers, the animals soon regained their usual instincts. Some were bleeding from large gashes. Two soldiers, also wounded, were endeavouring to stanch their blood with handkerchiefs; and in a hollow lay a poor muleteer writhing in agony. It was he who had recognised Victoriano, and he thus expiated the crime of having seen too much. After further search and counting, we ascertained, to the inexpressible consternation of the arriero, that five of the mules were missing. I suggested to Don Blas the propriety of immediate pursuit: the arriero added his intreaties, and offered half of the booty when recovered. Thus, whether an accomplice or not, the captain could not refuse to act. He fixed himself erect in

his saddle, selected a dozen of the best-mounted soldiers, and ordered them to provide themselves with pine branches, and follow him on the track of the robbers. It was one of those expeditions which eminently display American sagacity, and I persisted in accompanying the detachment.

The enterprise was perilous. As a measure of precaution, our torches were extinguished, and we turned off to the left, up the hard rocky steep. From time to time one of the men dismounted, and laid his ear to the ground; nothing, however, was heard but the rush of the wind. The stony soil, carefully examined by the light of a cigar, showed no traces of footsteps; and yet, by an inexplicable instinct, the soldiers felt assured that this was the path taken by the plunderers. By and by the clatter of hoofs abated: we were riding on softer ground, and soon distinct traces of two mules were discovered. All doubt as to the direction was now at an end; the soldiers, stimulated by the prospect of a rich prize, pushed forward with renewed spirit, though in strict silence. It would be tedious to relate all the incidents of this night. Sometimes all traces of the trail were lost; and at last we lit fires in a glade of the wood, and bivouacked till the morning. Just before daybreak a stray mule was met with, but completely divested of its valuable burden. Up to this moment Don Blas had manifested but little inclination for the pursuit: now the sight of the animal appeared to excite all his ardour, and he vented loud imprecations against the authors of the mischief, threatening to shoot the first that should appear. Our party broke up into twos and threes, to extend the search. The captain and I were riding together, when he picked up a fragment of one of the money-chests. He then begged of me to remain where I was, and not follow him, and quickly disappeared round a turn in the path. Shortly afterwards I heard a distant shot, followed by a feeble cry of distress. I fired both my pistols, and presently saw some of our soldiers approaching. A few words sufficed to explain matters: we galloped off in the direction of the report, and my fears were soon changed to certainty. The captain lay stretched on the grass, wounded by a ball in the breast. Broken chests and ripped-up bags were scattered about, but no enemy was visible. A glass of brandy, poured down Don Blas's throat, enabled him to speak. He told us that he had seen no one, but that he well knew who had fired the shot. An examination of the locality led to nothing that could clear up the mystery. We lifted the captain into his saddle, with a man mounted behind to support him, and set out to rejoin the conducta at La Hoya.

It was mid-day when we arrived; and here a new incident awaited us. Don Blas had scarcely been laid on the bed hastily constructed for him in one of the hovels of the village, when another party of soldiers came in with a prisoner bound. His dark features were half hidden by a handkerchief; yet I recognised a brigand with whom I had on a painful occasion been brought into contact in the interior of the country. The captain's pale cheeks became of a livid hue as soon as the captive was brought into his presence. Evidently they were not strangers. A recriminating parley took place, which ended by Don Blas declaring that the prisoner should be shot without further process.

'Shoot me!' said the other; 'surely you jest. I am not so deficient of protectors as you may think; and if it comes to that, I shall speak, senior captain—I shall tell!'—

It was then Don Blas's turn to tremble: he ordered the apartment to be cleared, and remained alone with the culprit: after an hour, the latter reappeared in the custody of the lieutenant Juanito. We stayed two weary days at La Hoya; on the third, the captain, for whom a litter had been constructed, determined on proceeding to Jalapa. The prisoner, closely bound, was mounted behind Juanito, and after riding a couple of leagues, I observed that the horse on which they rode, wearied perhaps by the double weight, loitered in the

rear. Curiosity kept me near them; they were talking in most friendly terms, and Juanito, whose shoes were in rags, was loud in praises of a handsome pair of boots worn by the other. Just at this moment we reached the summit of the heights of San Miguel, and I reined up my horse, the better to enjoy the magnificent prospect. After a short halt I again rode on, and overtook the two laggards; the belt by which the prisoner was attached to Juanito's body seemed to have stretched greatly in the interval: I fancied the soldier was conniving at an escape, and kept a steady eye upon his actions. All at once the belt fell to the ground in two pieces, the robber slipped from the horse's back, and took to flight; but with a rapid bound Juanito was upon him, and a shot from his carbine stretched the fugitive dead at his feet.

This mode of disposing of the robber, it appeared, had been preconcerted between the captain and his lieutenant. Juanito obtained possession of the coveted boots, and on my demand for an explanation, replied that Don Blas had arranged for an attack upon the bags of dollars with the man just shot: they were to divide the spoil. But the robbery had been effected by another band, who had thus forestalled the more traitorous conspirators. It was one of that band who had wounded the captain; and the latter, believing himself betrayed by his accomplice, had contrived his death as related. But when Don Blas was made acquainted with the true state of the case, the violence of his emotions brought on an internal hemorrhage, which, after a few moments of agony, terminated in death.

This event completely took away any inducement I might have had to remain with the conducta; I therefore halted until long after the litter, surrounded by lowered lances, in sign of mourning, had passed out of sight, and towards nightfall rode forward with my attendant to Jalapa.

MOTHERWELL AND HIS POEMS.

An able writer of the present day has attempted to prove the superiority of modern over ancient painting; but the like hypothesis has never been sustained in regard to the sister art—Poetry. The divinity of poetry is shown in her unchangeableness. She has no part either in social progress or social decline. The songs that charmed the rude ear of Greece, when bloodshed was a religious duty both of gods and men, are still the dearest music of the refined and Christian world. The ballads of our half-civilised ancestors, written when the language was as untutored as the men, are still the text-books of study, the 'well undeffiled' of inspiration.

The reason no doubt is, that in earlier conditions of society, more direct, and therefore more powerful, appeals are made to the natural feelings, which are the true stuff of poetry. As we advance in luxury, these may be overlaid with artificial refinements, and new schools may give form and method to conventional distinctions; but we never wholly forget our first loves, and never fail to reward with our smiles or tears those who strike the chord of nature. It has not been sufficiently noted that those epochs which imitate, as it were, the distractions of ruder times by civil war or other convulsions, have always been the most fertile in poetry; and that the Muse, even of the modern world, has sounded her loftiest notes amid public calamities or the clash of arms. There are always spirits, however, that have a leaning, irrespective of epochs and conditions of society, towards the simplicity and directness of old times; and when this is accompanied by a deep love of external nature, and the power of interpreting her forms and voices to the hearts of others, the result is true poetry.

Of such spirits was William Motherwell, a name to which criticism cannot award a higher place than in the first rank of minor poets, yet peculiarly worthy of our affection and regard. He was born in Glasgow in 1797, but received his earlier education in Edinburgh;

and there, while attending one of those humbler schools where boys and girls sat together on the same form, his poetical sympathies already began to develop themselves. His school companion, playmate, and friend, was a little girl called Jeanie Morrison, whom he never met again after their parting at the age of eleven. At fourteen, however, this girl still haunted him, and he tried to express in rude rhymes the gush of tenderness with which he turned to her gentle image. In later years the effort was resumed, and crowned by the production of a poem which no man of the most ordinary sensibility can read without a swelling heart and a moistened eye. In this exquisite lyric the little girl has evidently grown a woman in the expansion of the heart which contained her; and he wonders, with all the anxiety of a lover, whether he is as closely twined in the thoughts of the phantom of memory as she has been in his:—

'I marvel, Jeanie Morrison,
Gin I hae been to thee
As closely twined wi' earliest thochts,
As ye hae been to me?
Oh tell me gin their music fills
Thine ear as it does mine?
Oh say gin e'er your heart grows grit
Wi' dreamings o' langsyne?
I've wandered east, I've wandered west,
I've borne a weary lot;
But in my wanderings, far or near,
Ye never were forgot.
The fount that first burst frae this heart
Still travels on its way;
And channels deeper as it rins
The luve o' life's young day.'

It is proper to note, while mentioning the early love of a poet (herself quite unconscious of the romantic feelings she had inspired), that 'her hair was of a lightish brown, approaching to fair; her eyes were dark, and had a sweet and gentle expression; her temper was mild, and her manners unassuming.'

Motherwell's education was completed at the grammar school of Paisley, where he appears to have gone through the then curriculum of Scotland, inflicted upon all boys, without the slightest regard to their own tastes or destination in after-life—namely, five years of Latin, with the superaddition of Greek in the fifth year. At the age of fifteen he was placed in the office of the sheriff-clerk of Paisley, and after some years' service, was appointed sheriff-clerk depute, which situation he retained with credit till the close of 1829.

During this period he made some attempts to supply the defects in his education; and he collected a considerable number of volumes, chiefly in poetry and historical romance. In 1819 he edited the 'Harp of Renfrewshire,' a selection of songs and other poetical pieces, with some originals, and an introduction and notes; but it was not till 1827 that the work appeared on which his literary reputation mainly rests—the 'Minstrelsy, Ancient and Modern.' This work attracted considerable attention, and led to a correspondence with Sir Walter Scott on the subject of the curious old ballad of Gil Morrice. In 1828 Motherwell commenced the Paisley Magazine, and about the same time became the editor of the Paisley Advertiser; but in 1830 he accepted the editorship of the Glasgow Courier, which he retained till his death, five years later. With some contributions to the periodicals, a little volume of 'Poems, Narrative and Lyrical,' a joint edition with James Hogg of the works of Burns, which he did not live to complete, and his official struggles as a partisan of the expiring Tory party, this interval is filled up; and on the 1st of November 1835, William Motherwell, at the early age of thirty-eight, was suddenly called away by a shock of apoplexy in the very midst of the conflict of life.

Such is the brief and commonplace history of the man: that of the poet must be read in his works; and there we find the portraiture of a being as strangely different as it is possible to conceive from a provincial sheriff-clerk or a newspaper editor. Motherwell had

a deep and holy love for external nature—a love which, in a poet, can hardly be said to have *degenerated* into superstition, although he actually believed in the reality of the forms with which popular faith has invested her attributes. To his ear the forest wind, and the murmur of the river, were laden with the voices of spirits, and it was not the mere ghosts of memory that rose upon the darkness of the night. Conjoined, however, with these wild imaginations, there were the home-thoughts, the heart-yearnings, the social, friendly, family sympathies, which serve as a balance for the extravagances of fancy, and chain the dreamer to his true place upon the earth. Although involved for so many years in the strife of faction, and waging on his part a bitter and desperate party war, William Motherwell, we are told, when he was called from the world, left behind him not one personal enemy.

It may readily be supposed that the fancy which made itself a home in the supernatural world, turned away from the refinements and the philosophy of contemporary writers, to dwell with the singers of the Valhalla and the old balladists of his country. These he has not imitated in style and manner—he has identified his spirit with theirs; and no other modern writer we recollect has been so happy in that *directness* of effort, characteristic of the olden time, which unlocks by a single touch the fountain of sympathy. This is alluded to in an elegant criticism by Professor Wilson which appeared in 1833:—"All his perceptions are clear, for all his senses are sound; he has fine and strong sensibilities, and a powerful intellect. He has been led by the natural bent of his genius to the old haunts of inspiration—the woods and glens of his native country—and his ears delight to drink the music of her old songs. Many a beautiful ballad has blended its pensive and plaintive pathos with his day-dreams, and while reading some of his happiest effusions, we feel

"The ancient spirit is not dead—
Old times, we say, are breathing there."

'His style is simple, but in its tenderest movements, masculine: he strikes a few bold knocks at the door of the heart, which is instantly opened by the master or mistress of the house, or by son or daughter, and the welcome visitor at once becomes one of the family.'

In 1832 appeared the first edition in this country of Motherwell's poems, and fourteen years later the second, with many additional pieces; but in the interval two editions were published in America, where the poet, like Shelley and Keats, appears to enjoy a still higher reputation than at home. At length a third English edition has appeared, enriched with many additions from the author's manuscripts, selected by the taste of William Kennedy, himself a true poet, and a well-written memoir by Mr James McConehy of Glasgow.* To this narrative we have been indebted for the above particulars of the life of Motherwell; and we shall now draw upon Mr Kennedy for one or two specimens of the new matter in the volume.

The following song strikes us as having much of the raciness as well as tenderness of Burns:—

'He courted me in parlour, and he courted me in ha',
He courted me by Bothwell banks, among the flowers sae sma',
He courted me wi' pearlins, wi' ribbons, and wi' rings,
He courted me wi' laces, and wi' mony mair braw things;
But oh he courted best o' a' wi' his black blithsome ee,
Whilk wi' a gleam o' witcherie eist glamour over me.

We hied thegither to the fair, I rade ahint my joe,
I fand his heart leap up and down, while mine beat faint and low;
He turned his rosy cheek about, and then, ere I could trow,
The widdif' o' wickedness took aries o' my mou!
Syne, when I feigned to be sair floyed, sae pawkly as he
Bann'd the auld mare for missing fit, and thravin' him aje.

And aye he waled the loanings lang, till we drew near the town,
When I could hear the kimmers say—"There rides a comelie
loun!"

* The Poetical Works of William Motherwell; with memoir. By James McConehy, Esq. 3d edition: Greatly enlarged. Glasgow: David Robertson. 1849.

I turned wi' pride, and keeked at him, but no as to be seen,
And thought how dowie I wad feel gin he made love to Jean!
But soon the manly chiel, aff-hand, thus frankly said to me,
"Meg, either tak me to yoursel, or set me fairly free!"

To Glasgow Green I linked wi' him, to see the ferlies there,
He hirled his penny wi' the best—what noble could do mair?
But e'er ae fit he'd tak me hame, he cries—"Meg, tell me noo:
Gin ye will hae me, there's my lufe, I'll aye be leal an' true."
On sic an honest, loving heart, how could I draw a bar?
What could I do but tak Rab's hand for better or for waur?"

As a contrast, we may take the following, affording a fair specimen of the masculine character of his style:—

'THE KNIGHT'S REQUIEM.

They have waked the knight so meikle of might,
They have cased his corpse in oak;
There was not an eye that then was dry,
There was not a tongue that spoke.
The stout and the true lay stretched in view,
Pale and cold as the marble stone;
And the voice was still that like trumpet shrill
Had to glory led them on;
And the deadly hand, whose battle brand
Mowed down the reeling foe,
Was laid at rest on the manly breast
That never more mought glow.

With book, and bell, and waxen light,
The mass for the dead is sung;
Thorough the night in the turret's height,
The great church-bells are rung.
Oh wo!—oh wo!—for those that go
From light of life away,
Whose limbs may rest with worms unblest
In the damp and silent clay!

With a heavy cheer they upraised his bier,
Naker and drum did roll;
The trumpets blew a last adieu
To the good knight's martial soul.
With measured tread through the aisle they sped,
Bearing the dead knight on,
And before the shrine of St James the divine,
They covered his corpse with stone:
'Twas fearful to see the strong agony
Of men who had seldom wept,
And to hear the deep groan of each mail-clad one
As the lid on the coffin swept.

With many a groan, they placed that stone
O'er the heart of the good and brave,
And many a look the tall knights took
Of their brother soldier's grave.
Where banners stream and corslets gleam
In fields besprent with gore,
That brother's hand and shearing brand
In the van should wave no more;
The clarions call on one and all
To arm and fight again,
Would never see, in chivalry,
Their brother's mate again!

For a special purpose we add two stanzas from one of the poems of the older editions:—

'I AM NOT SAD.

I am not sad, though sadness seem
At times to cloud my brow;
I cherished once a foolish dream—
Thank Heaven 'tis not so now.
Truth's sunshine broke,
And I awoke
To feel 'twas right to bow
To fate's decree, and this my doom—
The darkness of a nameless tomb.

I grieve not, though a tear may fill
This glazed and vacant eye;
Old thoughts will rise, do what we will,
But soon again they die;
An idle gush,
And all is hush,
The fount is soon run dry;
And cheerily now I meet my doom—
The darkness of a nameless tomb.

In these verses Motherwell foretold what has hitherto been a truth. He was buried in the Necropolis of Glasgow, and the spot is undistinguished even by a headstone bearing his initials! A considerable sum of money was raised by subscription among the friends of the deceased poet; but it was no more than enough to succour those whom Motherwell had been obliged to leave to the charity of his friends. It is high time that the reproach of the nameless tomb were wiped off, and

we trust to see it immediately looked to. The following eloquent and elegant appeal from a brother poet (which closes the volume) will have more effect than all we could say on the subject:—

'LINES WRITTEN AFTER A VISIT TO THE GRAVE OF MY FRIEND WILLIAM MOTHERWELL, November 1847.

Place we a stone at his head and his feet;
Sprinkle his sward with the small flowers sweet;
Piously hallow the poet's retreat!
Ever approvingly,
Ever most lovingly,
Turned he to nature a worshipper meet.
Harm not the thorn which grows at his head;
Odorous honours its blossoms will shed,
Grateful to him, early summoned, who sped
Hence, not unwillingly—
For he felt thrillingly—
To rest his poor heart 'mong the low-lying dead.
Dearer to him than the deep minster bell,
Winds of sad cadence at midnight will swell,
Vocal with sorrows he knoweth too well,
Who, for the early day,
Plaining this roundelay,
Might his own fate from a brother's foretell.
Worldly ones treading this terrace of graves,
Grudge not the minstrel the little he craves,
When o'er the snow-mound the winter-blast raves—
Tears—which devotedly,
Though all unnoted—
Flow from their spring in the soul's silent caves.
Dreamers of noble thoughts, raise him a shrine,
Graced with the beauty which lives in his line;
Strew with pale flow'rets, when pensive moons shine,
His grassy covering,
Where spirits hovering,
Chant for his requiem music divine.
Not as a record he lacketh a stone!
Pay a light debt to the singer we've known—
Proof that our love for his name hath not flown
With the frame perishing—
That we are cherishing
Feelings akin to the lost poet's own.

WILLIAM KENNEDY.'

A GLANCE AT THE HISTORY OF POPE PIUS IX.

AMONG the continental rulers whose wavering fortunes have fixed the eyes of all Europe during the last few eventful months, none have awakened such universal admiration, or so deep a sympathy, as Pope Pius IX. Even those who disavow his creed, revere the honesty of his faith; and although some may deny him the appellation of a *great* man, none will question his being a *good* one. At the present moment, when he is a fugitive from Rome, and his horizon clouded with cares and perplexities, it is curious to look back upon the brief period of his popularity, and to remember the day upon which he was installed as sovereign pontiff amid the cheers of a countless and enthusiastic multitude. It is more than probable that the imposing forms then observed, and which have been handed down to modern Europe, a last relic of the middle ages, may, in this day of reform, be swept away with the besom of destruction, and that henceforth they shall only live in the pages of history, or in the memory of man.

Let us say a word first about the obsequies of Gregory XVI. No sooner had the cardinal chamberlain verified the death of the pope by striking his head gently three times with a hammer, than the event was announced to the inhabitants of Rome by the great bell of the capital, and to all Catholic courts of Christendom by their respective ambassadors. A few days afterwards, the embalmed body, clothed in pontifical garments, was borne from the Quirinal to the Vatican on a splendid litter, carried by white mules, which were caparisoned in black, and escorted by torch-bearers, dragons, Swiss guards, trumpeters, and artillerymen, accompanied by seven pieces of cannon.

To describe the imposing effect of this military and religious convoy would be as difficult as to reckon the multitude which thronged around the lifeless body,

which, clad in white, was borne aloft far above the heads of the crowd beneath. The couch of state was prepared in the Sistine Chapel, where it rose up as high as the frescos of Michael Angelo. Picture to yourself a colossal monument of velvet and silk, gold and silver, illuminated by a blaze of light. Gregory XVI. reposed on its summit, bearing the tiara on his head and the crozier in his hand. One might almost have thought that he still breathed. After three days and nights of unceasing chants and psalmody, came another convoy and another procession, as imposing as the first. This time the body was borne into the great Basilica of St Peter's, and an alcove was prepared for its reception, not less splendidly mournful than the couch of state. Here the holy father was laid in an inclined position, so that all could behold him from the tiara to the shoe-strings; and the multitude were admitted to kiss his feet, which, for this purpose, were suffered to project beyond the iron grate. This exposition and kissing of the feet lasted for three days, during which the church was constantly full. On the fourth day (the seventh of the obsequies) the body was deposited in the middle of the church, under the mausoleum where his predecessor had hitherto lain, the latter being now conveyed to those vaults whither Gregory in *his* turn will one day be borne.

The funeral oration, the last act of this melancholy drama, was pronounced in Latin, after which the *guardia nobile* laid aside their mourning; the mace-bearers bore away their maces; the cardinals attended the 'mass of the Holy Ghost,' and went into conclave to elect a new pope.

The word *conclave* defines admirably the state of seclusion and secrecy in which the sacred college is kept during this important period. The cardinals shut themselves up in the Quirinal with their aids and their physicians. Once there, they cannot quit the palace without a pope. Each day may be seen their respective equipages bearing along their dinner; sometimes a *poached egg*, escorted by *four horses* and as many *piqueurs*!

These repasts are conveyed through a trap-door, the only mode of communication permitted with the outer world. All the doors and windows are hermetically sealed; each voter inhabits a separate cell, and they only meet in the central chapel for the election of a pope. There are three modes of election—that by acclamation, by compromise, and by scrutiny. The latter is the most usual, and its form is as follows:—The dean of the sacred college votes first. He takes out of a silver basin a balloting-ticket, prepared beforehand for the purpose, and fills it up in presence of the cardinals, so that all may see his act, and yet none can read what he has written upon the parchment. Each candidate goes through the same formality. The voter next holds up his ticket between his thumb and forefinger, and turning towards the altar, utters aloud the following oath:—'I take God, who is my judge, to witness that I elect him whom I deem most worthy of being pope!'

Upon the altar is placed a large silver chalice, in which the voters place their tickets; and afterwards the names are read aloud by one of the *scrutatori*, each of the cardinals holding a printed list, on which he notes down the names as they are uttered. If, in this first operation, one of the cardinals has obtained a sufficient number of votes, he is immediately declared pope; but for this purpose two-thirds of the votes are required. Roman affairs usually progress but slowly, and conclaves have been known to last for five months. The affairs of Italy being at this moment rather in a perplexed state, it was suspected that the election would prove a dilatory one; and I went the first evening, out of mere curiosity, to look at the *fumata* upon the Piazza del Quirinal. I must tell you what is meant by this word *fumata*. At the end of each day's scrutiny, if no one has been so fortunate as to obtain two-thirds of the votes, the balloting-tickets are burned in a stove placed behind the altar, from whence the smoke issues by a pipe which is visible on the Piazza. If, on the contrary, any one has obtained the majority, the tickets are preserved with care, and there being no smoke without fire, the chimney of course

gives no sign of combustion. You may conceive with what impatience the expected signal is looked for by the crowd who assemble each evening in the Piazza. Thousands of eyes are fixed upon the roof of the palace until the solemn moment of the scrutiny. If a faint column of smoke is then seen to rise, the Romans wish one another a *Felice notte*, and go to bed: they have no pope, and the successful scrutiny is yet to come.

On the first day of the conclave a multitude were assembled to gape at the fumata; and we saw it at the expected time rise up slowly over the roof of the palace. The next evening there were comparatively but few whom curiosity led to the spot; for 'there would be so many opportunities,' every one said, 'of seeing it again.' Judge, then, of our surprise when the solemn hour arrived without bringing with it a single curl of smoke.

'Surely,' said the lookers-on, 'there must be some unforeseen delay;' and every eye was fixed upon the palace in impatient expectation. Minutes sped on, and were growing into hours; still no fumata. And yet how was it possible to conceive that a pope should be elected in eight-and-forty hours? Suddenly are heard loud knocks of a hammer behind the partition which closed in the *loggice* (so is the balcony of the Quirinal called). The partition falls, piece by piece, and the master of the ceremonies appears in the balcony, clad in his state costume, and bearing a cross in his hand. He announces, in a sonorous voice, to the Roman population, who by this time had come thronging into the Piazza, the nomination of the new pope, in these words:—'I bring you joyous tidings: we have for our pope the most eminent and most reverend Cardinal Mastai Ferretti, Archbishop of Imola, who has chosen the venerated name of Pius IX.' Immediately the air was rent with acclamations, and there seemed such unbounded enthusiasm amongst the people, that I began to inquire among my neighbours whether the new pope had any special claim to popularity; and I learned that, about thirty years before, he had been one of the handsomest and most fascinating gentlemen in Italy; that he was on the eve of marriage with a lovely and noble lady, to whom he was tenderly attached, when death suddenly deprived him of his treasure.

Her loss occasioned him such deep sorrow, that he renounced the hopes and pleasures of the world, and became a priest. He had, until then, borne the epaulettes of the Austrian service, and was distinguished among his companions by his proud and gallant bearing. Now his martial ardour was exchanged for a martyr's zeal, and he went as a missionary to preach the Gospel amongst the tribes of South America. In vain did he expose himself to the toils and perils incident to this life of self-devotion; he survived them all; and after an absence of some years, returned to Italy, whither he had been recalled by his superiors. Here his worth and merit soon became known. He was shortly afterwards appointed bishop of Imola, then archbishop, next cardinal, and now, after a single scrutiny, he had been elected pope at the age of fifty-four years!—a circumstance almost unprecedented in the annals of the sacred college.

The popularity of the new pontiff was still more apparent on the day of his coronation. On that morning his name was repeated with the wildest enthusiasm by the vast masses of people who thronged the streets to witness the solemnities of the day. Pius IX., escorted by the conclave in scarlet robes, was borne upon the *gédia* from the Quirinal to St Peter's, and from St Peter's to the Vatican. There he assumed the episcopal habit, the cope, and the silver mitre; and by the sound of the cannons of the castle of St Angelo, in the midst of all the clergy, the army, and the Roman people, he made his solemn entry into the Basilica, hung with rich damask fringed with gold; gave his feet to the cardinals, archpriests, priests, and monks to kiss; crossed the immense nave amid the clang of trumpets, which resounded from the galleries on either side; looked at the thrice-burned tow, which announces to him the vanity of all earthly glory (*sic transit gloria mundi*); and then placing himself once more on the *gédia*, over which was borne the papal canopy, he

went to receive the tiara* in the grand balcony of St Peter's, in the presence of an innumerable population, which crowded the pavement beneath.

Often as this ceremony has been described, it is perhaps impossible to realise a solemnity which has no parallel on earth. Picture to yourself the moment of the benediction, '*Urbi et Orbe*' (for Rome and for the universe), this living mass of human beings stretching out as far as the eye could reach; these thousands of priests and monks clad in all the rich and varied costumes of the middle ages; this sacred college, and this court, wearing scarlet robes; this mingled pealing of bells and salvos of artillery; and in the midst of all this joy and splendour, the pontiff covered with jewels, his tiara on his head, his sceptre in his hand, standing alone far above the kneeling multitude, and stretching out his arms towards the four cardinal points, blessing the family of Christ in all parts of the world.

The enthusiasm of the Romans did not end with these splendid and solemn ceremonies. All men spoke of Pius IX. as being the dispenser of no empty blessing; but that he came to bear liberty to the nations, redress to the wronged, and consolation to the afflicted. Such, truly, was his ambition; and despite of recent events, we may not say that his desire has been altogether unfulfilled. During the two years and a-half which have elapsed since that gorgeous pageant, how many deeds of goodness and mercy have crowned his daily life! The liberation of the unhappy Jews from their prison-like abode in the Ghetto is in itself a noble monument of his enlightened spirit. During that period, whosoever misery appeared amongst the Romans, there also was Pius IX. to be found, lending his best endeavours to relieve or to allay it.

On one occasion, when a certain district near Rome was deluged by the overflowing of the Tiber, so that the wretched inhabitants were flooded in their dwellings, and they themselves exposed to the complicated miseries of want, and of exposure to the inclemency of the weather, tidings of their misfortune reached the pontiff's ear. Not content with sending some aid to the sufferers, he resolved to inspect their condition himself, and mounting his horse, rode off briskly to the scene of distress, followed by the cardinals, who, accustomed only to lounge luxuriously in their coaches, inwardly cursed the active benevolence of their new pope, which would not suffer him to indulge in lazy benevolence. Pius IX., on his accession to the papal chair, found himself placed in circumstances so intricate and perplexing, that it would have required the highest genius to direct them to a happy issue. By nature benevolent and firm, with a strong sense of justice, possessing an intelligent and cultivated mind, he longed to give freedom to his people, and to ameliorate their condition morally as well as physically. At the same time, his attachment to the church was ardent and sincere; and whilst he was full of indulgence towards his people, he was inflexible in his reform of ecclesiastical abuses, and was the practical opponent of all priestly tyranny. Many anecdotes corroborative of this assertion have been afloat in the world. We will relate but one, which has reached us from an authentic source. A rich Italian noble, desiring in his old age to atone for the sins of his youth, was advised by his confessor to bestow the bulk of his property on the church. He had two nephews, who expected to inherit his fortune, but, swayed by priestly counsel, he assigned to each of them only a small annuity, and made a will, disposing of his vast wealth in favour of the priest who should chance to say the first mass for his soul on the day of his funeral. This will was safely deposited with the proto-notary of the Holy See. The nobleman soon afterwards died, and the proto-notary, on opening his will, immediately communicated its contents to the sovereign pontiff. It was late at night when this news reached him; but the fol-

* The tiara, or triple crown used on this occasion is that with which Napoleon presented Pius VII. Its foundation is of white velvet: the three crowns are composed of sapphires, emeralds, rubies, and pearls. On its summit is one large emerald, surmounted by a cross of diamonds. The value of the tiara is estimated at £18,000.

lowing morning he rose before the dawn, hastened to the chapel where the funeral rites were to be performed, ordered the doors to be opened, and offered immediately the sacrifice of the mass. Having thus constituted himself the universal legate, the holy father at once sent for the nephews of the deceased, and yielded into their hands the whole of their uncle's fortune.

With such dispositions, it may readily be conceived that Pius IX. was as bitterly hated by one body of his subjects as he was beloved by another. Among his fiercest opponents were the cardinals and the Jesuits; and their enmity was so generally known, that the populace, who used to follow him in crowds as he walked along through the streets of Rome, would cry aloud, '*Santo Padre, guardasi dal bouone.*' They feared that he might be poisoned, as more than one of his predecessors had been, at the festal board. The pope was eminently a favourite amongst the female portion of his subjects, who, heretofore, had been excluded from the Quirinal, as if they were accursed beings; but Pius IX. felt that the whole human race equally claimed his care, and no petitioners were ever sent away unheeded from his gates, whatever might be their rank or sex. A clamour was raised on this subject by narrow-minded and evil-thinking men; but the holy father pursued his course of kindness and courtesy, without being over-anxious concerning the opinion of his detractors. Among those of the fair sex who requested leave to pay him their homage, was Fanny Elsler, the celebrated *danseuse*, who, on her arrival at Rome, humbly solicited the honour of kissing his holiness's feet. Her profession would doubtless have insured a refusal from any other pope; but the good man graciously assented to her wishes; and she who had heretofore gloried only in the homage which everywhere awaited her, now bent her knee before the pontiff as a humble and obedient subject. By way of showing her respect, she had dressed herself magnificently, and put on all her diamonds; and however questionable the taste which dictated this display, it did not seem displeasing to the pope, who accepted it as a mark of homage to the dignity of his office.

A few days before, he had received the queen of Holland, whose toilet was far more simple than that of the fair *danseuse*. This was perhaps not the less gratifying to him, as royalty thereby signified its humility in the presence of one who claimed supremacy over the sovereigns of the earth.

The first act of Pius IX. was to grant an amnesty to those who had been banished from their country on account of political offences. At first the emigrants viewed with suspicion this act of clemency; but after a while, even these exiled patriots learned to confide in his honesty of purpose, and they flocked around him to the number of seven or eight hundred. He received them cordially, and encouraged the expression of their liberal opinions. But he was too clear-sighted not to perceive that their desires and expectations exceeded his power—nay, perhaps his intentions of reform.

The letter of a distinguished Italian refugee, dated from Rome in January 1847, just after an interview with the pope, of whose benignity and good intentions he speaks with enthusiasm, thus describes his first impressions of Pius IX.:—"I think the pope is a rare and an evangelical man. I found as much facility in expressing my opinions to him as if he had been only my equal. We spoke long on the political condition of the country, on its industrial resources, and on the liberty of the press. After much thoughtfulness of aspect and manner, he approached me with an air of confidence. "Son," said he, "I cannot totally change the form of government!" Here was the seed of future dissensions. Pius IX. was sincere in his desire to reform civil as well as ecclesiastical abuses, but he was not prepared to grant the institutions which were desired by his people. His first prepossessions were all in favour of freedom and progress. He granted liberty of the press, and became quickly alarmed at its license: he appointed a civic guard, and was surprised to find that its ardour could not be confined within the limits he had assigned to it: he named

a council, consisting chiefly of laymen, who were to assist him in the administration of civil affairs, and listened with dismay to the cries for a representative assembly, who should have the right of governing the country as well as of advising its chief.

Whether the pope was unequal to the task now assigned to him, of guiding the vessel of St Peter amid the storms of a revolutionary period, or whether the task he had undertaken was one too difficult for the ablest mortal to accomplish, we do not pretend to decide. Suffice it to say, that early in the past year symptoms of reaction began to appear. The Romans became more exacting, and their sovereign less willing to concede the privileges they desired. The appointment of Rossi, an Italian by birth, but a foreigner by prejudice as well as habit, to the post of prime minister, exasperated the people, and diminished the pope's popularity. Early in November matters came to a crisis. The Eternal City becoming the focus of popular excitement and disturbance, Rossi called to his aid a body of carabinieri, whose entrance into Rome, with the professed purpose of guarding the avenues to the Chamber of Deputies, and thus influencing their councils, roused the people into frenzy.

The minister was so unwise as to use insulting language with reference to the democratic party, and in a moment of unbridled fury, a dagger was plunged into his neck at the very door of the Palace of Legislature. This deed of violence took place on the 13th November. On that evening a vast multitude paraded the streets of Rome, preceded by the Italian flag, and singing in chorus, 'Blessed be the hand that felled the tyrant!' Next morning an assemblage of thirty thousand people, consisting of soldiers as well as citizens, marched to the Chamber of Deputies, to require that the latter might demand of the pope a democratic ministry, as well as certain concessions, the chief of which were, the recognition of Italian nationality, and the convocation of a Constituent Assembly. The deputies having joined the cortège, they proceeded to the palace of the pope, who, in reply to their demands, said he would grant nothing to violence. This inflamed the populace, who threatened to set fire to one of the gates of the Quirinal if the pope continued obstinate, and vowed that they would, after taking the palace by assault, shoot every one of its inmates, the pope only excepted. A small body of Swiss continued faithful to their duty, and kept up for some time a brisk firing from the windows; but what were they against six thousand civic guards and troops of the line, who were ranged in order of battle before the palace, with the cannon levelled against the principal entrance?

Pius IX. finding himself thus abandoned and helpless, resolved to prevent an effusion of blood by yielding to the demands of the multitude: he consented to receive Mamiani and his colleagues as ministers, and referred their other demands to the Council of Deputies. He capitulated in the name of the Swiss, on condition that their lives should be spared, and they were instantly sent out of the city, their posts being occupied by the civic guards.

Thus was the pope now in the hands of his enemies, a prisoner within his own palace, deserted by all save the diplomatic corps, who gathered around him in his extremity, to offer him the security to be derived from their presence. It is said that on first realising his fallen state, he burst into tears; and this has been imputed to him as pusillanimity; but it ought to be remembered that the feelings of Pius IX. were not those of an ordinary ruler under similar circumstances. A military despot, or a merely civil ruler, might have deemed it mercy, by the sacrifice of some human lives, to stem the torrent of revolution in its earlier stages, but he felt himself the guardian of their spiritual safety; and those tears which he is supposed to have shed, may have sprung from far deeper sources than those of cowardice or disappointed ambition. That he was not deficient in moral courage, is proved by the fact, that even at the time of his imprisonment, he resolutely refused to allow his name to be attached to any of the deeds of the government, and declined even to receive, according to custom, the daily reports of the officer of the guard.

During eight days he continued a captive in the Quirinal, that palace in whose balcony his advent to power had so recently been announced, amid the plaudits of a people intoxicated with joy at so auspicious an event. On the 24th of November he contrived to escape from the palace, in the suite of the Count de Spaur, the minister of Bavaria, whose livery he assumed for that purpose, and afterwards accompanied him to Gaeta in the disguise of his chaplain. It is said that at one moment he was in peril of being recognised, in an unfriendly village, but for the presence of mind displayed by the Bavarian minister's lady (an Englishwoman), who, pretending to be incommode by the heat, desired the blinds of the carriage to be quickly drawn down.

It was some time before the escape transpired. When it did, the news fell like a thunderbolt upon the Romans. A note was left by his holiness for the minister Galetti, intreating him not only to spare the palace, but to protect the several persons in it, who were totally ignorant of his resolution to escape, and urging him to promote the quiet and safety of the city.

The town of Gaeta being situated on the very borders of the Roman states, it is evident that Pius IX. has not abandoned his hope of restoration; for many other more inviting residences have been offered to him; but he has expressed his desire of remaining where he is. There he is surrounded by the homages of the Neapolitans, whose royal family vie with their subjects in doing him honour. The foreign ambassadors and the cardinals have also gathered round him; and a deputation from Rome has requested an audience to supplicate his return; but the embassy was not suffered to cross the confines of the Neapolitan dominions; whether by desire of the pope, or by the command of the king of Naples, it is not very easy to ascertain.

The year on which we are now entering will doubtless unfold a new page in the eventful history of Pius IX. What may be the future complexion of his destiny we shall not presume to surmise. Some aver that he is on the eve of allying himself with that despotism which has hitherto been so alien to his feelings and principles; others foretel that he will re-enter the Eternal City, shorn of his temporal power, and merely in the capacity of ecclesiastical ruler of a Roman republic. Gladly do we leave the issue of present events to that Providence which guides and overrules the circumstances of national as well as domestic life; and we shall now close this brief sketch of Pope Pius IX. by earnestly desiring that he may prove both wise and firm at the present important crisis of his history.

POPULAR MEDICAL ERRORS.*

WHEN I commenced practice as a surgeon, I found that popular notions on medical subjects exercised a considerable influence on the minds of many well-educated people, and to some extent interfered with their ready concurrence in the views of their medical advisers. In some cases I took pains to explain what are considered the more correct and scientific views; but I was not always successful in combating notions which seemed to have the authority of ages, and the suffrages of all mankind in their favour. Thus I had frequently the mortification of finding my explanations received with incredulity and distrust, and at times even with an open denial, when an experienced nurse or aged matron conceived her wisdom to be called in question. At length the idea suggested itself of noting down the common ideas entertained on many of the subjects in question, with a view to inquiring how far they may be deserving of credit. It could not well escape me that many doctrines, which had long been regarded as vulgar errors, have again been received into favour, or have been found to contain the germs of valuable discoveries.

There could not well be a more striking instance of

this than the introduction of the vaccine inoculation. Dr Baron states that whilst Jenner was a young man, engaged in pursuing his professional education at the house of his master at Sodbury, a young countrywoman applied for advice. The subject of the small-pox was casually mentioned in her presence, when she immediately remarked, 'I cannot take that disease, for I have had the cow-pox.'^{*} Now it was a popular notion in the district that those who had been the subjects of the cow-pox were not liable to the small-pox. The idea, ridiculous as it might seem to superficial thinkers, engaged the attention of Jenner, and he set himself about inquiring into the truth of the matter, and by his persevering and patient inquiries, accomplished the greatest discovery which has perhaps ever benefited mankind.

In one of Jenner's note-books of 1799, he says, 'I know no direct allusion to this disease in any ancient writer, yet the following seems not very distantly to bear on it. When the Duchess of Cleveland was taunted by her companions, Moll Davis (Lady Mary Davis) and others, that she might soon have to deplore the loss of that beauty which was then her boast (the small-pox at that time raging in London), she made a reply to this effect, "That she had no fear about the matter; for she had had a disorder which would prevent her from ever catching the small-pox."'[†]

In 1646 Sir Thomas Browne, the author of the 'Religio Medici,' wrote his work called 'Inquiries into Vulgar and Common Errors.' In the preface, the author speaks of the difficulties of the undertaking in a style which is both quaint and amusing. 'We hope,' says he, 'it will not be unconsidered that we find no open track or constant manuduction in this labyrinth; but are oftentimes fain to wander in the *America* and untraveller parts of truth. And therefore we are oftentimes constrained to stand alone against the strength of opinion, and to meet the Goliath and giant of authority with contemptible pebbles and feeble arguments, drawn from the scrip and slender stock of ourselves.' Some of the errors which this grave writer set himself about exploding with so much appearance of erudition, would only make us smile in these days of science and learning. Thus he controverts the absurd idea that a bear licks her cubs into shape, and endeavours to show how it is to be explained 'that a man becomes hoarse or dumb if a wolf have the advantage first to eye him.'

It seems, however, that Sir Thomas Browne was himself by no means superior to the prejudices of his own day. 'It is singular,' says one of his biographers, 'that notwithstanding his zeal to detect old errors, he seems not very easy to admit new positions; for he never mentions the motion of the earth but with contempt and ridicule, though the opinion which admits it was then growing popular, and was surely plausible, even before it was confirmed as an established truth by later observations.'[‡]

Many of the expressions commonly made use of in speaking on medical subjects might be changed with advantage to suit more rational views. Some of them, it is true, are only used metaphorically, and it would not therefore be fair to censure them too rigidly. We hear of the seeds of a disease lurking in the system—of a complaint flying about, and finally settling upon a particular organ; and these phrases, though for the most part used vaguely, have to a certain extent a bias over the thoughts. There can be but little doubt that very many of the vulgar opinions were in reality at one period the established doctrines of the day; for in this, as in many other cases, it has happened that the better-informed part of mankind have forsaken the doctrines they promulgated by the time the people became familiar with them.§ It is the same with the fashions

§ They are the fossil words and phrases which show us the vestiges of decayed opinions.

* Communicated by Mr James Bower Harrison, surgeon, of Broughton, near Manchester.

of our dress, and the pronunciation and choice of our words, the generality of mankind being of necessity more slow both to adopt and reject particular usages and customs. To a certain extent, therefore, they furnish a sort of salutary drag on the more volatile part of society. Some of the old notions which have already become sufficiently exploded are still embalmed, as it were, in our language and common forms of expression. We speak of a 'tender heart' and a 'true-hearted friend,' as though this organ were the seat of the mind. Then we read in Scripture of 'bowels of compassion;' and the words 'melancholy choler,' and the 'spleen,' when used for ill-temper, are farther examples of words taking their origin in the theories of a former day.

Much ingenuity and learning might be displayed in searching out and collecting into a focus the peculiar notions of former times; but this would be a work of considerable extent, and more curious and entertaining than useful. For my part, I wish to comment upon the opinions which now actually influence the minds of the public, or give a colouring to their views of disease. Simple as many of them may seem, they are the secret springs which determine the views of people, often in opposition to the dictates of their professional advisers. On this account, therefore, they must be treated with respect—a respect which they deserve from their influence, if not from their justness.

I have purposely, then, brought forward the opinions which I have found to be the most prevalent and the most influential, without any reference to their plausibility or ingenuity, and in preference to the discussion of others which might have admitted of more scope for entertainment or for professional research. On this account I must be excused for speaking of many things which are simple, and perhaps ludicrous and commonplace, and also for passing by many subjects which are rich in matter for curiosity and entertainment, as well as the display of such literary industry as might be devoted to them.

I shall now proceed to the consideration of the several common errors which have presented themselves to my mind, making on each a few very brief remarks, but such as I imagine may be sufficient, without being tedious.

I am quite aware that there are very many (not to speak of professional readers) to whom all these explanations may be altogether unnecessary, but I am sure I shall have their indulgence if the comments which I make are only acceptable to others. To all, notions which are common must, as such, be of some interest, whatever may be their absurdity, and the remarks made on them may at least serve to connect them together. In the course of this paper, then, I shall have to introduce many commonplaces; but this, it must be remembered, is inseparable from the subject. I may also state that I have purposely chosen to treat the subject in a plain, and somewhat colloquial style; for it seems to me that common ideas are best explained in a familiar manner, and that popular notions are best embodied in the language in which they are usually delivered.

Lunatics.—There is a common notion that lunatics are influenced by the moon. The term lunatic was no doubt given to insane people from the supposed influence of the moon in producing madness. This opinion is in some degree preserved by the continued employment of the term *lunatic*, as well as by that fondness for the marvellous which is so common to mankind. Even at the present day, people will shake their heads and allude significantly to the full of the moon—'Poor Mr So-and-so,' they will say, 'is a little off the cock just now—a little wrong in the upper storey; but then it is the full of the moon next Thursday.' There does not appear to be any real ground for the belief that the moon exercises this baneful influence on the human mind, although it is acknowledged that insane people are usually somewhat more than ordinarily restless at the full of the moon. The celebrated French writer Esquirol attributes this to the effect of the increased light, and

states that the break of day occasions a similar agitation. 'Light,' he asserts, 'frightens some lunatics, pleases others, but agitates all.'²⁸

Of Seasons.—There is a very common, and very old notion, that what are called *cooling medicines* should be taken at particular periods of the year, especially in the spring. Every practitioner will occasionally be consulted on this subject, and very often a great disposition is shown by medical men to fall in with popular views. Many a poor child has been condemned to a pot of brimstone and treacle merely because it was the spring-time. I imagine parents are not always ready to carry out these views in their own cases. Hippocrates advocates such a system in his 47th aphorism, section vi. 'If bleeding or purging be requisite,' says he, 'spring is the most convenient time for either.' He repeats the same view in other places. There was a great deal of importance attached to seasons in the treatment of diseases by the old medical authorities; but we find very little on this subject in our best modern works. For my part I don't see why we should take physic unless we are ill. The public have very curious, and, I should think, very ill-defined ideas of cooling physic, and of medicines for purifying the blood. That the ancients set considerable importance on seasons, will appear from the most casual inspection of their works. Thus *Ætius*, in his directions for the cure of the gout, laid down a distinct regimen for each month. 'In September, the diet should be wholly milk; in October, garlic must be eaten; in November, bathing is prohibited; in December, cabbage; in January, the patient should take a glass of pure wine every morning; in February, he must not eat beet; in March, he must mix sweets both with his eatables and drinkables; in April, he must refrain from horse-radish; and in May, from the fish called polypus; in June, he must take cold water in the morning; in July, abstinence must be practised; in August, he must not eat mallows.'[†]

Hair.—That hair turns gray in a single night.

In a popular but able treatise on diseases of the skin (by Erasmus Wilson),[‡] this subject is alluded to in the following terms:—'Much less can I give credit to the bleaching of the hair in a single night or a single week. The first step in the change may have been made in a single night, and on that night week the whole of the hairs of the head may have become white at their roots; this is perfectly possible, and the only reasonable explanation of the circumstance. Thus we learn that Marie-Antoinette became gray in a short period, as did the unfortunate Mary Queen of Scots.' He alludes to the passage in the 'Prisoner of Chillon,' showing that the error has the weight of poetical authority in its favour—

'My hair is gray, though not with years,
Nor grew it white
In a single night,
As men's have grown from sudden fears.'

After proceeding to relate several amusing cases of this reputed bleaching of the hair, he goes on to speak of another common error with respect to the hair:—'A prevalent belief, strengthened by the opinion of several modern French writers on this subject, is, that the hairs grow after death. It is true that they lengthen, but their lengthening results from the contraction of the skin towards their roots, and not from the continuance of a vital process after the death of the individual. But the older writers outstrip the moderns in invention; for in the "Philosophical Collections," Wulferus gives the account of a woman buried at Nuremberg, whose grave being opened forty-three years after her death, there was hair found issuing forth plentifully through the clefts of the coffin, inasmuch that there was some reason to imagine the coffin had some

§ Op. cit. p. 100.

time been covered all over with hair. Mr Arnold gives "the relation of a man hanged for theft, who in a little time, while yet he hung upon the gallows, had his body strangely covered over with hairs."

Jaundice.—There is a common saying (I will scarcely venture to call it an opinion) that jaundiced people see things yellow.

How common to hear of the jaundiced eye, as another word for prejudice! it being of course implied that the subject sees through a coloured medium. It occasionally does happen that a person having the jaundice sees objects yellow, but this is rather the exception than the rule, and seems to be dependent on some enlarged and tortuous vessel crossing the transparent part of the eye when the vision has been previously impaired by some disease. Dr Watson mentions this subject in his valuable lectures on the Practice of Physic.* 'You are aware,' says he, 'of the vulgar notion that to a jaundiced eye all things appear yellow. It is an old notion, for we find it expressed by Lucretius—"Lurida præterea flunt quæcunque tuentur arquati." Heberden was disposed to regard this as a mere poetical fiction, but certainly it is sometimes, though very rarely indeed, a fact.' He goes on to say that he has been assured by a medical man of his own acquaintance that objects appeared coloured to him in his own experience of the complaint; also that Dr Mason Good saw things yellow when he was jaundiced. Dr Elliotson also relates one or two cases. In 1826 he had a case in St Thomas's Hospital, where there was a slight opacity of the transparent part of one eye, through which ran two large vessels, and with this eye the patient saw yellow; but with the other eye he saw things of their natural colour. In 1827 he had a patient who saw things yellow with both eyes, but he had inflammation of the eyes. In 1831 he had another case. He further mentions that Dr Pemberton saw this occurrence twice; but sufficient has been said, and the explanation seems to me satisfactory—namely, that in the cases where objects appear yellow, there must exist some inflammation of the cornea, or some opacity with enlarged vessels.

Of Constitution.—Fortunately people are in general more disposed to consider their constitutional powers good than otherwise, and this in a degree that would indeed be amusing, if it were not for the gravity of the subject. A patient will say to you, 'Really, doctor, I have never known what it is to have a moment's entire ease these many years: I must have had an excellent constitution originally; and, do you know, it is my firm opinion that I'm sound yet. If I could only get rid of this cough, I should be quite well.' Speeches of this sort are made over and over again by people who have every possible appearance of having the worst constitutions imaginable, and in fact have had every possible evidence themselves of such imperfection of physical power. Some of the most confirmed forms of scrofula show themselves by a succession of slow diseased actions—inflammation of the eyes, enlargements of the glands in the neck, abscesses, diseased hips, and perhaps finally consumption—and these are the people who must have had originally excellent constitutions! The more they have suffered, and do suffer, the more they praise their constitutions; they imagine that the diseases have come, one after the other, like the ghosts in Macbeth—

'Another—and yet a seventh: I'll see no more—and yet the eighth appears.'

It never enters their minds that a poor constitution is the cause of all these visitations, rather than the bulwark against which they are impotently directed.

Of Consumption.—That consumption is catching is a popular opinion, which, in this country at least, is not recognised by the profession. I believe such an opinion, however, to be generally entertained in some parts of the

continent, especially in Spain, Portugal, and Italy. They even burn the clothes of those who have died of the disease, to prevent risk of contagion. It is true that a husband and wife will every now and then die consecutively of this complaint; but this is not more than we should have been led to expect *à priori*; for it not unfrequently must happen that consumptive families will intermarry. I think, indeed, the frequency of these cases of apparent contagion is not greater than what might be supposed likely to occur from mere coincidence in a disease which is so widely diffused. It must be admitted, also, that the anxiety and grief experienced by the survivor in case of the first death will do much to hasten the complaint; and thus the appearance of contagion will be heightened by the rapidity of the succession. Further, there is an idea prevalent that a consumption is cured by an asthma: I conceive this to be altogether erroneous. Asthmatic people are no doubt often considered by the public as consumptive, and it then becomes a matter of surprise that these people continue to live year after year. Sometimes these asthmatic people *do* die in the end consumptive. Supposing, indeed, that a few asthmatic people are found after death to have had tubercles in the lungs, it is scarcely logical to infer that the consumption would have been more rapidly developed if the asthma had not existed. Because those who have asthma in its most marked form do not necessarily become consumptive, is no proof that the asthma prevents consumption. I think the great bulk of consumptive people would be found free from gout; but are we therefore to try to induce gout in order to prevent consumption? My own idea of this opinion about asthma curing consumption, is not only that it is an error, but that it is one calculated to do much mischief. There is also a notion that an ague cures consumption. This is equally ridiculous. There are, in fact, many cases of consumption in the aguish districts. The ague has indeed been often reputed as a curative agent. An attack of the ague may probably have put a stop to some nervous and other complaints. Dr Elliotson states, 'that ague has been thought so capital a thing, that some writers contend it never should be cured; and a proverb once prevailed that

'An ague in spring
Is fit for a king.'

He mentions that Dr Gregory saw a case of palpitation cured by it, and that Dr Fordyce had known many cases cured by it.* However, I should myself be very sorry to try it; and I should be very sceptical of its doing real good in any case.

Proud Flesh.—Patients will frequently come to us to know if there is any proud flesh in their wounds. The fear of proud flesh is very general, and brings many patients to the doctor whom he would otherwise never see. When a wound is attended with loss of substance, it is gradually filled up by the growth of the surrounding parts—a process which is called granulation, from the grain-like surface it presents. The granulations sometimes rise above the level of the surface; and I suppose the term 'proud flesh' was given to this appearance as a figurative term for a luxuriant or forward growth. There is nothing really bad or malignant, as it is called, in the elevation, but it is rather indicative of a complete and rapid repair. There are, it is true, complaints which are attended with what are named malignant fungous growths; but they are happily very rare, and quite unconnected with the healing of common sores. I shall not dwell, however, upon the latter, as it would carry me on to the description of a disease which is out of my present province, and would only be tedious or unintelligible to unprofessional persons. It is perhaps, after all, almost a pity to disabuse the public mind of the idea of proud flesh; for it is friendly to the doctors, and may tend to induce the people to have their sores better looked after.

* Watson's Lectures on the Principles and Practice of Medicine, vol. ii. p. 522.

* Elliotson's Lectures on the Practice of Physic, p. 274.

Broke a Blood-vessel.—The phrase 'broke a blood-vessel' is very common; and I imagine that it is commonly supposed, in the case of spitting of blood, that a large blood-vessel has given way in the lungs. Blood-vessels do sometimes become diseased, and give way; but in the great number of instances in which spitting of blood arises, the blood is exuded from the surface, as it is in bleeding of the nose. On inspection after death of the greater part of the bodies of those who have lost large quantities of blood by spitting, no trace has been discovered of any ruptured vessel, so that the term is not to be considered literal in its application to the ordinary cases of spitting of blood. In apoplexy, however, it is often found that a blood-vessel has actually given way in the brain, and the clot is discovered after death; so that if we spoke of this latter complaint as the breaking of a blood-vessel, we should be more likely to be correct.

THE HARVEST IN BRITTANY.

OFTEN had I watched the ingathering of the harvest, and shared in the joyous festivity of those by whose labours it was treasured up in our garners; but having heard some curious details concerning the peculiarities observable in Brittany on those occasions, I longed to find myself among the primitive people of that province during the season of their harvest labours. I had been told of the veneration with which the Bretons—still imbued with the spirit of Druidical polytheism—watched the great mystery of vegetable reproduction, and of the devotion with which they gathered in the ripe and yellow corn, seeming almost to adore under this material form a benevolent Deity. I was very glad, therefore, to have an opportunity of witnessing these singular traces of Paganism, veiled as they are, but not destroyed, by Christianity. Our whole party shared in these feelings of curiosity and interest. Accordingly, we resolved to rise at the dawn of day, that we might be present at the earliest labours of the harvest.

About forty peasants were assembled in the thrashing-floor. They were clad in coarse shirts and linen trousers, their feet bare, and their heads only partially covered by the Greek cap, worn carelessly on one side. Each of them bore a sickle beneath his arm. They were full of life and movement, looking earnestly towards the plain, as if longing to begin their appointed work.

On a given signal, they advanced towards that portion of the tilled land which was to be the first reaped, and placed themselves in a line at some distance from each other, so as to cover a good deal of ground. There was a moment's pause; and while passing their scythes lightly over the black stone which was to lend them a finer edge, the labourers looked thoughtfully on the wide extent of corn-land lying before them. I approached an aged peasant, who was so absorbed in the contemplation, that he had allowed his pipe to extinguish itself between his teeth.

'Well, my friend,' said I, 'here is a glorious harvest.'

'Yes, sir: God is very bountiful!' was his reply; adding immediately, 'there is gold in those ears, sir!'

'Yet I am told that there was no manure, and very little labour, expended on this tract of land; that the seed was merely thrown into the earth.'

The old man smiled. 'It is, sir, that the earth here is still young; so she gives without reckoning. When she grows older, she will become more prudent!'

At this moment the proprietor gave orders to the head reaper to begin. This leader was a young man of middle stature, but of remarkable strength and beauty. There was an elastic vigour in his movements, and a power of muscle, which belong to the perfection of healthful manhood. It was owing to his strength and skill that he enjoyed the distinction of leading this band of labourers; not that the title of chief had been expressly conferred on him, neither had he claimed it for himself; but it fell to his lot through that tacit con-

viction of superiority which accompanies a remarkable capacity of any kind.

No sooner had the expected signal been made, than he raised his sickle with a joyous cry, and was about to give the first stroke, when a sudden thought seemed to arrest his hand, and turning round towards the old man, with whom I had been speaking, he approached him with an uncovered head.

'Take the lead of the reapers, my father,' said he, in a respectful tone: 'it is not fitting that young men should be in the foremost rank, and the elder ones behind.'

A gleam of joy lighted up the sunburnt features of the old peasant as he silently took the place which his son had just relinquished, while the latter fell to the rear. Immediately the work began, and continued, with little intermission, until the approach of evening, when they began to carry the sheaves of corn to the thrashing-floor. When the sun was setting, we watched the first cart laden with corn, as it drew nigh to the farmhouse. It advanced across the sand, accompanied by the music of countless bells, which tingled on the horses' heads, and by the joyous songs of the reapers who were following it. A long tri-coloured flag floated over the corn, and from beneath its folds were peeping two little laughing urchins, who were half buried amid the heaps of corn, while they *made-believe* to be guiding the horses, whose reins lay carelessly in their hands. We stopped a moment to consider this beautiful picture, so rich in contrasts and in poetic thought; for the most prosaic mind could not help being interested by the sight of this rich harvest store advancing across a region which had recently been won from the ocean; guided only by children, and escorted by the peasants of the soil.

The following day was spent in beating out the corn. The old man who had accepted from his son the leadership of the peasants kept his post. When the sheaves were laid upon the floor, he placed his foot upon the outspread corn, and made thereon with his sickle the sign of the cross, muttering the while a few words of prayer. No sooner had this brief religious ceremony been concluded, than the other labourers placed themselves around the floor. At first, their flails were raised slowly, and without order, and they balanced themselves, as if preparing for some powerful effort; but suddenly, on hearing the signal cry from their leader, every flail was raised at the same moment, and fell to the earth simultaneously—this movement being continued with a measured cadence. The *batterie*, at first light and moderate, grew more and more animated, until at length it became vehement and passionate. The reapers, carried away by a sort of nervous inebriety, sprang upon the bounding straw, whereon their blows fell with the fury of a summer hail-storm. The dust flew about them in whirling clouds, and their brows were laden with moisture. Now and then weariness would overtake them, and the noise would become more hushed, as if coming from a distance. Then their aged leader would utter a peculiar cry of encouragement or of reproach, and thirty voices would echo it, and every flail would be raised with tenfold vigour, and the noise of the *batterie* would sound like an approaching thunder-storm, waxing each moment louder and deeper.

I remained in the granary all day, watching the animated picture which presented itself, and observing, with a sort of dreaming curiosity, all the scenes of this country drama. The ensuing morning, the sun, which had hitherto shone out with continued brilliancy, veiled itself with clouds, and a soft drizzling rain impeded the harvest work. The peasants began to cover in the thrashing-floor, and to gather the beaten corn into the barn. Unfortunately, these operations went on slowly in comparison with the amount of work to be done. The rain fell heavier, and fears were entertained lest part of the wheat, which was still unhoused, might be seriously injured. The proprietor was lamenting the impossibility of procuring as many hands as were needed to gather in the grain more rapidly, when an old

man, followed by five young ones, all armed with forks and rakes, entered the barn. He advanced towards the astonished farmer, and uncovering his white hairs—'I have heard,' said he, 'that you were gathering in your harvest, and seeing this rain come on so heavily, I thought that a dozen more arms might be of service to you, so I am come with my lads.'

'May God bless you, good father!' said the proprietor, offering his hand to the venerable peasant; 'but I did not expect this aid from you. Have you, then, forgotten our lawsuit, and the fine inflicted on you through my means?'

The old man shrugged his shoulders, saying, 'Our Saviour was more outraged than ever I was, and he forgave his murderers. Besides, the quarrels of neighbours should not be allowed to diminish the poor man's bread. He who lets God's wheat be destroyed, cannot be a good Christian. Now we are going to carry home your corn; and when the sun shines out again, your thrashers will make room for us, and we will help them to make up for lost time.'

Without waiting to receive the thanks which were being lavished on him by the farmer, the old man and his sons hastened to join the reapers, with whom they laboured until evening. The next morning they returned to their work; and when the harvest had all been safely gathered in, they withdrew to their home without accepting any reward, and seeming utterly unconscious that they had done aught which deserved the smallest praise or approval.

ENEMIES.

Have you enemies? Go straight on, and mind them not. If they block up your path, walk around them, and do your duty regardless of their spite. A man who has no enemies is seldom good for anything: he is made of that kind of material which is so easily worked, that every one has a hand in it. A sterling character—one who thinks for himself, and speaks what he thinks—is always sure to have enemies. They are as necessary to him as fresh air: they keep him alive and active. A celebrated character, who was surrounded with enemies, used to remark—'They are sparks which, if you do not blow, will go out of themselves.' Let this be your feeling while endeavouring to live down the scandal of those who are bitter against you. If you stop to dispute, you do but as they desire, and open the way for more abuse. Let the poor fellows talk; there will be a reaction if you perform but your duty, and hundreds who were once alienated from you will flock to you and acknowledge their error.—*Alexander's Messenger.*

ANECDOTE OF A NEWFOUNDLAND DOG.

A gentleman connected with the Newfoundland fishery was once possessed of a dog of singular fidelity and sagacity. On one occasion a boat and a crew in his employ were in circumstances of considerable peril, just outside a line of breakers, which—owing to some change in wind or weather—had, since the departure of the boat, rendered the return-passage through them most hazardous. The spectators on shore were quite unable to render any assistance to their friends afloat. Much time had been spent, and the danger seemed to increase rather than diminish. Our friend, the dog, looked on for a length of time, evidently aware of there being great cause for anxiety in those around. Presently, however, he took to the water, and made his way through to the boat. The crew supposed he wished to join them, and made various attempts to induce him to come aboard; but no! he would not go within their reach, but continued swimming about a short distance from them. After a while, and several comments on the peculiar conduct of the dog, one of the hands suddenly divined his apparent meaning: 'Give him the end of a rope,' he said; 'that is what he wants.' The rope was thrown—the dog seized the end in an instant, turned round, and made straight for the shore; where a few minutes afterwards boat and crew—thanks to the intelligence of their four-footed friend—were placed safe and undamaged. Was there no reasoning here? No acting with a view to an end or for a given motive? Or was it nothing but ordinary instinct?—*Rev. J. C. Atkinson in 'The Zoologist.'*

MR BURTON'S WORK ON POLITICAL AND SOCIAL ECONOMY.

DURING the last twelve months a desire has been repeatedly expressed to us for a short popular work treating of the more important questions in political and social economy. These requests were suggested by the convulsed state of Europe. The wildest theories, striking at the root of law, order, and individual rights, were to all appearance about to dissolve society into its rude elements. One of the greatest literary men of the age had found it necessary to write a treatise to prove that 'property is not theft.' While such strange and disorderly sentiments were afloat, it is not surprising that many persons should have desired to see a popular work explanatory of the true and imperishable principles on which society is founded, and by which it carries on its complex operations.

In the hope of meeting this wish, Mr J. H. Burton has, at our request, undertaken a small work, which is now published as part of the series of works now issuing under the title of 'CHAMBERS'S INSTRUCTIVE AND ENTERTAINING LIBRARY.'

Referring to the manner in which he has treated his subject, the author observes that 'It is a common complaint against political economy, in the form in which it is usually embodied, that though dealing with man, his passions and wants, and with the elements of his happiness and his misery, it is as hard and cold as if it gave expression to the laws of inanimate nature. From every truth in political economy, the acting and thinking man should be able to derive a rule of life, with reference to evils that may be practically avoided, and good that may be rationally anticipated; but he complains that even in matters like surplus population, commercial revulsions, gluts, and panics, and labour and its rewards, in which his temporal prospects, and those of the whole race, are so deeply involved, he finds only cold formulas or abstract laws, derived from what men usually do, not indicating what they might accomplish; and thus he fails to acquire from these abstractions the light and assistance which he seeks, to cheer, encourage, and fortify him in his path through life. It may be mainly attributed to the want of living systems founded on the true principles of political economy, that of late, projects founded on a contradiction of the whole science, and resting on the most dangerous and disorganising fallacies, have been so extensively adopted as to lead to the direst calamities. The false opinions presented themselves in that living, breathing form which the true science would not condescend to adopt; and the multitude, demanding a guide that pointed to practical conduct, instead of merely developing rigid formulas, followed the first that offered itself.'

Avoiding defects of this nature, the author has adapted his doctrines to the popular understanding, and brought them into relation with the ordinary course of events.

With these explanations, we respectfully dedicate 'Political and Social Economy' to the use of all classes of The People.

LISTENING TO EVIL REPORTS.

The longer I live, the more I feel the importance of adhering to the rule which I have laid down for myself in relation to such matters:—1. To hear as little as possible whatever is to the prejudice of others. 2. To believe nothing of the kind till I am absolutely forced to it. 3. Never to drink into the spirit of one who circulates an evil report. 4. Always to moderate, as far as I can, the unkindness which is expressed towards others. 5. Always to believe that, if the other side were heard, a very different account would be given of the matter.—*Carus's Life of Simeon.*

THE SLAVE MARKETS OF EGYPT.

THERE is no longer, properly speaking, any 'Slave-Bazaar' in Egypt: the building described by travellers under that name is now devoted to other purposes; but the traffic in slaves is pursued with undiminished vigour. A native family, whether Mohammedan or Christian, scarcely considers itself complete without a purchased attendant, male or female; and there is consequently a regular demand, principally, it is true, for blacks—whites being an expensive luxury, in which only a few can indulge. I do not at present intend to enter upon the question of the treatment of slaves in the East; but I will observe, in passing, that there appears to me to be too great a disposition in some writers to palliate the institution of slavery, by expatiating on the kindness and benignity of Turkish masters. It is true that in many cases the slaves are incorporated in the family, and, though now and then beaten, are often well fed and well clothed. But if we insist too much on these facts, we shall produce an erroneous impression. Frequently the position of the slaves, male and female, is one of unspeakable degradation and misery. It is needless to enter into details that would shock and disgust; but I may mention by the way that I have seen a respectable-looking old man in a public bazaar bite the ear of a newly-purchased boy until the blood came, for some slight cause of displeasure. The only suicides, moreover, I ever heard of in Egypt were those of slaves; and a striking instance occurred last spring, when a young Menlook, belonging to Saïd Pacha, son of the viceroy, shot himself to avoid the barbarous punishment he apprehended would follow a very trifling transgression.

It is, however, with slaves as an article of traffic that we have at present to do. The blacks are principally brought down the valley of the Nile, from Abyssinia, Sennaar, Kordofan, Darfûr, &c. The commoner sort are derived indiscriminately from the numerous male tribes that inhabit the confines of those regions; but the most esteemed are the Gallas, who inhabit the southern borders of Abyssinia. It is not true that the majority of them are prisoners made in the intestine struggles of these people; for the commerce in slaves is too lucrative to be allowed to depend on such casual sources. Regular man-hunts are periodically set on foot by the princes and chieftains of these regions; and Mohammed Ali himself, in spite of his repeated promises to the contrary, used, until very late years, to despatch expeditions to Kordofan from time to time in order to make a *battue*—the product of which was distributed to the officers and men in lieu of pay. His conquests, therefore, in that direction were made to cover their own expenses; and he derived another advantage in the shape of revenue, by the tax of about

two pounds sterling per head levied on all slaves imported into Egypt across its southern frontier.

The horrors of the march of the slave caravans have frequently been described. Even considerations of self-interest seem to have little effect in softening the native brutality of the *jellabis*, as the dealers are called. The wretched victims are driven along generally on foot; their numbers decreasing on the way by hunger, thirst, fatigue, and ill-treatment, and the value of the remainder proportionately increasing. A certain number are left at Syout and Girgeh, and the remainder are hurried on to Cairo. The latter portion of the journey is in some instances performed by water; and you may constantly see whole gangs of wild-looking half-naked savages landed at Boulac from the grain-boats, in which they have been shipped as part of the cargo, and sometimes also cabinfuls of the more valuable female slaves.

In all times, the greater part of the trade has been conducted in a private way, although, as I have intimated, there was at one period a large *wakâlah* especially devoted to the sale of slaves. Now-a-days, especially since the *hatti sherif* of Sultan Abd-el-Mejid, abolishing the public traffic in human beings, the *jellabis* take their property to a variety of depôts, generally situated in the little suburbs that have collected outside the walls, especially near the Bab-en-Nair. I have often seen thirty or forty boys and girls in the courtyards of these buildings, but the better class of females are generally exhibited by twos and threes.

Strangers who wish to visit the depôts generally provide themselves with a supply of small coins to distribute in presents. As soon as you pass the gates, you are sure to see a number of idle *jellabis* hanging about: they understand at once what is your object, and you have no farther necessity for a guide. The *jellabis* are, I believe, generally Nubians, and seemed to me to be all of one family. Their countenances are invariably truculent, and their insolence is proverbial. They wear white turbans, twisted in a peculiar way, and raised up to an enormous height. I went one day with some English friends to see a small batch of superior Galla girls. A very narrow lane, formed by half-ruined dead-walls, led to a large sinister-looking building, round the doorway of which a number of *jellabis* were squatting. After some parley, we were allowed to go up stairs, preceded, as well as followed, by a noisy crowd, who stopped almost at every step to thrust out their hands and ask for a present. On the second floor there was a long narrow passage, on each side of which were dark rooms, in which we could just dimly discover groups of human figures huddled together in corners. As we passed, they raised their heads and looked at us with curiosity, rolling about their white eyeballs in a curious fashion. Many attempted to come

out to us, and several thin hands were thrust forth through barred windows for a *bucksheesh* (present). At length we reached a large apartment, divided into two by a screen of mats. We were here told to wait a minute by the chief jellabi, who went inside, whilst the rest continued their vociferations for money. After some delay, two wretched-looking girls, with scarcely a rag of clothing, came out, and stood shivering before us. This was the usual piece of imposition. The object was to make us at once give the present we had originally intended, and then to produce the better class of slaves, and claim a larger amount. After some altercation, however, the jellabi again retired, and presently the matting was pushed aside, and out came three elegantly-formed young women—black, it is true, as jet, but evidently of a superior race. These were the Gallas. Their features were regular and pleasing, the expressions soft and melancholy. Their hair, as is indeed universally the case with negro slaves exposed for sale, was arranged in an immense mass of curls, about the thickness of a tobacco pipe, lying close together. One had a necklace of brass wire; the others wore beads. Their dress was so scanty, that we had ample opportunity of witnessing the perfection of their forms. The poor creatures seemed anxious to be bought; and we could detect an expression of disappointment when they understood that we had only come actuated by a motive of curiosity. They murmured something in their own tongue, and were evidently very glad that we did not long abuse the advantage of our position, but allowed them soon to retire behind their mat with their present; which no doubt was snatched from them by their masters as soon as our backs were turned.

It is much easier to get into one of these places than to get out. The jellabis make a practice of endeavouring to intimidate their visitors into giving them more bucksheesh. Whether you be liberal or otherwise, you are always compelled to leave them dissatisfied. On the present occasion they closed the doors of the house, and surrounded us with loud vociferations. A dozen hands were thrust towards us, over shoulders, under arms, in the narrow dark passage—most of them significantly opened, but one holding a knife, and others heavy Nubian clubs of carved wood. We knew, however, what these demonstrations were worth; and after a slight scuffle, succeeded in extricating ourselves from this den of iniquity, and rode off, pursued for some distance along the streets by the clamorous rabble, who vowed and protested we had given them nothing, and denounced us to the bystanders as dogs and infidels. The foremost of them, however, used always to claim acquaintance with me afterwards, on the score, perhaps, of a blow with a *koorbash* (whip of hippopotamus hide) which I dealt upon his shoulders. On another occasion he took me and a French gentleman, who, like all newcomers, was curious about these sights, to a different place, where we saw a larger number of slaves at a much smaller expense. He had grown wiser by experience, and was but moderately importunate.

The treatment of slaves in the wakálahs is necessarily a great deal better than that which they experience during the journey down from the upper country. It very much resembles, however, that of pigs and poultry in a farmyard. The generality of the slave wakálahs are small: in some cases the centre courtyard is not more than twenty feet square, and there is no upper storey. Little cells without doors may be seen on all sides, each appropriated to five or six slaves, males and females often indiscriminately mixed. At

noon and sunset, a large wooden bowl of beans or lentils is placed in the centre of the yard, and the greater number of the hungry inmates crowd round this, pushing and shoving in order to get into the first rank; some making good their station, and others carrying off a handful to devour in a corner. The whole disappears in a few seconds. Some of the more valuable females are fed apart in the cells. I remember seeing a magnificent Abyssinian woman eating alone from a bowl of rice in a sombre room, with the doorway half closed by a mat. She stopped when we looked in, and turned her olive face and fiery eyes towards us. We offered her the few piastres which remained to us after the furious begging of the other poor creatures; but she would not trouble herself to take them. 'Put them down by her side,' said the huge ruffian of a jellabi who owned her. We did so: she remained immovable, glaring at us like a tigress; but he swept them with a chuckle into his hand, saying he would take care of them for her. This was an instance of a not uncommon character among slaves. She was revenging herself for the ill-treatment inflicted on her by frightening every purchaser that presented himself. I saw her some months afterwards, when her spirit was broken, and she wished to be sold; but no buyer was to be found.

It is not customary for Egyptians in want of slaves to visit the wakálahs. Sometimes a few are taken to the bazaars, where they are put up to auction; but generally a servant is sent to a jellabi, with orders for him to bring a proper assortment to the house. Slaves just brought down from the upper country are preferred to such as have been in a family previously, as the latter are supposed not only to have been sold for some fault, but to have learned cunning tricks and bad habits, which every one hopes to guard against in those whose education has not begun. The jellabis, however, know this, and almost invariably dress up all the slaves committed to their care as if they had just been caught and brought down; that is to say, they curl their hair in the manner above described, and give them a single rag to fasten round their middles. Thus accoutred, the poor things are driven along the streets in troops to the house of the intended purchaser.

I called one morning on a Levantin lady of my acquaintance in Alexandria, and found her in conversation with a tall, handsome, black girl, wrapped in a white *melayah*, or mantle. The lady reclined in the corner of her divan, smoking a *shishseh*, or water pipe, whilst the girl stood at a little distance, with her hands meekly crossed. After the usual compliments, I was told that this was a slave belonging to a Turkish lady just arrived with her suite from Algiers, to meet her husband, who, however, had gone on to Stamboul, leaving word that she was to follow. As he had not left money enough to defray the expenses of the journey, it seemed quite natural to the lady to dispose of one of her bought handmaidens, and accordingly this one had been selected. Fatmeh herself was telling the story as I entered; and although it did not seem to occur to her that she was the victim of a most unjust system, yet she could not help expressing her regret at being thus suddenly thrown out of the bosom of one family to seek for a place in another, or rather to take the place which chance might assign her. I elicited the fact, that although her mistress sometimes beat her, even for talking in her sleep, and for being frightened on board the vessel in which they had coasted the whole north of Africa, although she was frightened herself—yet, considering all things, she had been happy with her. Here, then, was an instance in which the much vaunted kindness with which the Orientals treat their slaves was turned into a weapon of torture to them. The stronger they are bound by ties of affection to their owners, the more cruelly are their feelings wounded when the vicissitudes of their servile life throw them into the market.

Struck by this circumstance, I afterwards made inquiries, and found that the instances in which slaves remain attached to one family throughout their existence are comparatively few. If misfortune overtakes a man, of course the slaves are sold; they go as part of the property in the case of a failure, for example; and how many Egyptian merchants have not failed once, twice, thrice! A man who has compounded with his creditors only once is esteemed a remarkably safe person to deal with; although, in almost every instance, there is a dishonest concealment of property. But this is by the by: on the first pressure of pecuniary difficulties, one at least of the slaves of the house is got rid of. 'I have so much in my shop,' you may often hear it said; 'I have built so and so; and I have the donkey and Zara' (a common name to give to slaves).

Fatmeb tried hard, poor thing, to persuade my friend to buy her: she walked about to show that she was active; arranged the cushions of the divan, and trimmed the shishah, to exhibit her familiarity with a genteel house; and laughed with forced gaiety to prove that she was of a good temper. There was a ground of objection, however, which Sitt Miriam, as my friend was called, suspected, and the truth of which she endeavoured to ascertain by a series of sudden questions and artful cross-examinations.

The chief difficulty, however, remained. Would a couple of days of trial be allowed? 'Unless they are,' said Miriam to Fatmeb, 'I shall not buy you. How do I know what bad habits you may have? You have acknowledged you talk in your sleep. I don't care for that, as you would be shut up at night; but you may be a liar, you may be a thief, you may'— And here followed a list of vices incident to female slaves, during the utterance of which I scarcely knew whether to look at the ceiling or the floor, but which poor Fatmeb listened to most patiently, firmly denying that she possessed such habits and imperfections. One of her observations was sensible enough; for she said that a trial of two days would be of no avail, since any person in her position would be able to put on a fair outside for so short a time. Altogether, it was observable that she had been brought up in a good family, and knew something of the world; and it was easy to see that Sitt Miriam rather feared she was far too clever and knowing. I had no doubt of her being something of a politician; for she endeavoured throughout to appear in the character of an innocent simple girl, whereas she was, in the Eastern style, a refined and well-educated woman. However, such was her fascination, that my friend would certainly have bought her, but that her mistress sent an old duenna with a message from the wakalah where she was living, to the effect that an offer had been made, and that, unless the money was immediately forthcoming, Fatmeb must return to her. The girl accordingly departed, not without expressions of sorrow; but she had scarcely been gone half an hour, when Sitt Miriam, who had sat reflective during that time, clapped her hands, and calling her servant, ordered him to go instantly and say that she would pay the price. It was too late: Fatmeb had already passed into the harem of an old Turk, who made up his mind at once on seeing her.

'God is merciful!' said my friend, consoling herself. 'Perhaps that girl had some grievous fault, and I may be well delivered.' Her evanescent affection for Fatmeb was here wafted away on a long sigh, and she added, smiling, 'I shall send to-morrow morning for half-a-dozen girls from the jellabis. If you like to come and see me buy them you may.'

I confess that, in spite of the reflection that I was giving a sanction to a very bad system by my presence, I made an appointment for the next day, and punctually kept it. I found the Lady Miriam alone; and whilst waiting the return of the servant, who had gone to the nearest wakalah for a jellabi, had to listen to a history of all the slaves the good lady had ever possessed, interlarded with a good many scandalous stories I cannot

repeat. The domestic history of Christian families in the East is a curious one. The plague of polygamy has practically penetrated them all. I never knew a couple who had not periodical outbreaks on this subject. The Christian women will not tamely put up with the insult; and no occurrence is more common than that of wives leaving their husbands on this account, and taking refuge with their relations. It is curious to remark, by the way, that in spite of the great number of intermarriages among different coloured races, there are no mulattoes in Egypt. The climate is so deadly to foreigners at the second degree, that the children, except in rare instances, do not live. This is one of the strongest proofs of the descent of the present fellahs from the ancient Egyptians. Foreign families never survive beyond the third generation; and every mixed race has a feeble and uncertain existence.

I suggested these considerations to my fair friend, who kindly told me I was a fool for troubling my head on such subjects; but confirmed my observation that very few half-castes ever reached man's estate. While we were talking, we heard the hoarse voice of a jellabi in the court; and presently up came a dark bevy of half-clothed damsels for inspection, the owner sitting down on a bench in the courtyard below quietly smoking, ready to answer any questions. A rapid glance of Sitt Miriam's practised eye sufficed to detect those between whom she was likely to hesitate, and the others were at once sent away. I asked her the grounds on which she decided.

'All those I have dismissed,' said she, 'have been in families before: I knew it at once by their way of standing, in spite of their being dressed like wild beasts. They have been sold by their masters in Cairo, and shipped to Alexandria. All the bad slaves and lame donkeys are sent down here. I know the tricks of these slave-dealers: may misfortune come to them!'

She went on in this style for some time; and then suddenly turning to the younger of the two girls, who stood huddled together in a corner, ordered her, in an insulting manner, to come forward, at the same time abusing her race. It is impossible to describe the expression of rage and hatred which shot, like a lightning flash, athwart the face of the girl, who thus, in an unguarded moment, betrayed that she still possessed all the wild untamed feelings of her native woods. I looked at once with interest upon her; for that glance revealed that not all the ill-treatment and suffering to which she had been subjected during a journey of thousands of miles, over deserts which we should consider it a mighty triumph to traverse, had broken her spirit, and rendered her insensible to injury. To my mind, such a character would recommend itself. The readiest to resent ill-usage are often the most susceptible of kindly impressions. But this young savage was at once judged by my prudent friend, who dismissed her to join her companions below, and applauded her own keen appreciation of character on beholding the look of scorn and defiance, that would have become a princess, with which she walked away.

'Now come you here,' said Sitt Miriam to the remaining girl, who with a stupified yet anxious gaze had watched the scene I have described. She approached, or rather crept forward, keeping her eyes on those of the Sitt, who was a good soul at bottom, and expressed to me, in broken Italian, her sorrow at being obliged to put on an appearance of harshness. I know she was an excellent mistress, and certainly never beat her slaves.

I need not repeat the conversation that ensued; suffice it to say, that it was satisfactory. The girl was very ignorant, and apparently good-natured. But my fair friend would not trust to appearances; she had a whole host of little expedients for diving into the recesses of the human heart.

'Give me your hand, Zara,' choosing one of the half-dozen names commonly bestowed on slaves.

The girl obeyed. Sitt Miriam took the thin hand held out to her, looked rather awkwardly at me for a

moment, and then spat in it! I started, and uttered an exclamation.

'*Stato tranquillo!*' quoth she to me aside in her *lingua Franca*. 'Be quiet; it is the custom. What do you call that in your country, Zara?'

The girl looked perplexed; but if she was offended, she kept down her resentment in the very lowest recesses of her heart. Her reply was in a tone of angelic meekness: 'I know the name of it in Arabic, oh, lady!'

Sitt Miriam blushed scarlet: the rebuke told. She let fall the slave's hand, and said, 'You are a good girl, and very learned. I shall pay your price. Don't look angry; oh Frank,' she added, turning to me with some confusion; 'you know I mean to be kind to her. Anybody else would have struck her on the mouth with a slipper, but I am not so cruel. Let us now go and speak to the jellabi.'

A fierce volley of words was exchanged for some time between the slave-dealer and Lady Miriam; he beginning by asking about eighteen pounds, and she offering eight. It was exactly like a bargain for a yard of cloth. 'I will give so much.' '*Jesta Allah!* God will open'—that is, another door for sale, was the customary evasive reply. This went on for half an hour, during which my fair friend stood screaming from the gallery, whilst the jellabi sat quietly below smoking, giving occasionally an answer in the words I have mentioned, and sometimes, when vexed by a ridiculously low offer pertinaciously repeated, putting in that he would give the girl as a present. At length they gradually approached one another in price, the altercation becoming hotter and hotter, however, as they did so; until at length, when the difference was only a few piastres, the bargain was several times broken off, and Zara ordered to go. This, in fact, was the serious part of the discussion, the previous exorbitant demand and consequent low offer being mere skirmishing. Terms were, however, at last come to; and the price of 1350 piastres (not quite L.14) was agreed upon, to be paid in two or three days, in case the girl discovered no hidden bad qualities. Ordinary black slaves, male and female, generally fetch from ten to twenty pounds; but thirty, and even forty or fifty, are paid for fine Abyssinian women.

I ought to add that it is important to ascertain, if possible, the temper of household slaves before buying them. They are sometimes very troublesome; and have been known to murder their masters and mistresses. I once saw a horrid sight—a black woman paraded on an ass about the streets of Alexandria with her face turned to the tail: a man went before proclaiming that she was a poisoner. For several hours the wretched creature was paraded in this manner, after which the executioners put her into a sack, and taking her out in a boat some distance to sea, threw her overboard.

THE CAPTAIN'S STORY—A PENINSULAR ADVENTURE.

In the neighbourhood of the Haymarket, London, there are several minor chess, whist, and gossip clubs, held principally at cafés, in an apartment which, for club evenings, is sacred to the members, consisting chiefly of superannuated clerks, actors, and other professional mediocrities, with a sprinkling of substantial, steady tradesmen. In one of these modest gatherings Captain Smith, an extremely communicative and anecdotal gentleman, may occasionally be met with, surrounded by an attentive circle of admiring friends, listening, with all their ears, to one of the many marvellous adventures it has been his lot to encounter during a wandering and varied life. He is not a frequent visitor; his tastes inclining him to scenes of more boisterous conviviality than cigars and coffee, with a seasoning of theatrical and political gossip, can afford or supply; and he accordingly uses these, to him hum-drum assemblies, only as resting or halting-places between more exciting orgies; valuable chiefly for affording him listeners, much more easily amused and astonished than men of larger life-adventure

and experience. He is, however, a *real* captain, and I fancy something of a hero too, in the conventional use of the term, as he seems to have very different, and, I believe, much truer notions of war and glory, than gentlemen who shout about 'bright swords,' and dilate with periphrastic unction of 'red battle-fields.' A lithe active man is he; and stiff as a ramrod withal. His harsh stubbly hair is brushed in one particular direction with parade precision; and his high bald forehead, when in convivial mood, glistens as brightly as his sharp gray eyes; which one can see with half a one, have been wide open all his life. He rose, it is understood, though he never mentions it himself—perhaps from a feeling of modesty, a quality, albeit, in which, like most field heroes, he is somewhat deficient—from the ranks. From his perfect knowledge of the Spanish tongue (he passed his youth at Gibraltar, with occasional trips to the Spanish coast with his father, who turned an honest penny in the smuggling line), he was frequently employed during the Peninsular war by the British commanders in the very necessary, but extremely ticklish, duty of making himself *personally* acquainted with the state of the French camps and fortresses—in other words, as a *spy*: an exceedingly uncomfortable office for any gentleman troubled with 'nerves.' Captain Smith frequently thanks God he never had any, to his knowledge, in his life: no more, he sometimes says, after reading the debates—no more than a member of parliament.

Thus much premised, suppose we step in for a minute, and make his acquaintance. That is the captain with his back to the fire. The gentleman who has just handed him a cigar, and is addressing such martial queries to the old campaigner, is a neighbouring haberdasher. Just before we entered, he inquired, as is his nightly wont, if the waiter was sure the clock was quite right. He is always a little nervous about the time, as his spouse is apt to be unpleasantly lively for a lady of her colloquial and other prowess, if he is not at home at half-past ten precisely. He loves peace 'at home,' as much as he seems to delight in war 'abroad,' and is consequently extremely punctual. But see, Tape is tapping the captain again. The veteran cannot fail to flow forth presently: at first, perhaps, a little jerkily—*glug, glug, glug*—but after a little coaxing, in the freest, easiest style imaginable.

'A splendid march, Captain Smith, that of Wellington upon Ciudad Rodrigo?'

'Sloppy, Mr Tape, sloppy: nothing but mud, and snow, and slush. Winter-time: I remember it well,' replied Captain Smith.

'Beautiful account Napier gives of it,' rejoined the martial Tape. 'Wellington,' he says, 'jumped on the devoted fortress with both his feet!'

'Does Napier say that?' demanded the veteran, knocking the consumed ashes off the end of his cigar on the mantelpiece. 'Does Napier say that?'

'Yes indeed he does.'

'Then Napier tells what is —,' replied the matter-of-fact captain. 'The lightest, longest-legged of the "Light Bobs" couldn't have done it, much less the duke. The duke's short in the legs—sits high in the saddle, though—long body, dumpy legs. Could no more do it than he could fly: didn't try either. All a flam!'

Mr Tape explained that the jumping was metaphorical; and after a time, Captain Smith seemed to have acquired a misty notion of what was meant. Still, it was, he said, a very bad way of writing 'history,' which species of composition should, he emphatically observed, be all facts, and no mistakes.

'The retreat from Burgos was a masterly affair,' persisted warrior Tape: 'masterly indeed—uncommon!'

'I daresay it was; and as you seem to admire it so much, I wish you had been one of the 'prentices under the master, just to see how it was done, and how agreeable and pleasant such a masterly job is to the people that do the work. I was one of them; and I declare to you I had much rather have been in this café, smoking this abominable cigar, which *wont* smoke'—and the captain threw the unsatisfactory weed into the fire; immediately,

however, accepting another from the ready hand of the obsequious Tape. That, fortunately, drew uncommonly well: the spiral columns ascended with the fullness and freedom in which the veteran loved to luxuriate. He swallowed his *demi-tasse* at a gulp; and his sharp gray eyes, twinkling with fresh lustre, said—'It was in coming from Burgos that I got into one of the miserablest scrapes I ever experienced in my life; and all owing to my tender-heartedness, the very worst thing for a campaign a man can carry about him.'

'Tell us, captain! What was it? How was it?' cried half-a-dozen voices. Two elderly gentlemen, who had been playing draughts for the previous four or five hours, finding it impossible, amidst so much clamour, to bestow the requisite attention on their extremely intellectual game, also drew near to listen, as the very best thing, after draughts, they could do.

Captain Smith smiled graciously, seated himself, indulged in a few prefatory whiffs, and proceeded. 'During the many journeys I at different times made through the province of Leon in Spain, I fell in with a very worthy couple, whom I took a great liking to. Pedro Davila was by trade a cooper: he made all the casks and tubs for miles round the little town near which he lived; which was situated, I should tell you, a good deal out of the direct road, or rather the nearest road—for there is nothing very direct in that country—from Burgos to Astorga. For my part I preferred round-about ways at that time to straight ones; I found them safer. Pedro had a nice garden too, beautifully cultivated, and the prettiest little black-eyed Andalusian wife—Pedro was also a native of the south of Spain—a man's eyes ever lighted upon. Pedro in his youth had taken service with a Spanish grandee, who, being compelled to fly his country—a common, every-day thing abroad—took up his abode in Paris; and there Pedro got rid of his fine old constitutional prejudices against foreigners, and obtained in exchange some modern universal philanthropy—about the most dangerous article to go to market with in Spain it is possible to imagine. And sure I am that if Pedro had known what a dreadful mess his turning philosopher would get me into, to say nothing of his wife, he was far too good a fellow to have done anything of the sort.'

'But what on earth, Captain Smith,' interrupted Tape, 'could philosophy, Pedro's, or any one's else, have to do with you?'

'You will hear, Tape: it was his liberal-mindedness and my tender-heartedness joined together that played the mischief with us both. An excellent fellow, notwithstanding,' continued the captain, after a brief pause, 'was Pedro Davila; too good for a Spaniard, much: one could hardly believe it of him. I was going to say he was equal to an Englishman, but that perhaps would be pushing it too far. Many a skin of wine have we emptied together: none of the sloe stuff you get here, but the genuine juice of the grape itself.' The captain smacked his lips at the pleasing reminiscence, and then, to reward them for the exercise, imbibed a portion of another *demi-tasse*, craftily qualified to his taste.

'At the time I speak of, it was highly dangerous to harbour, succour, or conceal any Frenchman, woman, or child. Death, or worse punishment, was pretty sure to be the doom of any one offending against that law of vengeance; and it happened that one of the most ferocious of minor guerilla leaders, a relentless hunter and slayer of miserable fugitives, was Ramez, a native of the village or town near which Pedro lived. He was seldom long absent from home; and was, in fact, the real governor of the place.'

'Well, it chanced one unfortunate day that a wounded French officer, who had been chased for several days by Ramez and his fellows, crawled into Pedro's cottage, and implored shelter and succour. His request was, as you may anticipate, after what I have told you of Pedro's notions of philosophy, granted; and the hunted man was successfully concealed, carefully tended, and restored to health. The day of his departure had arrived; he was carefully disguised, mounted on Pedro's mule, and was just bidding his benefactor good-by at the garden gate

(Marietta, fortunately, as it turned out, was not at home), when who should poke up his diabolical snout from the other side of the hedge but Ramez! The ugliest rascal, gentlemen,' continued Captain Smith with violent emphasis, 'the most ill-favoured scoundrel I ever saw in my life was Ramez; and that from a man who has been twenty years in the army, and who has lived upwards of twenty in London, is saying a great deal.'

This was quite cheerfully assented to. The ugliness that after such a lengthened and first-rate experience bore off the palm, was pronounced necessarily incomparable by the entire auditory.

'He gave poor Pedro,' continued the captain, 'one most diabolical look (I'll be bound the streaks from his eyes—he always squinted both sides inwards when he was in a passion—crossed each other within an inch of his nose), then rushed forward, and bawled lustily for help. The Frenchman spurred furiously into the adjoining forest, and escaped. Pedro was seized, and the alpha and the omega of it, as the chaplain of the old half-hundredth used to say, was, that he was lugged to prison, tried a few hours afterwards, and condemned to death as a traitor. It was a wild time in Spain then: most places managed their own affairs in their own way, and this was Master Ramez and the *alcalde's* way. Pedro was to have been strangled, *gavotted* they call it, but there was no apparatus handy, and nobody that particularly liked the job; so, as a particular heavenly grace to him, the *alcalde* said, it was determined he should be shot on the third day after his arrest.'

'It happened,' resumed the captain, after again refreshing himself, 'that I was, on the very day after Pedro's arrest and condemnation, returning from Burgos to General Picton's head-quarters, a good way beyond Astorga; and being near, and in no very particular hurry, I turned out of my road to visit Pedro. When I arrived at the cottage, I found things, as you may suppose, in a very different state from what I had been imagining for the last hour or so. Instead of wine, there was hysteries; and for an omelette and salad, shrieks and faintings. Marietta clung round my neck with tremendous energy—I should not have thought, if I had not experienced it, that a pretty woman's embrace could have been so very unpleasant—frantically beseeching me to send for the British army to liberate her Pedro. Extricating myself from her grasp as speedily as possible, I began to cast about in my mind as to what could be done; but I could not at all clear up my ideas. Remembering that I never had been able to do so on a lean stomach, I suggested that we should first dine, and then perhaps I might hit upon something for poor Pedro's benefit. Marietta agreed with me; and we had, considering that her husband and my dearest friend was to be shot the day after the next, a very nice comfortable dinner indeed—very—and some capital wine afterwards; and then, gentlemen, the father of mischief, or the wine, or Marietta's black eyes, I don't know which, perhaps altogether, induced me to make as spoony a proposal as ever fell from the lips of a green Cockney.'

'There are clever, sensible men in the city,' interjected Tape, as the captain paused an instant to supply himself with a fresh cigar.

'Perhaps so, Mr Tape, but those gentlemen seldom volunteer into the army, I believe. I knew,' said the veteran, continuing his narrative, 'that I might as well whistle jigs to a milestone, and expect it to get up and turn partners, as ask the general in command of the division about forty miles off to rescue Pedro from the grasp of the Spanish authorities. The British generals never meddled with the administration of Spanish justice under any pretence whatever; but I also knew that if he received a message stating that I was in danger, he was bound by general orders to afford me every assistance in his power. "Marietta," said I at last—the wine must have been unusually strong—"I have hit upon it. We'll save Pedro yet, in spite of them all!" The pretty creature jumped up, clapped her hands, and sobbing, laughing, and talking all in a breath, exclaimed, "Dear Ingles, I knew you would!" "You, Marietta," said I,

as soon as she was sufficiently calm to listen, "go to Ramez and the alcalde, and tell them you will deliver into their hands the famous Afrancesado spy, Henriquez Bajol, on condition of their releasing Pedro. If they consent, denounce me." "You, Henriquez?" said she, staring bewilderedly. "Never you mind," I replied. "A note to General Picton—I'll write it at once—will soon get me out of their clutches, whoever I am." I wrote the note and gave it her. "Now mind, Marietta," said I solemnly, "that Pedro sets off with this note the instant he is liberated. How soon can he reach the general on foot?" "By to-morrow night," she answered. "Very well; and now then about it at once." She was off in a twinkling, and I was at leisure to reflect on what I had done. To tell the truth, I did not, after a few minutes' quiet cogitation, feel excessively comfortable. They would be certain to believe the story; Henriquez being, I was sure, known to none of them personally. I was a precious deal more like a Spaniard than an Englishman; and I spoke the language so well—not altogether grammatically, it is true, but so like a native of the south of Spain—that I felt I should have some difficulty, should occasion require it, to undeceive them. Then they had such a pestilent way of making not only sure but *short* work with whoever they suspected of commerce with the hated French, that it flashed unpleasantly across my mind—the general's help might perchance arrive too late! However, I was in for it; and so, taking another draught of wine, and refilling my pipe—there's great philosophy in a pipe, as we all know—I awaited the result of my charming scheme as calmly as I could.

'It was not long coming. About half an hour after Marietta's departure the door was slammed open, and I found myself sprawling and kicking, or rather sprawling, and trying to kick, for they wouldn't let me, in the arms of five or six ugly rascals, who, showering upon me all the time the vilest abuse, hurried me off to prison. Into it they thrust me like a dog; and there, when I could recover breath and speech, I greeted Pedro, my fellow-prisoner. The alcalde and Ramez had only *promised* to release him, and of course, when the object was gained, refused to abide by the bargain. If I had not been the most consummate ass that ever browsed or brayed, I might have guessed as much. Ramez had now two victims, and that promised a *double* holiday.

'Well, gentlemen, this was, you may suppose, a very unpleasant situation to find myself in; but as, thank Heaven, I was never much troubled with nerves, I did not so much mind it after a bit. Marietta, I was sure, would be off to the general with her best speed when she saw the ugly turn matters were taking; so that if my captors were not in a very patriotic hurry indeed, there was a chance on the cards yet. Pedro obtained some cigars of the jailor, an old acquaintance of his; they were first-rate, and we both became gradually calm and composed. Ah, gentlemen, I have often thought that if the moral observations I addressed that evening to my friend Pedro, upon the duty of respecting national prejudices, particularly with regard to sheltering wounded foreigners, and the shocking folly of making rash engagements with young women, especially after dinner, had been taken down by a short-hand writer, they would have raised me to the next rank after Solomon!

'No doubt of it,' said Tape, looking nervously at the clock: 'but do get on, captain; don't stop, *don't!*'

'I will not, Tape; but don't you hurry me as they did. Well, the next day I was dragged before the alcalde and that rascal Ramez, where, to my very great and most unpleasant surprise, two men, guerilla soldiers, swore that they had frequently seen me in communication with the French outposts, and that they verily believed me to be no other than the infamous Henriquez. Vainly I protested, finding the thing was getting much too serious, that I was an English officer: my assertions were laughed at, and I was reconveyed to my dungeon, after having heard myself sentenced to be shot at the same hour which was to see the last of Pedro. Mr Tape, please to touch the bell. I'll take another cup; for my tongue always feels dry and hot when I come to this part of the story.'

Mr Tape did as he was desired quickly, and bade the waiter who answered the summons 'jump about.' The anxious haberdasher had but just three minutes to spare.

'That, gentlemen,' continued the captain, 'was a very uncomfortable night. I was never, from a child, particularly fond of water-drinking; but I remember crawling off the straw many times during the night, and almost emptying *both* pitchers. At ten o'clock we were to suffer, to be shot to death by half-a-dozen rusty muskets. It was dreadfully aggravating! Day dawned at last; six seven, eight, nine, *ten* o'clock tinkled through the jail; the door opened, and in stalked Ramez and the alcalde, followed by the rusty shooting-party. We were politely informed that 'time' was up, and that we must both come to the scratch at once, as the spectators didn't like to be kept waiting. They then kindly pinioned us, and away we marched. You never perhaps walked in your own funeral procession, Tape, did you?'

'Lord, Captain Smith, how can you ask such a horrid question?'

'Well, if you ever should, you'll remember it, that's all. Seeing King Lear is nothing to it, though that's reckoned pretty deep. On we marched, the priests praying, the bells tolling, and the infernal musket-men eyeing us as if to make up their minds exactly where to have the pleasure of hitting us. One scoundrel with a short, ugly snub of an apology of a nose, meant, I could see, to send his bullet through my Roman. Altogether, it was the most disagreeable walk I ever took in my life. We soon arrived at the place of sacrifice, and were ordered to kneel down. "Pedro," said I, "that jewel of a wife of yours has played us a sweet trick; but perhaps she'll arrive in time, if she comes at all, to return thanks for all the good things we are about to receive; and that's a consolation anyway." I then took another look in the direction in which the expected succour *ought* to appear, when I saw, and tried to rub my eyes with my elbows to make sure I saw, but couldn't, a horsewoman on the summit of the hill: it was Marietta! I roared out like a raging bull, and Pedro gave chorus. As soon as Marietta caught sight of what was going on, she curbed her horse sharply back, and beckoned with eager gestures over the hill. A minute afterwards the ridge was crowned by half a regiment of British dragoons. The instant they saw us, they gave one loud cheer, and came on like a whirlwind.

"A narrow escape, Smith!" said the commanding officer. "But come, mount at once. There is a large French force in the neighbourhood, and the general's orders are not to halt an instant." I was delighted to hear it. The less said was, I felt, the soonest mended. If the general, thought I, were informed *why* he had been put to this trouble and risk, our meeting would scarcely be a very amicable one. "Who is this?" said the officer, pointing to Pedro, who, though he had hallooed lustily, was by no means yet out of the wood. "One of ours," I boldly replied. "Then mount, my good fellow, at once," replied he, motioning to one of the led horses. Pedro understood the gesture, though he didn't the language; and giving Marietta, who had unpinioned him, one hug, was in the saddle in a jiffy. "Out of the way," cried the commanding officer to the alcalde, who, instigated by Ramez, was approaching to claim Pedro at least as lawful prize. "Out of the way, fellow!" and he struck him sharply with the flat of his sword. The frightened functionary tumbled out of our path; the bugle sounded, and we were off, safe, sound, and merry.

'Bravo!—Hurra!—Hurra!' resounded in irregular chorus through the room. Tape was off like a shot: the unfortunate man was full seven minutes behind his time.

'Gentlemen,' said Captain Smith, after the applause had subsided, 'do not, if you please, forget the moral of my story. Everything, the chaplain used to say, has a useful moral—even short rations—though I never could agree with him to that extent. The moral of this adventure I take to be this—*Never, under any circumstances,*

assume to be what you are not; for if shot or hanged in a wrong character, you will never be able to amend the "errors of description."

LONDON AND EDINBURGH POST NINETY YEARS AGO.

IN April 1758, a body of merchants and traders in Edinburgh and other parts of Scotland presented a memorial to the annual committee of the Convention of Royal Burghs, proposing an improvement in the posts between London and Edinburgh, and Edinburgh and London. This document, of which a printed copy lies before us, sets out with deploring that, 'by some inattention, or by some improper dispositions made about the time of the Union, or before that event, when the trade and intercourse between England and Scotland was very small, and the postage of Scotch letters unable to defray the charge, it has happened that in no well-regulated country is the course of the post so tedious and ill-conducted as that from Edinburgh to London.' There were but *three posts a week*, and their arrangements are described as follows:—

'The great north mail sets out on Tuesdays, Thursdays, and Saturdays, at twelve at night, or rather an hour later, and arrives at Edinburgh on the afternoons of the Saturdays, Mondays, and Wednesdays thereafter. [From another part of the memorial, it appears that the mails reached London on the average at 4 P.M. of those days.] This course is performed, at a medium throughout the year, in about eighty-seven hours. But five hours or thereby are lost by the mail turning out of the straight course twelve miles, in order to pass through York, and by delay at that place: so that the course might as easily be performed in eighty-two hours, which would bring in the mails to Edinburgh about five hours sooner on the respective days.

'The mail from Edinburgh to London sets out on Tuesdays, Thursdays, and Saturdays at twelve at night precisely, is detained unnecessarily three or four hours at Berwick, the same time at some other stages in Northumberland, lies generally about twenty-four hours at Newcastle, turns off the road again twelve miles to pass through York, and is also detained there for several hours. By all which delays the whole course is not performed in less than about five days and a-half, or 131 hours; so that it does not arrive at London sooner than about eleven o'clock forenoon on the Mondays, Wednesdays, and Fridays respectively after the departures above-mentioned.'

The memorialists proposed that, by change of hours of starting, a saving of stoppages at Berwick and Newcastle, and keeping the straight road by Boroughbridge, instead of turning aside to York, they should *save two days* on the road from Edinburgh to London; by a similar means, they thought five hours might be saved between London and Edinburgh. 'The cities of London and Edinburgh will thereby,' continue the memorialists, 'receive returns of letters from each other in seven days and a-half and eight days and a-half, which at present do not come sooner than in ten days and a-half and twelve days and a-half.'

This memorial was successful so far that, in April 1760, by a change in the hours of starting and other arrangements, *two days* were saved upon the post from Edinburgh to London.

The post is now conveyed from London to Edinburgh in twelve hours and a-half, so that the morning papers published in the metropolis may be read in Edinburgh at night. By means of the electric telegraph (not so perfect as it will yet be), messages are transmitted between the two cities in less than an hour. The following circumstance, which occurred a few weeks ago, contrasts singularly with the return of post in the eight days and a-half which would have pleased our ancestors ninety years ago:—A banking company in Edinburgh being desirous to buy of a particular stock in London, sent off orders to that effect at ten in the morning, mention-

ing a certain price as the highest at which they wished to invest. An answer was in the office by twelve noon, to the effect that the stock in question could not now be got at that price, but mentioning a somewhat higher rate at which it was offered. A second message was despatched, agreeing to this price, and at two o'clock the reply, announcing the completion of the bargain, was in the hands of the manager.

SOCIAL MORALITY.

SOME years ago the public mind was startled by the announcement in Mr Chadwick's able report on Interments in Towns, of various aggravated cases of infanticide by parents at Stockport for the sake of obtaining insurance fees from burial clubs. Here was cannibalism in a new form, so horrifying, as to exceed belief: the facts, however, were but too well substantiated, and remained a blot upon modern civilisation. More recently,* rumour has been rife as to a growing crime of poisoning among the rural population, a portion of the community generally considered as too unsophisticated to think of, much less resort to, such deadly means of destruction; and within the past few months the public prints have been occupied by the details of cases of poisoning not less appalling than those above referred to at Bristol and Harwich—the number of victims in the latter instance being set down as sixteen, all poisoned for the sake of burial fees. In the other case, a husband poisons his wife to obtain a large insurance effected on her life.

It would appear that society requires to be roused from time to time by the protrusion of such enormous facts, in order to become unmistakably aware of the fearful amount of ignorance, misery, and crime, seething in its lower strata. The awful certainty staggers us, brings us to a dead stop—we seem suddenly to have taken a long and retrogressive stride, and looking round in amazement for the fruits of past and present philanthropy, ask what has become of the efforts of the humane and the benevolent, so long pursued? Is endeavour to be thus thrown away? What does it mean? Is it a fault—a something that can be corrected, to which a remedy may be applied? Or is it an evidence of an unnatural condition of society, impervious to the genial and humanising influences so beneficial in other quarters? Is it a case for legislative interference; or must it be left to time, which, in the words of Lord Bacon, 'innovateth slowly?'

Disguise them as we may, facts will still be facts. The average amount of criminal offences—the effect of passion—in England and Wales is 700 annually, of which 450 come under the head of murder and other attempts on life; but with secret poisoning on the increase, we may expect a corresponding augmentation of the average, the more so as the temptations to the committal of the crime appear to be great. The returns from Preston have been cited as exhibiting the results of foul play. In that town more than 20,000 persons, chiefly, if not exclusively, belonging to the operative population, are enrolled in burial clubs. On insuring a child's life, twelve or sixteen weekly payments must be made before any benefit can accrue; healthy lives only are insured, to guard against loss as much as possible to the club fund; and during this period the rate of mortality among the children on the books is 6·4 per cent., while in the town at large it is 10·4 per cent. But no sooner has the preliminary term passed, than there follows an increase in the proportion of infantile deaths, which rises to 8 per cent.—a fact inexplicable by natural causes; one that marks the existence of a deep under-current of ignorance or crime.

The sum insured for is, in frequent instances, much greater than is necessary for the interment of a child

* This paper was written some time ago. It may be added that the writer was originally a working-man.—Ed.

—sometimes L.8 or L.9; and when, as often occurs, the insurance has been effected in three or four clubs, the total to be received may amount to more than L.20. Before this temptation the instinctive feeling, love of offspring, disappears; and without any attempts that may be set down as positive ill-treatment, the child dies. The process brings out no bruises or broken limbs: systematic neglect, and the administering of opiates, the use of which is so flagrant in the manufacturing districts, to say nothing of hiring nurses, soon complete the business. The demoralising effects of such a state of things are too obvious to need further insisting on.

Have we not here an intimation that the 'march of mind' has been overstated? The writer of this article has lately had an opportunity of revisiting some of the northern manufacturing towns with which he was familiar twenty years ago. At that time his views and feelings were identical with those of the toiling, but unreflecting multitude—their wild theories were received as true principles of action. So little change has taken place in this interval of nearly a quarter of a century, that it might almost be thought they are the same people, forgotten by Time in his flight. There is the same improvidence—the same eagerness to swallow crude doctrines—the same readiness to believe that ameliorations must commence from without, and not from within; in short, a condition of mind and character utterly incompatible with the idea of real progress. It is not denied that many appliances which mitigate hardship, and enlighten and enliven domestic life, are more within command than formerly; but from the grand desiderata, the perception of right and wrong—the proper sense of what is due to others—the desire to aid the common cause by self-sacrifice or exertion—from these we appear to be as far as ever.

To this slow awakening, this tardy assimilation of sound views and principles, we may attribute that state of things which produces lamentable offences against every social and moral law. And before any favourable change can take place in these underlying masses, it is pretty clear that there must be a notable development of the moral faculty, accompanied by a teachableness of disposition, without which all extraneous efforts will be nugatory. The prime evil is indifference, or, in other words, intense apathy, in whatever relates to spiritual culture. Marvellous, that while men and women will toil day after day at the factory, workshops, loom, or needle, with praiseworthy assiduity, they are at the same time so prone to shirk those endeavours on which, more than anything else, their wellbeing depends. Mere neglect is not the worst of it; for the habit of neglect tends to a degradation which has no sense of its depravity, and in which whole communities will be content to 'get along.'

The cry for legislative action is very often raised by those most indisposed to individual exertion. Authoritative interference in the details of private as well as public life would speedily reduce society to one dreary uniform level, of which a specimen may be found in certain French theoretical works. We can hardly be wise, just, or virtuous by proxy; a people cannot be improved by shifts and expedients, but by promoting among them habits of forethought and self-reliance: these are the best guarantee for domestic as well as patriotic virtues. The disposition to consider that collective good can result without individual regeneration, would be simply absurd, were it not fraught with mischief. The truth of this proposition will scarcely be denied by those who have watched the course of events during the past few months. Wherever a speaker has come forward to inculcate the doctrine of self-help, how has he been received?—with derision. It disturbs one's self-esteem to be told that reform must come from within, and noisy clamour rises to a premium. Governments, it is true, may be responsible for a misdirection of the national energies, but this in no degree diminishes individual responsibility.

It is sad to think that even the press has in some instances fomented the social mischief. There appear to be certain writers who systematically inculcate the doctrine that all who possess anything are little better than robbers, and that all who have nothing are oppressed. According to their theories, every man with a decent coat on his back is necessarily a tyrant, and every poor man a suffering saint. In no respect do these writers inculcate the principle which lies at the foundation of man's destiny, that every one of us must in some shape toil for our daily bread. The necessity of self-reliance is never heard from them. Their notion is, that everybody should have something done for him, as if the mass were not under any obligation to think, but were born into the world to be nursed, coddled, and flattered by the few.

The temper of the times has rather aided than opposed these wild theories. From a period of severe, and almost savage penal infliction, along with a general disregard of suffering in almost any form, the world has latterly gone to an opposite extreme, and in a spirit of beneficence, unregulated by a prudent consideration of circumstances, has presented innumerable temptations to discard self-respect and self-reliance. There can be no doubt that the well-meant efforts of the benevolent have in various instances been actually demoralising. Our prisons, with their elegant repose and comfort, are unquestionably creating criminals; our Night Asylums are creating universal vagrancy; our Schools of Industry, we fear, are encouraging juvenile street mendicancy. To whichever side we turn, we find all sorts of means for assuaging, as is believed, crime and misery. These things, we are told, are necessary, and we are not disposed to debate the point; on the contrary, we would go every length in the way of kindness and humanity. But if necessary, they must be proper; and how does it come that what is necessary and proper is productive of evil? The reason simply is, that we depend upon them alone as remedies, whereas they must be accompanied by something more, or else remain worse than nugatory. The evil lies deeper than any point they of themselves can reach, even if their administration were wise and prudent, instead of being quite the reverse. The lower departments of society are, as we have said, not in a right condition morally; and till we can get that remedied, things cannot be expected to mend. Were we to give them all the wealth and power in England, and yet leave their mental operations what they are, it would be doing no good. What, then, is to be done? This is not easy to say; but one thing is pretty obvious, that without a universal system of instruction, all else is vain. Education, however, cannot be made altogether compulsory, though a different feeling is beginning to prevail; and we are inclined to believe that, without something more than solicitation, there will be no substantial advance. Having in view the great good accomplished by personal visitations—those of Mrs Fry and Sarah Martin may be instanced as the most memorable of late years—it becomes a question whether a system of house-to-house visitation, in such town districts as most require it, could not be made a most powerful branch of educational tactics. There are thousands who cannot read, and thousands who will not read, who are yet willing to listen to reading or conversation. The instructors should be zealous and patient, and the instructions should embrace the details of family training and domestic economy, and whatever incidents of life admit of regulation. Let it not be considered as interfering with the business of the missionary, but only as supplementing it, or preparing the way for it. For a large class of females of the middle and upper circles we can imagine no more fitting employment. The scheme might be tested in one town or parish: if successful, the wider application of it might readily be made to extend to counties, and so on to the whole kingdom. The duties which it would involve are not of the showy kind, not such as come before the world with a flourish

of trumpets. But of its promise, and of the solid happiness to accrue from its operation, there can be little question. In short, the cry must be—Educate, educate, educate!

THE MARQUIS D'ALIGRE.

THE Hôtel Aligre is situated in the Rue d'Anjou-Saint-Honoré in Paris. This street is one of the most aristocratic of the capital; its large and fine houses are inhabited by the representatives of royalty, and by many of the noblest families of France. In the centre of these handsome buildings stands the Hôtel d'Aligre, the exterior of which is plain and unpretending; a large clock in the pediment causes it often to be mistaken for a public edifice. The house is of a more pleasing aspect, however, on the side looking towards the garden, which latter is large, and adorned with fine trees; but taken as a whole, it ill corresponds with the sumptuous magnificence of the interior. Within, the apartments are decorated, and furnished with a profusion and splendour surprising to any one acquainted with the economical, not to say penurious, habits of the founder of this house.

The Marquis d'Aligre, who has left no inheritors of his name, was one of the most universally known men in Paris, enjoying a twofold celebrity by his immense fortune, and by his reputation for avarice, which at length almost passed into a proverb. In the excess of his parsimony, Monsieur d'Aligre was often heard to complain bitterly of being obliged to pay 60,000 francs (L.2500) yearly in taxes; 'a sad necessity, which would ruin him,' he said. Poor man! His income exceeded two millions of francs (L.80,000). This colossal fortune was formed by slow accumulation, by clear habits of business, and by the extreme care bestowed through several generations in preserving, economising, and increasing the family inheritance. The D'Aligres can only boast a genealogy of two centuries. Their first ancestor of distinction was chancellor of France under Louis XIII., and another of the same name filled the same office in the following reign. The father of the last marquis was the first president of the Parliament of Paris. Foreseeing the Revolution and its terrible consequences, he resigned this post; and gifted with that instinct of conservatism which has established and maintained the wealth of his house, he speedily converted all his available property into gold, placed it in the English funds, and lost no time in following his money.

Having saved his fortune, he soon saved his person, so that the miseries of that period of emigration were unknown to him. He had to suffer no privations but those which he imposed on himself voluntarily with parsimonious heroism. The D'Aligre of that day was the greatest miser of the family; and, compared with him, his son was dissipated and prodigal. But the present generation, who knew nothing of the father, attributed many of his acts to the son, and among others, the famous register kept by him in the emigration.

In London, many of the French exiles, aware that the President d'Aligre had cleverly managed to bring his riches with him, often profited of the privileges of rank and misfortune to ask him for loans; and the following, among many such scenes, is a good illustration of the fruitlessness of their solicitations. The only servant of the old marquis opens the door and announces the Duke de —, who, unmindful of his seedy habiliments, enters with the free and confident manner of a man of the world.

'Ah, good morning, my dear marquis! I am glad to see that your precious health continues good.'

'Why, yes, my dear duke, I feel pretty well: that comes from my regular habits, a great deal of exercise, and, above all, strict temperance.'

'Which with you is only a matter of choice, and in noways compulsory. Every one cannot say so much; and it is precisely on that subject I have come to visit you.'

'What! on the subject of sobriety?'

'Yes indeed; and it is in order not to be obliged to practise it in excess that I make a demand on your kindness, and beg you to lend me ten thousand francs.'

'Ah, very well. You ask me to lend you four hundred pounds?'

'You will do me a great favour.'

'Excellent!'

And the marquis rose, opened his secrétaire, took out an enormous register, and wrote down the duke's name, placing after it the figure of ten thousand francs; then quietly resumed the conversation.

'Hyde Park was much crowded yesterday. They talk a great deal about the new *danseuse* at Drury Lane. Do you know that the beautiful Lady E—— was the belle at the last Almack's?' And so on with twenty other trifles.

At length the duke touched again on the subject of the loan.

'I am really sorry, my dear fellow,' replied the marquis: 'I find it impossible to lend you this money.'

'What!' cried the astonished duke; 'you surely put me down in your register?'

'Oh, rest easy as to that: I did not write your name as a debtor, but merely as a *demandeur*. It is a simple formality, which I go through for my own satisfaction, and which serves to justify my refusal. Just take the trouble to look through this register, and you will understand me.' Then opening this large book before the duke, M. d'Aligre continued: 'Here I have inscribed all the demands for money made to me since the commencement of the emigration. The names are authentic. See how all these large pages and long columns of figures are closely filled; verify the additions, and you will find the total, up to this day, amounts to nearly three million francs. Where should I now be had I satisfied all these demands? Long since reduced to beggary. And why should I give to one what I could not give to all? It would be unjust and injurious, and would expose me to constant quarrels. So, liable as I am to these incessant demands, I have been forced to adopt a system of general refusal; and this register, as I said before, will explain and justify my present conduct.'

Thus finding it impossible to combat such an invincible resolution, the noble borrower departed as he had come.

In this way the wealthy exile, though in receipt of an enormous income, paid to the day by the Bank of England, avoided assisting his companions in exile, the greater number of whom were plunged in the utmost distress.

It is not right, however, to attribute this act to the late marquis, who had enough of his own misdeeds to account for, without making him answerable for those of his parent. With the fortune, he inherited the paternal habits of economy, and numerous were the anecdotes related of this hereditary avarice in the first circles of Parisian society. Yet M. d'Aligre, although parsimonious in the necessities of life, and following in most things his old habits of penury, had an expensive mania: he was fond of objects of art—statues, bronzes, jewellery, precious stones, and curious furniture, and of these formed a magnificent collection in his hôtel in Paris. His apartments, open to visitors, had the effect of a museum. They consisted of a mass of gems of every description—*Boule-work*, porcelain of Sèvres, Saxony, and Japan, carved wood, ivory, mosaics, Raphael-ware, terra-cotta, marble statues, vases, goblets of porphyry, oriental agate, lapis-lazuli, serpentine, jasper, and rock-crystal; all which has been recently set up for sale, despite the scarcity of money, and the immense value of the articles.

It was matter of surprise to many that the family should order these treasures for sale at such a moment, and especially that a statue of the late Marchioness d'Aligre, as large as life, and of solid silver, was included in the catalogue. But it soon became known that this

portion of the inheritance belonged to an hospital, richly endowed by the deceased marquis, and to which he bequeathed, by a particular clause in his will, 'everything contained in the ground-floor storey of his house at the hour of his death.'

This legacy reminds me of an anecdote which made considerable sensation in Parisian society some time since. A rich lady bequeathed her country-house, with all its contents, to her attorney. He, having drawn out the will, was aware of the legacy, and hence took good care to embellish the villa according to his fancy—no difficult matter to him, as he exercised unlimited control in the establishment of his benefactress. During her last illness especially, he removed all the most precious objects of art to this country-house, the best furniture, and the valuable collection of paintings which decorated her town residence and her other country seats, and thus became the lawful possessor of his splendid spoils.

No abuse of this kind occurred in the legacy to the hospital; yet the heirs of the Marquis d'Aligre disputed the bequest, on the pretext that the ground-floor of the hôtel contained many objects which it never could have been the intention of the testator to leave away from his family. The case was tried, and the hospital was successful. It now possesses the silver statue, the ornaments, diamonds, family portraits, exquisite miniatures, five hundred medallions of beautiful female portraits, and an extremely curious anatomical collection.

NATURAL HISTORY OF BLIGHT.

AMONG the diseases of plants, blight is one of the most important, and at the same time one on which a great diversity of opinion prevails. The Greeks and Romans supposed it to arise from the wrath of the gods, manifested in some sort of atmospheric influence; and the Hindoos of the present day consider it a judgment upon the country for the profane eating of beef. Gardeners see it 'coming in the air,' and look upon the insects they find soon after devouring their crops as a consequence of the blight; while those who consider themselves more philosophical observers, laugh at the notion of atmospheric influence, and attribute the whole mischief to the entomological enemies of human industry.

Perhaps both theories may be to a certain extent correct. The state of the atmosphere cannot produce insects, but it may occasion their development and multiplication; just as blight, from the parasitic fungus commonly termed rust, may arise from the farina of the parasite being carried to the destined victims by the wind, at a time when the pores of the plant are more than usually open. In Upper India, where the blights from this cause produce all the horrors of famine in vast districts of the country, it is observed that the mischief occurs during an easterly wind. The particles floating in the air which are carried at such times over the wheat crops, penetrate into the open pores, and spreading their minute roots, intercept the sap in its circulation till the plant sickens and dies. 'I have sometimes,' says Colonel Sleeman, 'seen the air tinted of an orange colour for many days by the quantity of these seeds which it has contained; and that without the wheat-crops suffering at all, when any but an easterly wind has prevailed; but when the air is so charged with this farina, let but an easterly wind blow for twenty-four hours, and all the wheat-crops under its influence are destroyed—nothing can save them! The stalks and leaves become first of an orange colour, from the light colour of the farina which adheres to them; but this changes to deep brown. All that part of the stalk that is exposed seems as if it had been pricked with needles, and had exuded blood from every puncture; and the grain in the ear withers in proportion to the number of fungi that intercept and feed upon its sap; but the parts of the stalk that are covered by the leaves remain entirely uninjured; and when the leaves are drawn off from them, they form a beautiful contrast to the others,

which have been exposed to the depredations of these parasitic plants. Every pore, it is said, may contain from twenty to forty of these plants, and each plant may shed a hundred seeds, so that a single shrub, infected with the disease, may disseminate it over the face of a whole district; for in the warm month of March, when the wheat is attaining maturity, these plants ripen and shed their seeds in a week; and consequently increase with enormous rapidity, when they find plants with their pores open ready to receive and nourish them.* Colonel Sleeman adds that he had seen rich fields of uninterrupted wheat cultivation, extending over an area of twenty miles by ten, in the Valley of the Nerbudda, so completely destroyed by this kind of blight, that even the stalks and leaves were considered unfit for fodder.

In England, the disease which is caused or increased by webs and soft insects is popularly called a 'blight'; while that in which snails and hard insects are the proximate evil-doers is a 'sneq.' The former comes in a warm south-east wind, and the latter in a cold north-east wind—both of which vehicles, according to a very amusing volume before us, have about as much to do with the vegetable disease as with a rise in the funds.† The volume has a good deal of the air and character of the famous 'Natural History of Selborne;' and, together with other instructive and entertaining matter, it contains a great variety of information respecting the various insects whose depredations are set down as the real blight in plants.

The gooseberry-fly, which collects such heavy tithes of one of the wholesomest of our fruits, is a pretty and merry insect, which spends its brief life in sporting with its companions in the sunshine. Marriage, however, spoils his amusement and injures his morals; for his progeny are deposited where they have no business, the eggs dotting the back of the leaves, at regular intervals, like bead-work. In about a week the grubs come forth head foremost, leaving the skins of the eggs standing 'like a row of empty silver purses,' and straightway they begin eating; and this with such effect, that their first meal changes their smoke-coloured vest into

'A doublet of the Lincoln green.'

There are sixty or seventy of these devourers on one leaf; and as *each* grub will eat three leaves to his own share before he is satisfied, by destroying one leaf in proportion you save a couple of hundreds. If let alone, however, the grub goes on eat—eat—eating, without a moment's intermission, till he is about half an inch in length: here he pauses, apparently for want of skin-room. His black head separates like a mask from the neck, and splits down the middle, and a new head pops out of the opening, with which he looks about him, moving it slowly on all sides, and without any vulgar expression of surprise or other excitement. Being satisfied as to the locality, he next wriggles out his body; and having at length got fairly rid of the insufficient skin, he sets to work to fill the new one, eating without intermission for four or five days more. At the end of this time he casts his skin again, and comes forth of a pale, delicate, green colour. He eats no more. He descends to the earth, and burrowing in it like a mole, to a depth of from two to eight inches, he makes a little oblong cell, and surrounding himself with a tough black cocoon, awaits tranquilly his transformation into a chrysalis, and soon after into a fly. When the eggs are laid before the middle of May, the whole of this history, down to the appearance of the fly, comes within a space of about twenty-eight days; but when the eggs are late in the year, our grub does not think it worth his while to come forth from his subterranean abode, but dozes comfortably in his cocoon till the ensuing

* Rambles and Recollections of an Indian Official. By Lieutenant-Colonel Sleeman.

† The Letters of Rusticus on the Natural History of Godalming. London: Van Voorst. 1849.

spring. If any gardener is so inhospitable as to desire to save his gooseberries from this amusing visitor, the best way would appear to be to beat down and harden the soil all round the plants, so as to convert his temporary retirement into a perpetual imprisonment.

The gooseberry-fly, however, is only a blight—he is not the blight. The generic name of the latter is the aphid, and it is a dull, stupid-looking creature, who does not go through the ordinary insect metamorphoses. The aphides have usually only one parent, and are sometimes enclosed in an egg, and sometimes not. They stick their beak into the plant on which they are born; and after sucking away for a few days, begin to bring forth young spontaneously, and continue to do so for months, at the rate of from a dozen to a dozen and a-half a day. It may be supposed that the stalk of the plant is very soon pretty nearly covered; and by and by the new-comers, seeing nothing but a living mass around them which they cannot eat, look a little puzzled what to do. But after an hour or two's meditation they comprehend the affair; and creeping along the backs of their tribe to the upper end of the shoot, they settle down on the outskirts of the colony. Towards autumn a change occurs in their nature. Their feet stick firmly to the plant, and their skin opening down the back, a winged creature comes forth, and begins to sport with his companions (now male and female) in the sunshine. More wonderful than all, a solitary individual of the new tribe may be seen here and there retaining the united functions of father and mother, and surrounded by a green and wingless progeny, itself being winged, and nearly black. 'These are mysteries,' says our author, 'which I leave you entomologists to explain. In May, a fly lays a lot of eggs; these eggs hatch and become blights; these blights are viviparous, and that without the usual union of the sexes, and so are their children and grandchildren—the number of births depending solely on the quantity and quality of their food. At last, as winter approaches, the whole generation, or series of generations, assumes wings, which the parents did not possess, undergoes frequently a change in colour, and instead of being viviparous, lays eggs.'

Although the wingless aphides are dull and stupid little creatures, they are great pets and nurslings of the ants, who tend them like a flock of sheep. When they meet them out of doors, they take them round the neck, pat them on the back with their antennæ, lick them with their tongues, and carry them gently and carefully into the recesses of their nests. Our Godalming naturalist attributes all this affection to a drop of honey-dew, which he supposes to be secreted in the aphids; and he has watched an ant going from one of her flock to another, and standing behind him, squeeze the body with her fore-legs, and swallow a small drop of honey, which is the result, as clear as crystal. He says it is very sweet, as well as clear, but does not aver that it has the same scandalous effect upon the old lady as the potatoes of the humble-bee upon that more dissolute personage. 'The humble-bees on a sunflower are also very odd-mannered: they get as drunk as Bacchus or Silenus; then they get sleepy as Morpheus, and cross as Cerberus; if you touch one, he leans on one side, cocking up the opposite legs into the air, and plays divers other antics, till, with his various trials to show that he is *compos mentis*, and able to fight and defend himself, he sidles, staggers, rolls, and falls to the ground, and there lies on his back till he has slept himself sober.'

The hop-fly must be considered the most economically important of the blights of the aphid class, as the sum of which he defrauds the treasury amounts occasionally (actually in 1825) to something not far short of half a million sterling. This, however, merely concerns the duty; for the fluctuations in the market (which is an immense gambling concern) are at least twenty times that sum. The hop-fly makes its appearance from the 10th to the 30th of May; and, what is not

a little curious, it appears on the same day in the four great hop districts—Kent, Sussex, Farnham, and Worcester. The fly very soon produces deposit or knits, which are its young, and these in a few days become green lice. The lice in turn produce knits; and so on knits and lice, lice and knits, till among them the plant is killed, and the destroyers die with it.

But this aphid, deadly as it is, has enemies as deadly of its own. Of these there is a minute ichneumon, which, watching its opportunity, deposits an egg in the body of the hop-fly. The grub thus introduced devours the whole interior of its victim, and in a few days opening the skin (which supplies the place of a cocoon), darts forth a winged insect. The skin in the meantime frequently shuts again as with a spring, and observers wonder how the animal it enclosed could have got out. Another enemy is the lady-bird, with its caterpillar, 'a queer-looking insect, like a fat lizard,' which feeds on its victims so voraciously, that a single grub devours above forty in a day. Another is a 'green, ungainly-looking grub, without legs, which lies flat on the surface of the leaf,' and stretching out its neck like a leech, seizes the aphid with its teeth. Another is a ferocious assassin-like fellow, strutting on six legs, and carrying about with him the skins of the aphides he has destroyed, as ostentatiously as the Indian does his scalps.

Another curious blight is called the American—probably for no other reason than that it looks like a bit of cotton-down floating upon the wind. If you penetrate into the mystery of this cotton, you find a plant-louse in the middle; and a louse of taste, who prefers rose-bushes and other agreeable shrubs. When driven against an apple-tree, however—for he has no option as to his whereabouts—he creeps contentedly into a crack in the bark, and founds a colony, whose cotton jackets appear in large bunches, and spread from branch to branch till the tree perishes. No one can tell how this result comes about, but the fact is beyond dispute. The cure recommended is a dose of double size, applied to all the cottony spots with a plasterer's brush every morning for a fortnight.

The apple-weevil, another enemy of the orchard, is at first a very amiable personage, like the gooseberry-fly. Crawling up to the twigs from their winter quarters, they look about them, stretch their cramped legs, wash their face, as a cat does with her paws, unfold from comparatively small cases two large transparent wings, and dart in merry groups into the air. By the time the lady weevil is ready for laying, the apple buds have burst, and are ready to receive the egg. She perforates a hole with her trunk in the blossom she chooses, and depositing there a single egg, flies off to repeat the operation elsewhere, and so on till her whole store is exhausted. The eggs soon burst, and produce a little white limbless and wingless maggot, which at once begins to eat its commons, and continues till it has arrived at the fruit, and devoured a portion of it. It then casts its skin, becomes a chrysalis, and lies still till it is transformed into a beetle. The tom-tits, sparrows, and bullfinches, which the gardeners do all they can to destroy in the spring, feed on these weevils, and are the natural protection of the orchard.

The apple-moth is 'a beautiful little creature; its wings are studded with silvery shining specks, as though they were inlaid with precious gems.' It deposits a single egg in the eye of the apple, and the grub, when hatched, eats obliquely down towards the middle, avoiding the hard core and seeds. It keeps the little hole by which it descended clear, that it may clean its house and throw out the rubbish; and when it has gained the middle, being well acquainted with the law of gravity, it makes a new hole for the same purpose downwards. When strong enough, it penetrates the core, devours the pips, and the apple, thus deprived of vitality, withers, and falls to the ground. The grub is perhaps alarmed—certainly astonished—and enlarging his hole, he creeps out to see what is the matter. But he can see nothing; for this occurs during the night, and he wanders about

in the dark, and perhaps gets to a tree, where he finds refuge in a crack in the bark. Here by and by he spins his cocoon, becomes a chrysalis, goes to sleep for the winter, and in the following June launches into the air, and begins a new round of existence in the character of a winged, painted, and glittering moth.

The mission of the little ermine-moth is to strip the hedges of their leaves, and mat together the twigs into a web—an offence commonly, and somewhat vaguely, charged upon the 'east wind blight.' The caterpillars of this creature, as soon as they are hatched, feed on the pulpy part of the leaves, but in a few days spin themselves a house, enclosing some leaves, on which they feed at leisure. When these are finished, they extend their dwelling so as to enclose others; and so on till, in fine, the whole hedge is stripped. When the fulness of time is come, they suspend themselves to their web with the head downwards, and turn into chrysalises, and then in the month of June into moths.

The turnip-fly is 'a little, glossy, tiny, skipping, hopping, merry-Andrew kind of a beetle,' but a most abandoned thief, who starves the sheep and cattle, and impoverishes their owners. They begin their attack upon the turnip as soon as it is up, and think nothing of leaving the field in a few days 'as brown as when it was sowed.' The turnip-weevil, the turnip-moth, and the turnip-aphis, are likewise bitter enemies of this useful esculent; but the Nigger is so remarkable a blight, that we cannot trust entirely to our own humble pen for his portrait.

'This year' (1835), says the Godalming naturalist, 'all our turnips are infested with these niggers. They are the caterpillars of a fly that ought really to be called the turnip-fly, a name which we have seen is universally given to the turnip-beetle. About the middle of July these real turnip-flies were showered down on us as it were from the clouds; they fell thicker than rain-drops, and hovered about the turnips in such myriads, that whole fields were coloured with a rainbowy tinge when the hot sun shone on their filmy wings. I will give an entomological description of one of these flies: the head and antennæ are coal-black; the thorax is yellow before and on the top, but coal-black on the sides and behind; the body is yellow; the wings are clear, and very shining, and tinged with yellow, and the upper ones have a dash of coal-black along the upper margin, which reaches three-quarters of the way from the thorax to the tip of the wing; the legs are yellow, spotted with black.' These flies deposit their eggs on the under side of the leaf, and when the grubs are hatched, they begin their work. Our author visited a field on a Saturday. 'On Monday I was again in the field at Old Pond, and the turnips were not. Since my last visit, they had been swept from the face of the earth. The land was everywhere as bare as on the day it had been sowed: there was no speck of green for the eye to rest on. It was a wild and universal desolation; and the black, crawling vermin that had caused the ruin were clustered in bunches on the ground, or lingering about the skeletons of the turnip leaves. No plague of Egypt could have been more effective: the mischief was complete. Some fields received the blast a few days later than others, but all had it: not one escaped, unless the crop were Swedes, and it is remarkable that these were untouched. . . . Directly the young nigger is let out of the egg-shell, he begins eating away in right earnest. The first onslaught is generally made as near as possible to the spot where he was born, but after a day or two the edges of the leaf seem to be most favoured by his attentions; and here the whole family may be seen working with a will, their heads at the work of demolition, and their tails cocked up in the air. In an incredibly short space of time the green of the leaf is gone, and nothing is visible but the naked skeletons of veins, which the niggers do not choose to consume. The colour of the grub is a dull lead colour, with a rather rough or wrinkly skin, but without hairs; and down each side, from stem to stern, is a paler line:

its length, when full grown, is between half and three-quarters of an inch; it has no less than twenty legs, six of which are placed in three pairs, very near the head. These six are long, hard, horny, and sharp-pointed, and with them the grub holds fast the edge of the leaf while he goes on devouring it; the other fourteen legs are arranged in seven pairs along the body, and are soft and fleshy, without any horny substance, and quite without sharp points. These legs are used when the grub is crawling; but while he is eating, and the tail—indeed the greater part of the body is, as I have already said—cocked up in the air, they are quite unemployed. Sometimes, and especially when offended or in danger, the nigger grub coils himself up in a ring, holding the leaf very slightly by the first pair of legs, that pair next the head, and when touched in this state, falls directly to the ground, and there lies as though dead; indeed, if not in a ring before, he almost always rolls himself into one when touched. When the nigger has reached his full size, a period depending on the temperature of the weather and the supply of food, but averaging at twenty days, he burrows in the earth, and there makes a little oval house, just big enough for his body, which has all at once become shorter and thicker; he then plasters the walls of this place with a sort of sticky varnish or glue, which he discharges at this time only. He keeps on discharging and spreading this glue till he is quite surrounded with a strong, tough, and hard cocoon, the particles of earth being mixed with the glue, and the whole forming an admirable and perfect defence against wet or the attacks of insects. The period of his stay in this cocoon varies according to circumstances; if the weather is hot, it sometimes happens that the grub becomes a mummy-like chrysalis in ten days, and a perfect fly, and again on the wing, in five more; but the greater part of the brood remain unchanged all through the autumn, winter, and spring. I have turned up the cocoons, and found the grub little altered even in May. Soon after this, the change to a chrysalis must take place; and the change to a fly occurs, in average seasons, about the middle of July. When this is accomplished, it moistens one end of its cocoon, so as to make it easy to come out, and then it climbs up through the earth and takes wing.'

Such are the principal 'blights,' and such the wonderful scene of production, destruction, and reproduction, which is constantly going on before our eyes. We do not pretend to fathom the purposes of the Creator; we only know that myriads of beings are produced which are intended for the food of other beings; and in order to save our crops from the ravages of those animals which are appointed by nature to destroy them, it would seem to be our wisest plan to give as much effect as may be in our power to this universal law. Instead of grudging the small birds a little food, our gardeners should cheerfully concede it to them, as allies in our task of destroying those creatures, which do more mischief in a day than the others in a season. In order to destroy the last-mentioned grubs, our naturalist says we have only to turn a flock of ducks into the field, which 'will devour the niggers by millions, and in a few days become as fat as butter.' Frogs and toads, if permitted, will gorge upon them till they can hardly move; and the maggot of a parasite fly, which lays its egg in the creature's back, descends with it into the earth, and after allowing the nigger to make its cocoon, eats up its entrails, and emerges in due time a fly. The tiger-moth caterpillar is produced in Great Britain in sufficient numbers to devour every green blade in the land, and thus deprive us at once of vegetable and animal food. But this caterpillar has so many insect enemies, that not one egg out of 50,000 produces a moth! This is sufficient of itself to show the plan of Omnipotence; although the purpose is beyond our limited comprehension.

We conclude by recommending the 'Letters of Rusticus' as forming a very amusing and instructive volume; in which Mr Newman figures as an interest-

ing variety of the species printer, by appending to the sheets he sends forth from his press sundry ingenious notes in natural history.

AMERICAN ICE TRADE.

HALF a century ago, to have asserted that ice would form an important item in commercial statistics would have been deemed absurd. Travellers, it is true, had told us of collections of snow made during the winter by the peasantry of the Apennines and Pyrenees for the cities of Italy and Spain in the sultry season; and we had tantalising accounts of the iced-water so profusely imbibed by dwellers in Eastern countries; but it was reserved for the ingenuity and enterprise of our neighbours in the United States, assisted by the severe winters of their climate, to find in the frozen surfaces of their clear blue lakes a valuable article of foreign as well as domestic commerce.

According to a statement in the 'American Almanac' for 1849, we learn that the ice trade owes its origin to a person named Tudor, who began it at Boston in 1805. He had caused inquiries to be made in the West Indies, and shipped his first cargo—130 tons—to Martinique in a vessel which he was obliged to buy for the purpose, as no shipowner was willing to receive the gelid freight. This experiment resulted in a loss; the trade was subsequently extended to Jamaica, Cuba, and cities in the southern states; but, from various causes, with little or no success.

In 1832, twenty-seven years after the commencement, the quantity of ice exported from Boston was not more than 4352 tons; other persons had embarked in the trade, but having failed, Mr Tudor was again alone. Among the causes of its slow increase was the imperfection of the appliances for carrying it on: ice was looked upon by shipmasters as a dangerous and damaging freight; there were no ice-houses at home or abroad for the preservation of the article; in addition to which, the mere mechanical details were but ill understood. But since 1832 these difficulties have been overcome, and there appears to be no insurmountable obstacle to a farther expansion of the late increase in the trade. Hitherto one pond, near Cambridge, Massachusetts, had contributed the entire supply; but in 1841 several Boston traders having entered into the business, a district of country containing 'ice privileges' was legally partitioned between them, whereby each one was enabled to obtain a good supply without detriment to the others. Maps of the respective localities are placed in certain public offices for reference as occasion may arise. The rapid growth of the trade may be judged of from the fact, that in 1847 nearly 75,000 tons of ice were shipped from Boston, employing 353 vessels of various burden. Twenty-eight cargoes went to as many places in the United States, and thirty-one to foreign countries; and the enumeration of Havana, West Indies, Rio de Janeiro, East Indies, Manilla, Java, China, and England, sufficiently indicates the wide extension of the trade.

By the use of ice, fruits, vegetables, and other perishable commodities may be exported, which otherwise would remain unproductive. Twenty-nine such cargoes, value 72,500 dollars, were shipped from Boston in 1847; the freight paid on the whole 74,478 tons of ice was 186,195 dollars; the cost of cutting, loading, &c. was 148,956 dollars; and adding to this 100,000 dollars as profit, we have a total of 507,651 dollars produced by the foreign ice trade in one year. And this is not the only advantage; vessels bound for southern ports, which used formerly to sail in ballast, now carry ice at a small charge; invention, too, has been stimulated to discover the best means of cutting, transport, and stowing.

There are now seven principal ice dealers in Boston. In the year referred to above, 27,000 tons of ice were consumed in that city and its neighbourhood. Three-fourths of the quantity were carried by railway to the depôts at Charleston and East Boston, the remainder

was distributed by private vehicles. The cost by the time it reached the retailers amounted to nearly 55,000 dollars. The retail price varies in proportion to the quantity sold, averaging 13½ cents (7d. sterling) per 100 pounds, which for 27,000 tons gives 72,900 dollars, leaving a profit of over 18,000 dollars to the dealers; and when it is considered that these large sums are realised in the brief hot season, we may better estimate the value of the trade. At Havana, where ice is a monopoly, the price is 6¼ cents per pound; and with this is coupled the instructive fact, that the trade has not advanced since 1832; while at New Orleans, where the price is from ½ to 3 cents per pound, the increase in the same period has been over 25,000 tons. 'At Calcutta,' continues the Report, 'the trade commenced in 1833 with a shipment for that year of 201 tons, and the price has never been above 6 cents per pound, and is now about 2½ cents. The export to that place had increased in 1847 to 3000 tons; but probably less than one-fifth of that quantity is actually sold, owing to the length of the voyage.'

The ice trade affords a notable instance of value created in labour and materials which otherwise would have been lost. To quote the particulars—'The methods and materials for preparing vessels for the transportation of ice have been various. Formerly their holds were ceiled up at the sides, bottom, and top, with boards nailed to joist-ribs secured to the skin of the vessel, and with double bulkheads forward and aft. The spaces thus formed were filled with refuse tan, rice-hulls, meadow-hay, straw, wood-shavings, or like materials. These spaces were made of a thickness proportionate to the length of the voyage, and with reference to the season. The immediate surface of the ice was covered with the same materials, excepting tan. At the present time, sawdust is used almost exclusively for voyages of considerable length. It is placed immediately between the ice and the skin of the vessel. This material is obtained from the state of Maine, and before its use for this purpose, was entirely wasted at the water-mills, and falling into the streams, occasioned serious obstruction.' The cost of sawdust in Boston for this purpose alone amounted in 1847 to 11,500 dollars.

Besides ice-houses on the wharfs at Charleston and East Boston, there are eight others in the interior of the country, capable of containing 141,332 tons of ice. These structures, in almost every instance, are built of wood, with double walls, the spaces between which are filled with wet tan; this freezes in the winter, and as the ice is removed early in the following season, there is but little waste. The passing of locomotives is said to endanger these edifices by fire, and in one instance a brick building has been raised, 'which covers 36,000 feet of land; and the vaults of this ice-house are forty feet in depth, and its walls four feet thick from outside to inside, including two sets of air-spaces.'

Although a natural product, ice of a good marketable quality is only to be obtained by assisting nature. 'At first,' we are informed, 'implements of husbandry were used in securing ice; but as the trade became more important, other machines and different methods were adopted, and abandoned when better were brought forward, or when the increased magnitude of the business required greater facilities. More ice is now secured in one favourable day than would have supplied the whole trade in 1832. Ordinarily, before there has been cold enough to form ice of suitable thickness, snows fall on its surface. If this occurs when the ice is four or more inches in thickness, and the snow not heavy enough to sink the ice, it can be removed by using horses attached to the "snow-scraper;" and under such circumstances this is the method in common use. But if snow falls so heavy as to bring the water above the surface of the ice, it is removed, after it has congealed into snow-ice, with the "ice-plane," which takes off about two inches deep and twenty-two inches wide of its surface. This

machine is drawn by two horses, and is guided by inserting its "guides" into grooves previously made with the "ice-cutter." The chips made by it are scraped off in the same manner as dry snow. These preliminary expenses are often very great; frequently, after much expense has been incurred to remove a body of snow or snow-ice, the weather becomes warm, and spoils the ice on which so much has been expended; and, on the other hand, if it is not done, and the cold continues, there will be little or no increase of thickness to the ice, which is equally a disaster.

When ice has been formed of sufficient thickness, and freed from snow and snow-ice, it is reduced to blocks of uniform size, ordinarily twenty-two inches square, by the ice-cutter. This machine is similar to a carpenter's plough, except that it has a series of cutting chisels, one succeeding another, and deepening the groove. It is drawn by a horse, and cuts at one passage about two inches deep, and if the ice requires to be planed to remove snow-ice, the guides of the "snow-plane" are used in grooves of this depth; but when grooves are required to split from, the ice-cutter should be drawn two or three times through each. These grooves should be parallel to each other, and to make them so, the ice-cutter has a guide, which is placed in the last groove made. When the grooves in one direction have been made, others at right angles with them are produced in the same manner. After this has been done, one groove at the end is opened, and also the two outside grooves; a wedging bar is then stricken into the groove next the end one, and at several places along its length, which detaches it easily from the mass; then the same bar is forced, with a slight blow, into the transverse grooves, which reduces the ice to very uniform square blocks. The blocks of ice thus formed are brought to the receiving-doors of the ice-houses (which are built on the immediate borders of the ponds) either by placing them on sleds, or floating in canals cut through the ice. Various modes of elevating the ice are in use: the endless chain, in combination with the inclined plane, has been successfully used, and also the common pile-driving steam-engine; but at present horse-power is more used than any other. The ice is placed in the houses in regular courses, every block exactly covering the next below it. When a vault has been filled, it is immediately covered with wood shavings, and the receiving-doors fitted up, to prevent waste, until the contents are required for shipment abroad or use at home.

Many of the New England farmers, as is well known, betake themselves to various mechanical employments, such as cabinetmaking, &c. during the winter months; the ice trade will now afford them an additional resource. The daily wages paid for the labour of men and horses during the winter of 1847 was 880 dollars; this is in favourable weather, of which it is reported that not more than twenty days occur in the season. The average daily pay for a horse and man is two dollars.

Such are the results of commercial activity pushing itself into every region, and affording to the denizens of hot countries a grateful and essential resource. Even in our own country, the pure bright ice of New England is a very acceptable refrigerator in the summer months. If means could be contrived for transporting fresh meat in ice at a small cost, Europe would present a ready market for the surplus beef and mutton of America.

THE POOR-LAW IN IRELAND.

At present, an idea is entertained that Irish property is pretty nearly eaten up by rates levied under the new poor-law, and that the ruin of Ireland must shortly be the consequence. As such an opinion is injurious to the true interests of Ireland, and may prevent capitalists from making purchases of property in that part of the United Kingdom, we are happy to observe that the subject has been statistically examined by a writer in the 'Scotsman' newspaper, and the truth, which is at variance with popu-

lar notions, fairly brought out. The following condensed view of this writer's statements invites general consideration:—

'The first order of the Irish Poor-Law Commissioners regarding out-door relief seems to have been issued in August 1847, and the first case of its adoption by a union was in November; but the clerks of unions did not begin to make regular returns till February. The weekly returns given in the reports reach from the week ending February 5 to that ending April 2. We take March, as the last complete month comprised, and as being also, we should think, one of the worst of the year, the poorest of the peasantry having by that time exhausted their harvest store, and out-door labour not being fully resumed. The average number of persons then receiving daily out-door relief in Ireland during last March was 703,762; the average daily number of inmates in the workhouses during the same month, 140,536; total average of paupers, 844,298. This may be taken as the average number of Irish paupers for the year—a year certainly very favourable for the purposes of the alarmists. The Edinburgh Reviewer states the number at 900,000; but the only additional data he has, or at least gives, reduces, instead of increasing the number deducible from the figures of the Commissioners' Report. He has obtained returns of the number of out-door poor up to August; but though there seems to have been an increase in the four months succeeding March, the number had in August again decreased to more than 150,000 below the average of March, being much farther below that average than any of the intervening months were above it; and looking at former experience, we may expect to find the diminution continued through at least August, September, and October, the harvest months. We arrive, therefore, pretty near the fact, that the number of paupers in Ireland under the new system is 840,000, or one in ten of the population, which in 1841 was 8,175,124.

'Coming to the cost, we find that the total expenditure for the six months ending 31st March was L.781,198, or at the rate of L.1,562,396 per annum. Taking, however, the increased expenditure for March and April as data less open to cavil by the alarmists, the total annual amount expended on the Irish poor may be set down at two millions. The valued property of Ireland being about L.16,000,000, it follows that the average annual poor-rate for the whole country is, as near as the data permit us to calculate, 2s. 6d. a pound. At the worst, making all allowances that can be decently asked, it cannot reach 3s. the pound.

'The sum of the whole matter is this—that under the new system, the Irish paupers are 840,000 in number, or 1 in 10 of the population; and the cost of their maintenance L.2,000,000 sterling, or about half-a-crown in the pound on the valued rent. This is a bad enough state of matters; but it is not yet so bad as to justify the cry that the law has demoralised the poor of Ireland, and burdened her property beyond endurance.

'In such a case, comparisons, though perhaps odious, are quite fair; and as English ratepayers would have to supply whatever Irish ratepayers were allowed to refuse, a comparison with England obviously suggests itself. The population of England and Wales is (1841) about 16,000,000; the number of paupers is 1,800,000, or about 1 in 9 of the population. The proportion in Ireland is 1 in 10; so that Ireland has even now a smaller proportion of actual paupers than England. The amount of poor-rates raised in England in 1847 (the latest period for which there are official reports) was L.5,300,000, or about 6s. 8d. per head on the total population; in Ireland, the amount is only 5s. per head. Considering the general character of the Irish population, however, there will be no surprise in finding the proportions greatly alter when we take property instead of population. The value of the property rated to the poor in England and Wales in 1847 was L.67,291,171, on which L.5,300,000 of assessment gives 1s. 7d. the pound, or nearly two-thirds, of the Irish per centage; and since May 1847 (the latest month included in the returns), there has undoubtedly been a considerable increase. But there are also several items to be set off against Ireland, which bring matters to something like an equality. We need not dwell on the large sums paid from the British treasury for purposes of police, &c. defrayed by local rates in England and Scotland, or on such facts as the Irish workhouses having been built by a loan of national money, which is already virtually cancelled; and we need do no more than glance at the enormous exemptions enjoyed by Irish property from national taxes. If parliament laid on Irish property

the same taxes as on English and Scotch, and made England and Scotland pay all the Irish poor-rates in addition to their own, we would profit half a million by the bargain! When not only the Irish, but some writers at home, talk constantly of its being absolutely necessary for the taxpayers of Britain, in some shape, to relieve Irish property of its natural burdens, it is well to remember that Irish property is even now more lightly burdened than British. It is not meant to be argued that the law could not be improved, or that there is no danger of its somewhere, to some extent, and at some time demoralising and overburdening. When we find that the proportion per cent. of paupers is in one province 3, and in another 26, it is easy to conceive that there must be great local pressure, and good reason for a more equal spreading of the burden.

The real grievance, therefore, appears to consist in the inequality of the pressure of the rates; but this is not altogether the fault of the poor-law; it is because certain districts contain a vast number more poor than others. Unfortunately, however, within the excessively pauperised districts there are landlords on whose well-managed properties there are few or no poor; and they necessarily are called on to pay rates for the support of poor called into existence, it may be said, by the neglect of neighbouring proprietors. We should be glad to see Irish landlords generally adopting practical means to remedy this abuse.

RISE FROM A HUMBLE CONDITION.

In a speech delivered by the Hon. and Rev. the Dean of Ripon at a late soiree of the Mechanics' Institution, Leeds, a few passages occur worthy of being widely circulated:—

'I like to think with pleasure, and satisfaction, and wonder, of the extraordinary advancements which, in the providence of God, particular individuals have made, who have just been able to apply the operation of their minds according as they were able to exercise them, and thereby to place themselves in extraordinary positions both in relation to their own prosperity and to the advantage of the country. It may be a very familiar subject, but it is one which I do like to think of, and I will just allude to it. There was a young man who was the youngest of thirteen children, and his father a very poor man; and the best that his father could do for him was to apprentice him to a barber. In that humble and praiseworthy class of public life, that respected individual demeaned himself honourably, as long as he chose to continue in it. He then bestowed his care, and attention, and enterprise upon preparing the beautiful hair of our heads—improving it to that degree that it should be fit to make a wig of. In that he excelled also. Then, gentlemen, he betook himself to the improvement of a weed which I have seen—and which is little more than like a weed—I mean the cotton plant of Carolina. He betook himself to improve the manufacture of cloth made out of that weed. He gained great success, adding merely to the acquirements which he possessed—which you may suppose were very slender—the knowledge which he could pick up by associating with his fellow-men: he gained that success which enabled him to decide the wars of the linen and the cotton, so that a vestment should be made all of cotton. That barber's apprentice, gentlemen, that honourable improver of our hair for the purpose of a wig, was Sir Richard Arkwright, afterwards high sheriff of his county, and who left his family half a million of money. Well, gentlemen, I only put that as one instance of a simple, plain man, honestly following the call of Providence, using the mind according as God's providence gave him the opportunity of drawing forth its resources—throwing himself into the opening which was prepared for him, and thus gaining a prosperity exceeded by no man in this country; and I am sure that language is not equal to say the advantage which our nation has received from his invention, enabling him thus to show the benefit of the exercise of the mind, and talent, and energy, and reflection, and desire for improvement in the humblest station of life. I will mention another case, because I do dwell upon it, I confess, with exceeding interest, from my personal acquaintance with the individual. Gentlemen, it is no more than forty years since, in my travels in America, I came to New York, and I called upon the famous General Moreau, with whom I had the pleasure of being acquainted. He said to me, "Well, here's a strange thing! here's a ship to go by hot water! and to-morrow the trial is to be made, and I am invited to be of the party, and my friends. Will you go with me?" I accompanied General Moreau in the

first steam-vessel that ever sailed upon the Hudson, in America, under the auspices of Mr Fulton, the inventor—a man of a similar cast to Arkwright, perhaps with some greater advantages from his early education, but of a similar tone and cast of mind; unsatisfied with what he had done, and what he could do, and always thinking that he could do something better, and thankful for every information he received, and every opportunity he could gain in making progress in some improvement; so that from a painter in portraits, from a designer in a variety of ways, at last he arrived at the extraordinary eminence and success of making the first practical efficient steam-vessel which could navigate so severe a river as the river Hudson. Now, gentlemen, I remember with pleasure standing upon the deck, with Robert Fulton, and dwelling with him on the subject. I remember asking him, "Do you think it will ever be of any good?" I recollect his countenance lighting up almost with indignation at the idea that any invention of his could fail of being useful. I remember very well, just as we approached the mouth of the Hudson, just as it abuts on the Atlantic Sea, saying—"What will become of us if we drift out to sea? How is it possible that a vessel of this sort can stand the waves of the ocean?" Well, now, gentlemen, when I compare and bring together that day, with the fact of the steamers now crossing the Atlantic in eleven or twelve days, with a regularity and precision which is almost marvellous—why, how is it possible not to see and to be persuaded that there is not a man that lives, and comes within the arena of popular and scientific institutions like this, who has not opportunity given him of being distinguished by giving his talent, industry, and energy to whatever subject in the course of his investigations and inquiries the finger of Providence may point out to him? It is impossible to say, unless we believe that we have arrived at the acme and fulfilment of everything for the good of man—it is impossible not to think that we may be conferring some great blessing upon our own country—that we may, through the means of some individual in the very humblest class, whose mind we may touch, by just giving him a perception and an intuition of some combination connected with science and art—we may render him an instrument of great good to his country and the world, and a source of great happiness and pride to himself.'

CAVERN AT TREBICH.

An interesting discovery has recently been made in the neighbourhood of Trieste, which promises great benefits to that city, where a supply of pure running water has long been a desideratum. The district is composed geologically of sandstone and slate, and what is called *karst*, or white limestone. The latter is very porous, and full of holes of all dimensions, and is in some places a thousand feet thick. The running streams which traverse the sandstone are thus swallowed up as soon as they reach the limestone district near the coast. Various circumstances led to the conclusion that the holes widened below into large caverns which might contain water, and several of them were examined, but without success. 'At length,' to quote from the Journal of the Geological Society, 'an opening of no great width, but sinking perpendicularly into the ground, was discovered at Trebich, about a league north-east from Trieste, which was followed out with great perseverance. The fissure sometimes expanded into a wide cavern, sometimes contracted to a rent of scarce a finger's breadth, and requiring great labour in blowing up the rocks, to enable the workmen to proceed; but it never closed up entirely, and some opening, however small, always remained, keeping up the connection. Sometimes it separated into branches; but by always adhering to the one from which the current of air issued, a very considerable depth was soon attained without any great deviation from the direct course. Once, in a wide part of the opening, all trace of its continuation was lost, and many attempts to recover it, by blowing up the rock, had been made in vain, when the workman, Antony Arich, an intelligent miner from Carinthia, heard during the night a loud roaring and howling, and concluded that the water in the interior, rising suddenly in consequence of heavy rain, was forcing the air through some narrow opening, and thus discovered near the roof of the cave a small fissure, which again led in the right direction. At length, after eleven months' hard labour, Arich reached a very large and extensive grotto, 270 feet high, at

the bottom of which, 1022 feet below the surface of the earth, and 62 feet above the sea-level, a considerable stream of running water was found. This lowest opening is still in the bituminous limestone of the karst, but contains, on a stair-like elevation, a considerable deposit of sand, produced by the destruction of the sandstone and slate, over which the river has run in its course above ground. The water enters the grotto through a low vault; and flowing among the numerous large blocks which have fallen from the roof, expands into a long narrow lake, on which a small raft was formed to explore its further course, and is at length lost under a vault, which, descending below the surface of the water, put a stop to the investigation. During heavy rain, the water has been already seen to rise 240 feet; but to judge from an old float of a mill-wheel found in a higher part of the hole, it must sometimes attain a height of 300 feet above its usual level.

THE SABBATH.

The Sabbath is God's special present to the working-man, and one of its chief objects is to prolong his life, and preserve efficient his working tone. In the vital system it acts like a compensation-pond; it replenishes the spirits, the elasticity and vigour, which the last six days have drained away, and supplies the force which is to fill the six days succeeding; and in the economy of existence, it answers the same purpose as, in the economy of income, is answered by a savings' bank. The frugal man who puts aside a pound to-day, and another pound next month, and who in a quiet way is always putting past his stated pound from time to time, when he grows old and frail, gets not only the same pounds back again, but a good many pounds besides. And the conscientious man, who husbands one day of existence every week—who, instead of allowing the Sabbath to be trampled and torn in the hurry and scramble of life, treasures it devoutly up—the Lord of the Sabbath keeps it for him, and in length of days and a hale old age gives it back with usury. The savings' bank of human existence is the weekly Sabbath.—*North British Review.*

RULES FOR THOSE WHO HAVE A WATCH.

Firstly, Wind your watch as nearly as possible at the same time every day. *Secondly*, Be careful that your key is in good condition, as there is much danger of injuring the machine when the key is worn or cracked; there are more mainsprings and chains broken through a jerk in winding than from any other cause, which injury will, sooner or later, be the result if the key is in bad order. *Thirdly*, As all metals contract by cold, and expand by heat, it must be manifest that to keep the watch as nearly as possible at one temperature is a necessary piece of attention. *Fourthly*, Keep the watch as constantly as possible in one position—that is, if it hangs by day, let it hang by night against something that is soft. *Fifthly*, The hands of a pocket chronometer or duplex watch should never be set backwards; in other watches this is a matter of no consequence. *Sixthly*, The glass should never be opened in watches that set and regulate at the back. One or two directions more it is of vital importance that you bear in mind. On regulating a watch, should it be going fast, move the regulator a trifle towards the slow, and if going slow, do the reverse; you cannot move the regulator too slightly or gently at a time, and the only inconvenience that can arise is, that you may have to perform the duty more than once. On the contrary, if you move the regulator too much at a time, you will be as far, if not farther than ever, from attaining your object; so that you may repeat the movements until quite tired and deeply disappointed, stoutly blaming both watch and watchmaker, while the fault is entirely your own. Again, you cannot be too careful in respect of the nature and condition of your watch-pocket; see that it be made of some material that is soft and pliant, such as wash-leather, which is the best, and also that there be no flue or nap that may be torn off when taking the watch out of the pocket. Cleanliness, too, is as needful here as in the case of the key before winding; for if there be dust or dirt in either instance, it will, you may rely upon it, work its way into the watch, as well as wear away the engine-turning of the case.—*Edward Grafton on Horology.*

SAVING TO GIVE.

Frugality is good, if liberality be joined with it. The first is leaving off superfluous expenses; the last is bestowing them to the benefit of others that need. The first without the last begets covetousness; the last without the first begets prodigality.—*W. Penn.*

THE SPIRIT OF PEACE.

WHERE hath the spirit of peace his home?
Loves he o'er earth or ocean to roam?

He dwells in the deep sequestered glade,
Where the lover's step hath a footpath made;
He lurks in the bowers where birds have sung
To their fluttering mates when the day was young;
By the river pool 'neath the waterfall,
Where the rock-sprung trees have formed a pall,
Solemn and dark, o'er the depth below,
As best befits its majestic flow,
Where hidden wild-flowers scent the air—
Be sure the spirit of peace is there.

By the summer's sea he loves to dwell,
And to note its crisped billows swell;
Or to list the music ocean makes
When his wave the cavern's echo wakes;
Or to mark each ship go proudly by,
Like a sea-king in his panoply;
Or to reckon the snowy skiffs that swim,
Like ocean birds far off and dim,
Where the calm sea blends with the calmer air—
The spirit of peace be sure is there.

In the Highland vale, where the lake lies low,
Encircled by hills of lasting snow;
Where the streams that gladden the valley creep,
Murmuring through channels dark and deep;
Where the red deer stares from the forest forth,
Ere he bounds away to the trackless north;
Where primeval life with eager gaze
Looks out on the stranger who treads its ways;
Where the fond enthusiast loves to roam—
There, there hath the spirit of peace his home.

In the woods at eve when the birds are still,
And naught is heard but the tiny rill,
Which noon and night makes music sweet,
As it leaps its brother rill to meet;
Where naught is seen by the straining eye,
But the trees like spectres standing by—
I have met with the woodman's lowly cot,
Where I thought that the home of man was not;
I have heard his evening praise and prayer,
And I felt that the spirit of peace was there.

When the country lies in Sabbath rest,
And the fields are in golden beauty drest;
When the church-bell's notes o'er the valley come,
Like the voice of a father inviting home;
When the aged man is thoughtful seen,
Where the graves of his early friends lie green
Round the village church in many a heap,
Each with its tenant in slumber deep—
To that humble church in hope repair,
And the spirit of peace shall meet you there.

EAST OF LONDON JEWS.

We are informed that the account of the 'East of London Jews,' in No. 257 of this Journal, is much exaggerated. Our Hebrew correspondent (who now authenticates his communication) may be assured that the error on the part of our contributor was unintentional. As for ourselves, we hardly require to say that we are wholly devoid of prejudices against Jew or Gentile.

CHAMBERS'S EDUCATIONAL COURSE.

Just published, in cloth boards, price 10d.

METEOROLOGY,

BEING ONE OF THE TREATISES IN NATURAL PHILOSOPHY.

* * * In the preparation of the present treatise, the author has endeavoured rather to embody principles, than to occupy space with details of phenomena; his aim being to render Meteorology a subject of scientific study, not a mere record of unexplained facts and elaborate observations.

PROPOSALS FOR A REFORM IN LIGHT LITERATURE.

It seems to be confessed that the great difficulty of the age with respect to light literature is to produce anything new. All the styles and modes of fiction, the Waverley-historic, the Valerio-classic, the Udolpho-romantic, the horrible, the sentimental, the criminal, the silver-fork, the low, the everything, are totally worn out and worthless. We know every kind of character that is to be introduced, and every kind of conjuncture that can ruffle the course of supposititious events, and feel, before we advance twenty pages, that it is all barren. Like *l'homme blasé*, we declare we have seen all that before, and turn away from the proffered meal with disgust, albeit perhaps raging with the sacred hunger of amusement. It has occurred to us that something might be done for mankind in these extraordinary circumstances, and we proceed to lay our scheme before a discerning public.

It may be thought a bold idea, in as far as perfectly new; but the longer we reflect upon it, it appears to us the more plausible that novelists might after all, make something of nature as she is. Many objections might no doubt be ranked up—were it not so, we should not have had novelists neglecting the truth of actual human life so long. In the dearth and exigency of novelty, some one would have pitched upon this idea if it had appeared readily workable. Still, let us calmly consider. The upturn of such a deep virgin soil could not but be attended with a grand vegetation. Surely some of the new plants would prove useful, if not for the conservatory, at least for the kitchen. It would be very strange if something could not be made of them. But let us at once come to particulars.

It is, for instance, a horrid stupidity this constant straining to bring about a marriage between two commonplace young people, with which the curtain may at last be allowed to drop. Suppose we make novels without any silly love affair in them at all, and end the third volume by representing the principal parties as sitting down to dinner instead of preparing to go to church. In actual life, one does not find that marriage is quite looked upon as the *summum bonum*, or that thing for which every other thing is to be sacrificed. We do not find that all the worthy people of our acquaintance are in a ferment of anxiety to get us tied up for life in Hymen's bonds. On the contrary, if we do make up our mind to the venture, we often find these worthy people in some anxiety as to how the affair may turn out. The lady's temper is probably discussed in a dispassionate manner; or our own abilities for housekeeping may be matter of solicitude. At all events, a calm hope may be expressed that we shall have the wisdom to insure upon our life for the benefit of our offspring.

Now, such being the manner of nature, why should we continually keep by the opposite in fiction? Let us try a novel for once without a marriageable heroine, or, say, one who despises marriage as an object to live for. There are women who scorn the idea of being thought under any anxiety for an establishment, and who would prefer eternal spinsterhood to an alliance brought about by manœuvring. Let us see such a person introduced into fiction. She could not fail to tell, from her mere novelty in that situation.

It is, again, a very tiresome thing in novels, as at present written, that every person introduced into them must be described as of a certain fixed character, according to use and wont in this department of literature. For example, if a boarding-school keeper is to be amongst the *dramatis personæ*, then that person must be a paragon of dogmatic pedantry, false pretension, and heartless cruelty. The male boarding-school keeper must be an awful fellow in old-fashioned black attire, with threatening, bushy eyebrows, and that Herculean strength which may enable him to execute his own sentences upon the obverses of the boys; the lady boarding-school keeper a concentration of vinegar, verjuice, and deadly nightshade, with a figure like those which flourish in low valentines, and a breast devoid of the slightest tincture of the milk of human kindness. The pupils of both must regularly detest them as a matter of course. Parents and guardians are the unsuspecting victims of a hollow system, in which there is no more true instruction than there is humanity. I cannot, on any ground, see how the public is to be amused by characters thus formed in a set of old moulds, which never were very good at the first, and have at length become wearisome as an Art-Lottery engraving. I propose telling the truth as a variety which, *ceteris paribus*, must be more entertaining. As to the class of people who keep boarding-schools, every one knows there are many who, so far from being fiends in human shape, are worthy people, performing a duty of great irksomeness and responsibility with zeal and self-denial, often with very inadequate remuneration, and seldom with a return of kind consideration approaching that which they had bestowed on their pupils. Suppose we were to have painted to us, by way of change, a real boarding-school keeper of the male sex, dressed like other people, and rather attentive to, and popular amongst, the boys. Would it not be something at once fresh and refreshing? There might be plenty of innocent whimsicalities about him, to give him a relish—for such will be found the order of nature. Or let us for once have a fine, bouncing, clever, good-looking, and genial woman, in charge of a finishing school. We know such in life—why should they not be in novels? Anyhow, let us at least be done with the stereotyped pedants and viragoes, those dreary monstrosities, which never had an existence,

except in fancy, and whom one sees *coming on* in the advancing pages as you see a bore entering your avenue, or hear him sending his name up stairs.

Certain persons are not only always of certain characters in novels, but they are always represented as in a certain fixed congeries of circumstances. Every young author comes to London with a tragedy in his pocket, and finds the booksellers tipping him the cold shoulder. Now, in the world of fact, many young authors do not venture on a tragedy, and no inconsiderable number get work from publishers as soon as they are fit for it, if not before. In novels, an author is always a shabby-looking person, of excessive volubility, living in a garret. In fact there are many authors who live in handsome houses, and treat their friends to champagne suppers. In novels, they are always getting into wretchedness, because literary merit finds no sort of consideration. In fact we hear occasionally of a successful novelist, whose income for several years has exceeded that of the English prime-minister, or the American president, though somehow he has nevertheless been obliged, by the usual fate of genius, to seek the protection of the court. Would it not be a capital novelty to give us a well-paid, well-dressed author, whom one could scarcely distinguish from a man of high birth and large fortune, even in the particular of his 'difficulties?' Let us have an author who has not written a tragedy. Let us have an author who, in respect of booksellers, is the drainer instead of the drainee. The freshness of such a character in fiction would make any book sell. Or give us his ancient co-relative in the new aspect of an honest man, who scarcely can keep his own amidst the clamours of a set of insatiable *littérateurs*, and we will give three to one on the success of the delineation. As another instance—a governess in fiction is always a held-down woman of excessive modesty and merit—an unhappy creature, solitary amidst society, and never asked to drink wine. There are in the real world governesses who are exceedingly well treated; some who even take a lead in family matters; not a few who are repressed only on account of their insufferable *exigence* and forwardness; and a vast number who are simply women of good sense, solicitous to perform their duty in the first place, and only to think of little matters of personal comfort in the second. Now let us have for once in fiction a sensible, well-used governess. Let us have a real flesh-and-blood governess of this world, and not the faultless monster in a continual worry because she is not danced with. Everybody must feel how delightfully new such a character would be to the world of the circulating library, and what a chance she would have in comparison with her ideal congener.

Dealers in fiction might also revolve the propriety of taking somewhat more truthful views of the merits of various sections of society. Suppose that some one were to treat the world one day to a tale in which rich people and people of rank were to be allowed some small sparing investment of the common virtues of humanity. In actual life they have, as a class, their full share of such merits. It cannot be for nothing that the wearers of good clothes, and the possessors of stock in the funds or elsewhere, are called respectable people. Why should we not, then, have a few characters of the upper class in novels whom one could regard without a mere choice between ridicule and execration? A lord who was not a fool, or a *roué*, or an oppressor of his tenantry, would be a charming novelty in fiction. It might be rash to give full allowance of worth and good sense to the people of the Red Book all at once, for

perhaps here the public mind has got something of a twist; but a spice of decent intellect and good-meaning might be given by way of a first experiment, and perhaps in time it might be possible to represent wealth as not necessarily connected with heartlessness and imbecility. There might be a corresponding procedure with respect to the lower class of characters. We are tired of concentrations of all that is bright and beautiful in persons who might be expected, from their circumstances, to be no better than they should be. Robbers, with wonderful impulses towards angelic excellence, are decidedly palling on the popular taste. Let us have figures from humble life with something like that mixture of good and evil about them which we find in the actual world. Depend upon it it would take.

At the first consideration of this proposed reform, it may be feared that actual nature will prove a tamer and duller thing than the Birmingham nature so long resorted to by the dealers in fiction. Some will be ready to say, 'All very well to speak of truth; but truth is stupid: truth is for science, not for art.' I beg their pardon; but I must entirely dissent from any such view of the matter. I find in real life an endless variety of strange characters and eccentricities, any one of which would make better stuff for the novelists than any of the shams which they have inherited from the tradition of their craft. I have already pointed out how superior certain real sequences of events would be over the hackneyed groupings which the fictionist keeps in stereotype beside him. I feel perfectly clear in saying that I should enjoy in fiction, as I have often done in reality, the spectacle of a boarding-school where there was no stint of bread and butter. What I chiefly plead for, however, is the novelty. It would be like a new world opened up to the pursuit of the naturalist. Even with inferior writing this would tell immensely: with fair talent in the artist, nothing could stand against it. I believe at least that truth might stand out for a good many years, perhaps the whole of our own time. If it then began to fail in its effect, it would be for posterity to devise something as good.

QUETELET ON THE LAWS OF THE SOCIAL SYSTEM.

GREATER attention has perhaps been paid to social questions during the present year than at any recent period. Civil perturbations naturally produce, with other effects, a disposition to devise rules for their governance, or remedies against their recurrence. There will of course be great differences in the character of the remedial measures proposed; still it is always best to look boldly at the evils with which humanity is afflicted, and in this regard honest endeavours to systematise social aberrations, to explain their laws, may find acceptance.

Among the writers who have occupied themselves with this subject, M. Quetelet of Brussels is already favourably known to many readers by his treatise on 'Man,' and the development of his faculties, published about twelve years since. This was followed in 1846 by 'Letters on the Theory of Probabilities applied to Moral and Political Science;' and now, as the complement of these, we have the work whose title is given in the note below.* In the 'Letters,' &c. was originated the law of accidental causes; and this law is shown to be reducible to calculation in common with physical or mechanical laws. Many effects which appear to be accidental, cease to be so when the observations are extended over a large number of facts; and, as the author remarks, 'the liberty of choice (free will), whose results are so capricious when individuals only are observed, leaves no sensible traces of its action when applied to multitudes.' Hence the important law is deduced, 'that

* Du Système Social, et des Lois qui le Régissent. Par A. Quetelet. Paris: Guillaumin et Co. 1848.

social facts, influenced by liberty of choice, proceed with even more regularity than facts submitted simply to the action of physical causes.' Although the tracing out involves certain difficulties, yet analogies are to be found between moral and mechanical laws; and on these various considerations it is urged that 'henceforth moral statistics ought to take its place among the sciences of observation.' It will thus be seen that the aim of the work before us is something beyond mere political economy: it is to develop the laws of equilibrium and movement, and especially the preservative principles existing between different parts of the social system. Man is brought before us in his individual character; in his relations to the nation to which he belongs; and last, the ties which, uniting nations, constitute humanity.

The law of accidental causes is not one of mere hypothesis, it may be proved by physical facts; for instance, the height of the human frame. By aggregating the heights of the population of a country, a mean is obtained which gives the standard, and the departures or variations from this mean range symmetrically above and below it; 'as if,' observes M. Quetelet, 'nature had a type proper to a country, and to the circumstances in which it is placed. Deviations from this type would be the product of causes purely accidental, which act either *plus* or *minus* with the same intensity.'

The groups on either side of the average are the more numerous the more they approach to or resemble the mean; and the more widely they deviate, so do they terminate in rarities, as giants and dwarfs. Every portion of the scale, however, has its value; 'there exists between them a mysterious tie, which so operates that each individual may be considered as the necessary part of a whole, which escapes us physically only to be seized by the eye of science.' The same law applies also to the growth of the body, which would be more regular were nature less interfered with; there is, besides, a standard weight, and a relation between a man's height and the rate of his pulse: taking the mean for males at seventy, we have a datum on which to base other calculations. The author regrets that we have no 'careful continuous observations on workmen whose labour presents a certain periodicity in the exercise of the limbs; on blacksmiths, for example, sawyers, shoemakers, tailors: they might lead to interesting results.' With regard to growth, he continues: 'at the instant of man's entrance into life, his height is fixed by nature; the variations remarked are purely accidental; and when grouped by order of altitudes, they equally obey a law. Such is the harmony with which all has been combined, that the anomalies even exist only in appearance, and they march with the same regularity as the laws whose movement they disguise.' The mean height in Belgium for the male is 1'684 metres, and for the female 1'579 metres.

M. Quetelet suggests, as a means of obtaining valuable and interesting data on many moral and physical questions, that a record should be kept in every family of all the events or circumstances that brought pleasure or grief to the household, that opened a new line of thought, started a new subject of inquiry, as well as periodical entries of the growth in height, weight, &c. of each member of the family. And he gives us an intimation that this course is pursued by Prince Albert, to whom his book is dedicated. With regard to the progressive development of the human being from birth to maturity, the author hopes at some future day to publish his researches, which will doubtless be valuable in an artistic point of view. Complex and difficult as the subject may appear, it is much simplified by the chief result: 'Man's proportions are so fixed, at whatever age we consider him, that the having observed a small number of individuals, is sufficient to give the type in the mean.' There is, besides, really less difference of development than would at first be supposed; uniformity is more prevalent than our appreciation of objects would lead us to conclude. 'In my early investigations,'

pursues M. Quetelet, 'on the proportions of the human body, I measured thirty men of the age of twenty; I distributed them afterwards into three groups of ten men each. In this separation I regarded one condition only—that of having the same mean height for each group, so as to render the other results more easily comparable, without the trouble of reducing by calculation. Thus the mean height was the same for the first, second, and third group; but what was my astonishment to find that the man selected as the mean, representing each one of my three groups, was not only the same in height, but also for each part of the body! The likeness was such, that a single person, measured three times in succession, would have presented more sensible differences in the measures than those which I found between my three means.'

The conclusions to be drawn from these physical phenomena are all intended to bear on the great moral view of the subject. M. Quetelet shows that many of the erroneous opinions to which writers on social questions have come, have originated in their regarding man in the individual rather than in the mass; that which defies calculation in the one case is easily established in the other. Moral are distinguished from physical phenomena by the intervention of man's free choice, and the exercise of this prerogative is found rather to restrict than to disturb the limits of deviation. Marriage is adduced as affording the best example of the direct interference of free choice; generally speaking, it is entered on with great circumspection. Yet, during the past twenty years, the number of marriages in Belgium, regard being had to the increase of population, has remained annually the same. Not only has the number proved constant in the towns and the country, but also as respects marriages between young men and young women, young men and widows, widowers and young women, and widowers and widows. The same fact holds, too, with regard to the ages at which marriage is contracted; and the great discrepancies sometimes observed in ill-assorted unions, are neither to be considered as fatalities nor mere effects of blind passion: like giants and dwarfs in respect of growth, they constitute the remotest deviations in the law of accidental causes. The same result also obtains in other human actions as well as that of marriage; there is a certain regularity in crime, in suicides, in mutilations to avoid military service, in the sum annually staked on the gaming-tables of Paris, and even in the unsealed, undirected, and illegibly-addressed letters deposited yearly in the post-office. 'With such an assemblage of facts before us,' asks the author, 'must man's free choice be denied? Truly I think not. I conceive only that the effect of this free choice is restrained within very narrow limits, and plays among social phenomena the part of an accidental cause. It therefore ensues, that making abstraction of individuals, and considering circumstances only in a general manner, the effects of all accidental causes ought to neutralise and destroy themselves mutually, so as to leave predominant only the true causes in virtue of which society exists and maintains itself. The Supreme Being has wisely imposed limits to our moral faculties as to our physical faculties: man has no power over the eternal laws. The possibility of establishing moral statistics, and deducing useful consequences therefrom, depends entirely on this fundamental fact, that man's free choice disappears, and remains without sensible effect, when the observations extend over a great number of individuals.' In predicating, however, on the number of marriages to take place in any given year, it is important to distinguish between the *apparent* and *real tendency* to the conjugal state. These may exhibit great differences. 'Thus one man may have all his life a real tendency for marriage without ever marrying; while another, from fortuitous circumstances, may marry without experiencing any inclination for wedded life.' It is possible to represent these tendencies by curved lines, which, for males, commencing at the age of 20,

and ending at 80, shows the maximum to be between 35 and 40. For females, the curve terminates ten years earlier, and reaches its highest point in the years from 25 to 30. The distinction between the apparent and real is essential; for although we are able to establish a law for the mass, we can prove nothing beforehand of the individual.

The same real and apparent tendency or inclination exists also with regard to crime, and nearly all other moral actions; for it is clear that a person may have a great inclination for crime without once committing it; another may abhor crime, and yet become culpable. 'It is thus possible,' says M. Quetelet, 'to state, from continued observations, the relative degrees of energy which lead men to execute certain facts. Thus, if I see a million men of 25 or 30 years produce twice as many murders as a million of 40 to 45 years of age, I should be disposed to believe that the inclination to murder among the former has twice the energy of what prevails among the latter. . . . It is important, therefore, to have a number of observations sufficient to eliminate the effects of all the fortuitous causes from which differences may be established between the real and apparent inclination to be determined. . . . So long as the march of justice and that of repression remain the same, which can scarcely be possible, except in one and the same country, constant relations are established between these three facts:—1st, Crimes committed; 2d, Crimes committed and denounced; 3d, Crimes committed, denounced, and brought before the tribunals.' An investigation of criminal tables has shown 'that the law of development of the tendency to crime is the same for France, Belgium, England, and the grand-duchy of Baden, the only countries whose observations are correctly known. The tendency to crime towards the adult age increases with considerable rapidity; it reaches a maximum, and decreases afterwards until the last limits of life. This law appears to be constant, and undergoes no modification but in the extent and period of the maximum. In France, for crimes in general, the maximum appears about the 24th year; in Belgium, it arrives two years later; in England and the grand-duchy of Baden, on the contrary, it is observed earlier. . . . Considering the circumstances,' pursues the writer, 'under this point of view, we shall better form an opinion of the high mission of the legislator, who holds to a certain extent the budget of crimes in his hands, and who can diminish or augment their number by measures combined with more or less of prudence.'

With regard to the theoretical mean, M. Quetelet affirms that 'man, in respect to his moral faculties, as with his physical faculties, is subject to greater or lesser deviations from a mean state; and the oscillations which he undergoes around this mean, follow the general law which regulates all the fluctuations that a series of phenomena can experience under the influence of accidental causes. . . . Free choice, far from opposing any obstacle to the regular production of social phenomena, on the contrary favours them. A people who should be formed only of sages, would annually offer the most constant return of the same facts. This may explain what would at first appear a paradox—namely, that social phenomena, influenced by man's free choice, proceed from year to year with more regularity than phenomena purely influenced by material and fortuitous causes.'

In treating on intellectual qualities, the author observes—'Two things at first are to be distinguished in our intellectual faculties: what we owe to nature, and what we derive from study. These two results are very different; when found united, and carried to a high degree of perfection in the same individual, they produce marvels; when they present themselves isolated, they bring forth nothing but mediocrity. A student of the present day, on leaving school, knows more than Archimedes, but will he make science advance a single step? On the other hand, there exists more than one Archimedes on the surface of the globe,

without a chance of making his genius public, because he lacks the science.' 'If,' we read in another place, 'phrenology should one day realise its promises, we should have the means of directly measuring man's intellectual organisation; we should possess as a consequence the elements by which to solve an extremely complex problem; we should know what each individual owes to nature, and what to science; we should even be able to establish numerically the values of these two portions of his intelligence; but as yet, we are far from perceiving the possibility of such a result. . . . One of the most curious studies that could be proposed in relation to man concerns the progressive development of his different intellectual qualities: it would be a question to recognise those which first manifest themselves, to verify the period when they attain their maximum of energy, and to appreciate the relative degrees of their development at different epochs of life.'

In the chapters on human societies, M. Quetelet traces cycles of duration for nations as for other departments of nature. Thus the Assyrian Empire lasted 1580 years; the Egyptian, 1663 years; the Jewish nation, 1522 years; Greece, 1410 years; the Roman Empire, 1129 years; giving an average of 1461 years, remarkable as corresponding exactly with the *Sothiac* period, or canicular cycle of the Egyptians, with which was comprehended the existence of the phœnix. This result would appear referable to the action of a law, of which, however, too little is known to predicate on events yet to transpire in the future.

The law of accidental causes admits of application to derangements of the mental faculties. 'Moral maladies,' we read, 'are like physical maladies: some of them are contagious, some are epidemic, and others are hereditary. Vice is transmitted in certain families, as scrofula or phthisis. Great part of the crimes which afflict a country originate in certain families, who would require particular surveillance—isolation similar to that imposed on patients supposed to carry about them germs of pestilence.'

The question is examined, Whether the indefinite contraction of the limits between which men can vary is a benefit? 'Absolute equality, if it could be realised, would lead society back to its point of departure, and if it became durable, would plunge it into the most complete atomy: variety and movement would be annihilated; the picturesque would be effaced from the surface of the globe; arts and sciences would cease to be cultivated; that which does most honour to human genius would be abandoned; and as no one would wish to obey another man, great enterprises would become impossible.' To complete the argument, it is shown that the means and the limits vary only in proportion to science.

Besides the points we have noticed, the work under consideration contains many valuable inquiries and suggestions. In the chapter on the intellectual faculties, for example, we find views on literary, artistic, and scientific productions—influence of age upon the development of dramatic talent—excess of labour—on emigration—the influence of the healing art on the social system—demoralisation and pauperism—antagonism of nations; and in the concluding section 'on humanity,' the department of æsthetics presents itself to the discussion: these questions are treated with the author's well-known ability. His work must be taken as a valuable contribution to moral science, to the cause of justice, law, and order. Whatever differences of opinion may be entertained, it is impossible not to be impressed by M. Quetelet's earnestness: he would have nations as wise and trustful as is sometimes the case with individuals. 'The two extreme states,' he observes, 'individuality and humanity, are not the result of human combinations; they are determined by the Supreme Being, who has established laws of dependence between them. Philosophy has busied itself with investigating its nature, and in recognising what each one owes to himself, and the duties which he is bound

to fulfil towards others. . . . It is by such laws that Divine wisdom has equilibrated all in the moral and intellectual world: but what hand will raise the thick veil thrown over the mysteries of our social system, and over the eternal principles which regulate its destinies and assure its preservation? Who will be the other Newton to expound the laws of this other celestial mechanism?

THE WARREN.

SOME years ago I received an invitation from a lady, whom I shall call Mrs Estcourt, to accompany her to the quiet and picturesque bathing-place of W—; an invitation which was doubly pleasing to me, not only because I had a great regard for Mrs Estcourt, but because, within five miles of W—, there resided a family with whom I had formerly passed many happy weeks, and whose long-trying friendship made this prospect of being so near them most delightful. Mrs Estcourt had been a widow about five years; and at the period of which I speak she was little more than thirty. At an early age she had been married to a man considerably her senior, yet her marriage had been a most happy one; and although she was not disconsolate on her husband's death, she truly mourned his loss. Smiles, betokening perfect contentment, at length denoted that the widow's grief was over, when I accompanied her to W—. She was very beautiful in person, and fascinating in manner. Perhaps strangers might think her a little too merry-hearted, considering her position; but I, who well knew her innate goodness and sound sense, thought her clear pleasant laugh the most exhilarating sound in the world. She had already received more than one offer of marriage during her widowhood; nor is this surprising, considering her attractions, not to mention the fact, that her late husband had left her one thousand pounds a year. But Mrs Estcourt turned a deaf ear to the voice of the charmer, charmed he ever so wisely; and in the full enjoyment of her hobby—for she had one, and that a singular one perhaps for a lady—her days flowed peacefully on; and it was partly for the further indulgence of this hobby that she selected W— as the place of sojourn for the summer, it being a favourite resort of the conchologist and mineralogist.

Mrs Estcourt had studied conchology enthusiastically for some years, and she had a very pretty collection of shells. An indefatigable shell-gatherer she proved at W—; and on my mentioning that the son of those old friends, whose residence was within a few miles, was learned in like lore, and had an excellent museum of natural curiosities, she became eager for an introduction, and speedily drove me over to the Warren in her low pony phaeton. After traversing dreary hills and waste tracts of land, while listening to the sullen booming of the ocean, it was cheering to arrive at this low, rambling, but substantial dwelling, inhabited by Mr and Mrs Bovell, and their son Mr Matthew. The traveller had need to arrive at an early hour of the evening, for soon after the curfew bell tolled, all the lights in the mansion were extinguished, and the family retired to rest; while long before daylight in winter, and with sunrise in summer, were the household again astir. This consisted of farm and household domestics; the husband-men strictly fulfilling their appointed duties, according to the most approved rules and regulations of past centuries, no newfangled systems being listened to or tolerated by Mr Bovell; while the maidens assembled round their industrious mistress, with spinning-wheels, or other thrifty employments, each day after the morning bustle and the noon meal was over. At this meal the master, mistress, their son, and all the servants, out-door and in, dined at the same table, the only distinction being, that a lower place was occupied by the subordinates. Nor was this usage ever deviated from or omitted, let who might be the guest. In a capacious hall, with low rafters, and wainscoting black from age,

the table was daily spread for dinner, at an hour when some of us, calling ourselves busy folks too, are sitting down to breakfast. There was a yawning chimney in this old hall, with cosy nooks beside it; and, protected by a folding-screen, Mrs Bovell's own little tea-table stood ensconced here each afternoon. But when any lady visitor came to the Warren, there was a fire lit in the parlour, whose bay window looked on the gay flower garden. In this room, fitted up with snowy dimity, bound with green silken fringe, and decorated with antique engravings, the subjects taken from passages in the Sacred Writings, it was very pleasant to drink tea at three o'clock; when the cream and the butter, the home-made bread, hot and cold, plumcake and conserves, and last, though not least, the finest Hyson, brewed in the quaintest of teapots—filigreed and profusely ornamented was this silver heirloom—rendered that meal, after a long walk or a windy ride, singularly novel and refreshing.

The tea-table was presided over by the kindest and dearest of busy, cheerful, talkative old ladies, in the person of Dame Bovell, attired in brocade and ruffles, high-heeled shoes, and a coiffure with powdered roll surmounting her high forehead. Then in marched Squire Bovell, clad in russet gray of ample cut, with ponderous silver buckles in his shoes, and a well-curled wig on his fine old pate. *He*, indeed, professed to declaim against tea; nevertheless, two or three tiny china cups (for the best blue and gold was always used in the parlour) had to be replenished one after another, as the contents disappeared in his hands; but it was to keep 'Son Matthew' company, said the squire, for Matthew was an inveterate tea-drinker—twelve and fourteen of these fairy bowls full being his 'parlour allowance.'

Mr Matthew Bovell was an only child, and at the time alluded to, a bachelor of forty years of age. He took some part in the farming operations with which the yeoman squire amused himself; for farming was rather an amusement to Squire Bovell than pursued as a mode of gaining his livelihood; for the lands were hereditary, and he was reputed wealthy. But Mr Matthew was not an idle man, even in his leisure hours, of which he had many—they being principally passed in explorations for miles around the adjacent country, bearing in hand a basket and hammer, with which latter implement he demolished innumerable flints, and dug into chalk-beds. In short, he was a geologist, adding to this the study of conchology and antiquarian lore in general; and it was his wont to exhibit, as the pride of his museum, a large flint, hollowed in the centre, which he had found and broken. Mysterious hints he threw out concerning the existence of a toad, whose home, for unimaginable ages, had been within its flinty bosom, until liberated by him. A collector of shells and minerals also was Mr Matthew; through summer heat and winter cold he wended his way over the hills, and across the downs, home by a circuitous route, laden with trophies and natural curiosities.

With a clumsy exterior and heavy countenance he combined a cold sarcastic manner, which did not tend to render him popular with the fair sex; he was, indeed, vilified as a regular woman-hater, though his supreme indifference was perhaps even more unbearable than downright contumely: there were rumours afloat that in early life he had been unworthily treated by a fair but fickle damsel, and hence his antipathy to the whole race of young ladies. He was an affectionate, dutiful son, and beneath a repelling exterior concealed as kindly and generous a heart as ever beat in human bosom; and in the midst of many cynical tirades, a merry word from his beloved mother brought forth a smile which lit up his clouded countenance, and astonished the beholder; for the smile was very sweet, and utterly changed his whole aspect, displaying at the same time a rare set of the whitest ivory teeth: few and far between were these smiles, and none save his mother had hitherto owned the power of conjuring them up. Therefore, when Mrs Estcourt became a

constant visitor at the Warren, and evidently delighted in all its antiquated yet novel customs, and Mr Matthew became her constant companion in explorations and shell-gatherings, 'wonders never will cease,' thought I; but when she actually approached the stern Mr Matthew with badinage, and playfully gave herself pretended airs, commanding him *here*, and ordering him *there*, and the white teeth and the sweet smile were visible in consequence, his mother, who had more than once noted these proceedings, was silent from amazement! She taxed him with having 'rubbish' in his museum, and he bore *that* very well, and asked her to help him in rearranging it; she called him a 'dirty old bachelor,' for not suffering the accumulated cobwebs to be cleared away from its walls and ceiling, and mops and brooms were in requisition by his orders next day; she dined at eleven, and drank tea at three; span with Dame Bovell—it was long ere she was clever at the spinning-wheel—and was a perfect pet and darling of the hearty old squire.

But suddenly there was a change in the pleasant aspect of affairs: Mr Matthew became reserved, and absented himself from the Warren when Mrs Estcourt was there; and when obliged to be in her society, his sarcasm and coldness of demeanour towards her more than once brought tears into her beautiful eyes, though no individual but myself witnessed this betrayal of wounded feeling. I made my own secret comments on the circumstance; and when Mrs Estcourt called Mr Matthew 'a bear,' and exclaimed that 'she hated him,' I had strong doubts that she did not adhere to truth; nor did my doubts rest here, for I also opined that the liking between this pair of opposites was mutual. I knew enough of Matthew Bovell's character to be quite sure that Mrs Estcourt's possession of one thousand a year (a fact which he had only latterly been acquainted with) would entirely preclude his approach in the guise of a suitor, even were such a fact as Mr Matthew 'going a-wooing' within the bounds of credibility. 'For,' said I, 'he considers mercenary motives so unworthy and dishonourable, that sooner than lay himself open to the bare suspicion of being actuated by such, he would sacrifice any hopes, however dear to him.'

'Do you *really* think this is the case?' said Mrs Estcourt musingly; 'and do you *really* think he cares for me in the least?'

It is unnecessary to give my answer here, or the conversation which ensued, ending with much laughing on both sides, and a wager between us of six dozen pair of the finest French kid gloves, depending on the solution of an enigma which we read in different ways. A few days after, we separated, Mrs Estcourt being suddenly called away to attend the sick-bed of a dear and aged relative, and I to take up my temporary abode at the Warren, whither I had been kindly invited. Mr Matthew was more taciturn than ever, more energetic in his geological discoveries, and even Dame Bovell's winsome cheery ways failing to bring the much-wished-for smile: the squire lamented the loss of his merry favourite; and I was waiting for what I considered a good opportunity, in order to test the strength of my cause, on which depended the weighty bet of the French gloves. I had been a guest at the Warren for a week, and I had heard from Lucy Estcourt of her relative's death—one who had been entirely dependent on her bounty for support; when, for the first time since my arrival, Mr Matthew took his place by the chimney-corner at his mother's tea-table, behind the comfortable folding-screen. 'I have had a letter from your ally and friend, Mr Matthew,' said I: 'you do not even ask after her.'

'Pray to whom may you allude?' answered he, redening a little I thought: '*friends* are not so plentiful in this world that we need forget them.'

'I speak of Mrs Estcourt: she used to be such a favourite of yours; and now you appear to forget her entirely.'

'I am sure, my dear, *none* of us forget her,' broke in the worthy dame; 'for she is the kindest, prettiest,

merriest little soul that ever brought sunshine to the old Warren. I only do hope that no needy adventurer will impose on her goodness, and marry her for the sake of her fortune.'

'That is impossible,' returned I; 'as, in the event of her marrying a second time, she loses the whole of her jointure; and whoever takes her to wife receives a penniless bride.'

Mr Matthew was in the act of carrying a cup of tea to his lips as I distinctly pronounced these words: he gave a start; there was a sudden smash; and Dame Bovell exclaimed, 'Goodness a' mercy on me, Son Mat., what is the matter? It is a blessed thing that we are not in the parlour, or one of the blue and gold would have gone instead of this Wedgewood white and red.'

And as the old lady stooped to gather the fragments with my assistance, 'Son Matthew' darted from the hall, saying in a whisper to me as he passed, 'Do walk in the flower garden presently: I wish to speak a few words to you.'

The squire, who had been toiling through a county paper, spectacles on nose, looked up on hearing the commotion, with a loud 'Whew! It is twenty years ago since I saw Mat. so skittish; and that was when fair Emma Norden jilted him. What is in the wind now?'

But although I might have said that it was a gentle southern breeze, bringing sweet hopes, thoughts, and wishes in its train, I held my peace; for explanation was premature, even had I had any to offer: assurance, and my own private convictions, must be made doubly sure ere I ventured to claim my wager from Lucy Estcourt.

Any one who had seen Mr Matthew and myself sauntering round that quiet garden, until the evening dew began to fall, busily conversing, and deeply engrossed with our conversation, might perchance have suspected that *I* was the courted, and *he* the wooer, despite my green spees and rotund proportions. I could scarce help smiling at seeing the cold sarcastic Mr Matthew transformed into a timid, almost despairing lover; for it is said that timidity ever goes hand in hand with true love.

'How dared he presume to think of her, so beautiful and superior a creature in all respects! What had *he* to offer in exchange for *her* priceless hand? He could not even make amends, in a pecuniary point of view, for the fortune she must lose in the event of her marrying again. Besides, *he* was such a stupid, awkward fellow; and yet he loved her—oh! so dearly; and she was so kind and good, did *I* think he might venture to address her? She could but refuse him.'

Very guardedly I hinted, in answer to these disjointed exclamations, that it was just probable he would *not* be rejected; on hearing which, the sedate Mr Matthew seized my hand, and carried it to his lips, appearing transported to the seventh heaven. That night, ere I retired to rest, I wrote the following billet to my friend:—

'DEAR LUCY—As the Smiths are now in Paris, you had better commission them to bring over the six dozen gloves; as I claim my wager, and prefer genuine articles.—Yours, &c.'

The bridegroom-elect was curious to know what our wager was about; but as I thought the knowledge might render him presumptuous, I declined answering any questions; however, the secret was speedily won from Lucy herself, and was no less than this:—Mrs Estcourt had continued to express her conviction that Mr Matthew 'did not care for her: she was too light and frivolous to please him: he evidently disliked and avoided her.' I, on the contrary, insisted that such was not the case; and pointed out to her that it was only since he had learned how wealthy she was in comparison to him that the change observable had arisen. She then gave me full permission to reveal the truth of her situation, which was only known to her intimate friends, laughingly declaring that she would risk the afore-named

wager, and cheerfully pay it a thousand times over, if I succeeded in proving that she was loved for *herself alone*. 'Not that I think for one moment,' added she gravely, 'that Matthew Bovell would value my hand an iota more could it confer *ten thousand* a year on him, instead of *one*; but that I think *with or without money*—he is so superior to me, indeed to all mankind—he would scarcely make choice of one so unworthy as myself for his helpmate.'

When I heard her speak in this way, I became assured that their union must tend to their mutual happiness: nor have I erred in judgment; for they are, and ever have been, the happiest couple in the world!

Many and many times I heard the exclamation, on Mrs Estcourt's approaching second marriage, of 'Well, wonders never cease: but there is no accounting for taste, certainly.' And I must confess that I had sometimes marvelled at her choice. But how sweet were the tears of respect and gratitude which she shed as a tribute to the memory of her first husband—the firm friend who had so earnestly desired to secure her future happiness—when, on her marriage morning, the intelligence was conveyed in due form that she had *not* forfeited her jointure; the proviso having been made solely with the end in view, which she had attained—namely, 'gaining the disinterested love of an honest man!' And when I heard these words read, I almost felt ashamed of myself for having joined with the multitude in their unthinking exclamations.

This gay and pretty creature contentedly established herself at the old Warren, falling into all the out-of-the-world customs and habits of the antiquated owners: geologising with her husband, whose white teeth displayed themselves incessantly; reading news to the squire, who made 'a little fool of her;' Matthew fondly said; and spinning heartily with the dame, whose admiration and love for her daughter exceeded all bounds.

Squire Bovell and his worthy helpmate have long since departed, and newer fashions have usurped the place of the old ones at the Warren; for many young voices ring through the ancient chambers now, and many frolicfeats are performed in the low raftered hall, the folding-screen serving as a charming refuge for 'hide-and-seek.' They are the most beautiful children I ever saw—full of health and joy; and Matthew says 'they are the best-dispositioned and cleverest to be found on earth.'

A new wing has been added to the mansion, so that Lucy has a pleasant drawing-room in addition to the 'lavendered' parlour, though in the former still the 'blue and gold' are used on 'high days and holidays.' There is also an airy suite of nursery apartments, and Matthew seems to like them better than his 'sanctum' itself.

POPULAR MEDICAL ERRORS.

SECOND ARTICLE.

Corns.—That a corn has roots. The common idea, I take it to be, is, that a corn grows from its roots as a tree does, and therefore it is necessary to extirpate the roots before a cure can be accomplished. The advertisements of corn-cutters are often a good deal amusing. I saw one the other day in a Manchester paper, which took a different view from that commonly adopted. The advertiser began by stating that corns had no roots, but he went on (by inadvertence, I suppose) to add that there were no such things as corns, and concluded by a list of charges for removing them. When a part is a good deal exposed to pressure, the cuticle becomes hardened, just as it will at the ends of the fingers in those who play on the violin; besides this, the papillæ of the subjacent true skin become enlarged, and give the appearance of roots when a section of a corn is made. This is all the mystery. So that, let us cut as deep as we will, if we continue to wear tight boots and shoes, the corns will speedily reappear. The kind of shoes which ladies are in the habit of wearing,

which merely cover the toes, and therefore make all the pressure bear on that part, are exceedingly objectionable, especially where the shoes are pointed, and the leather strong.

Hydrophobia.—The notion that hydrophobic patients bite those around them, and thus communicate the disease, is a popular error which I should think scarcely needs contradiction. However, it seems that the idea appeared worthy of contradiction many years ago. In the second volume of a work which Desault published—'Sur la Pierre des Reins, et de la Vessie'—in 1736, he treats of the hydrophobia, and alludes to this notion with the ridicule which it deserves.*

In respect to hydrophobia, there also is, or was, an opinion that patients suffering from the complaint are smothered by the attendants. I should think such an idea could now only exist amongst the unreflecting, not to say ignorant; yet it appears that a practice almost amounting to this was actually recommended and adopted by Van Helmont. 'He kept his patients under water until the psalm "Miserere"' (the 51st, containing nineteen verses) was sung; and in one case a poor girl was drowned.†

Drowning is only like another way of smothering, and this was certainly carrying too far the old adage of desperate remedies for desperate diseases. Whilst on the subject of hydrophobia, I may mention that the prevailing idea of its being peculiar, or even more frequent, in the summer season, is called in question by very high authority. The practice of muzzling dogs during what are called the 'dog-days' is common, I think, in most of our towns; but if we are to credit some of the writers on the subject, it is not more necessary then than at another time. The subject is too purely medical to be entered fully into on the present occasion. I may just state that M. Trollet,‡ who has written an interesting essay on *Rabies*, states that January, which is the coldest, and August, which is the hottest, month in the year, are the very months which furnish him fewest examples of the disease.

Loud Voice a Proof of Strong Lungs.—I have not unfrequently heard the loud cry of an infant considered as a subject of congratulation; 'for at least,' the mother would say, 'the dear thing has sound lungs.' Mothers are always kind and tender to their children, and one would be sorry to say anything calculated to destroy the smallest source of their comfort; but it is not merely in reference to infantile life that the observation is made. I have more than once heard it said by adults that they felt sure their lungs must be sound, on account of the clearness or loudness of their voices. It is true that disease of the lungs may, and does frequently, impair the vocal powers, but it is by no means to be stated in this general manner that a loud voice is indicative of sound lungs.

Spontaneous Combustion.—We often hear people speak of spontaneous combustion in joke, but the question may sometimes arise, Are there, in reality, any cases of this kind? Are we to credit the accounts which are to be met with in books on the subject? There certainly are some very extraordinary instances on record, some of which I may very briefly mention. The singularity about the cases seems to be, that the unfortunate sufferer is said to be consumed literally to ashes, without the furniture about him appearing to be more than just scorched. It is stated in the Transactions of the Copenhagen Society 'that a woman who had been for three years accustomed to take spirituous liquors to excess, and who took little nourishment, sat down one evening to sleep in her chair, and was found consumed in the morning, so that no part of her was found except the skull and the extreme joints of her fingers; all the rest of her body was reduced to ashes.'§ One case is related of a Madame de Boiseon, who was found by her

* Hamilton: Hist. of Med., p. 257, vol. ii.

† Elliotson, p. 726, op. cit.

‡ See Watson, p. 599, vol. i. op. cit.

§ Beck's Medical Jurisprudence, p. 525.

maid on fire one day after she had left her for a few moments. Water was brought and thrown on her, but it only seemed to make the fire rage more and more. Finally, she was burnt to a skeleton in her chair, which, by the by, was only a little scorched. These cases, I think, will suffice; many more might be adduced, but they all seem to be of the same kind. I think it would require very good evidence to make one credit them.

That combustion of the human body can arise *spontaneously*, as the term implies, does not, I think, find many partisans at the present time; but as in most of the cases recorded there seems reason to believe that the patient was placed in circumstances in which he might catch fire from ordinary causes, the question further arises, Can there be a high combustibility of the body? On this point there is not time to enter fully, as so many subjects have to come before us. I may state, however, that many very respectable authorities admit it as possible that the body may be preternaturally combustible, amongst whom I may mention Dr Alfred Taylor of Guy's Hospital.

Milk.—Milk forms a very nutritious and digestible article of food, and on many occasions medical men have to recommend it as the best adapted for the exigencies of the case in point. There is an opinion, however, very common, which I imagine to be in a great measure erroneous, that milk produces phlegm, and is therefore very much to be avoided in all cases of coughs. I will not undertake to say that milk is always proper for invalids; but I must say that I regard this peculiar phlegm-producing quality of milk to be in a great measure a bugbear, which does not deserve a serious consideration. I can conceive it very possible that persons of a plethoric habit, who drink large quantities of malt liquor, may so gorge the lungs with blood, that an increased secretion of mucus (the so-called phlegm) may arise; but I think that such a result is very little likely to have its origin in a milk diet. Still people will affirm that milk does not agree with them, and I would not undertake to say that such is not the case. I only wish to state that the objection which is commonly made to milk in coughs does not seem to me to deserve credit.

Vaccination.—It is a common belief that there is a risk of introducing with the vaccine virus the diseases, or even constitutional tendencies, of the infant from whom the virus is taken. On this account mothers are very particular that the matter be got from a good source, and some will even insist upon seeing the child themselves. If it were really the case that the vaccine virus communicated more than the cow-pox, it might be found a valuable means of communicating vigorous constitutional powers to sickly children, and would even be more valuable in this way than in its application as a preventive of small-pox. I cannot, however, for my part imagine that there is any such effect. At the time when the great Jenner was endeavouring to diffuse his views in respect to the vaccine inoculation, many objections were industriously brought forward, and amongst others, it was said that the diseases of the cow would be thus introduced into the human subject. This was a very parallel kind of reasoning.

Experiments.—People are very ready to suppose that experiments are tried on them by medical men. I have always assured those who express this fear that they give the profession credit for a deal more ingenuity than is possessed by it. I really do not believe the great bulk of medical men, if pressed on the subject, could offer new suggestions in every case, at least such as they dare try. Think how long active and intelligent men have been cudgelling their brains to find out new remedies; and what is there left for us to do? Then, again, if we abandon the legitimate road, we open ourselves to risks which are more likely to mar than make us. Be assured it is very seldom indeed that medical men make use of untried means on their patients, and that there is very little fear of being made the subject of ingenious philosophical experiments.

Disgusting Articles in Medicines.—Many persons, especially amongst the humbler classes, have an idea that articles of a disgusting nature, such as dead men's bones, are used in the composition of medicines. At the present day this is certainly not the case; but it would appear from the older writings that plans of treatment of a very repulsive and disagreeable nature were actually employed. Many of these were happily in the form of outward applications, or used as charms, but have no doubt given origin to the ideas which prevail on this subject. Borlase, in his book of 'Notable Things,' observes that 'a halter wherewith any one has been hanged, if tied about the head, will cure the headache. Moss growing upon a human skull, if dried and powdered, and taken as snuff, is no less efficacious.'* I think, by the by, we might ask, Is it any more efficacious, for it certainly is not more pleasant? Turner—the Dr Samuel Turner who wrote on diseases of the skin, and who seemed rather fond of strange stories—notices a prevalent charm among old women for the shingles: the blood of a black cat, taken from a cat's tail, and smeared on the part affected.† 'The chips of a gallows put round the neck, and worn round the neck, is said to have also cured ague.'‡ Spiders, as may readily be supposed, were in great repute as remedies. Burton, the writer of the 'Anatomy of Melancholy,' was at first dubious as to the efficacy of the spider as a remedy, though he states that he had seen it used by his mother, 'whom he knew to have excellent skill in chirurgery, sore eyes, and aches; till at length,' says he, 'rambling amongst authors, as I often do, I found this very medicine in Dioscorides, approved by Matthiolus, and repeated by Aldrovandus: I began then to have a better opinion of it.'§ For stopping hemorrhages all sorts of disgusting things were used. That very amusing and valuable writer, John Bell, says 'they tied live toads behind the ears, or under the arm-pits, or to the soles of the feet, or held them in the hand till they grew warm. Some imagined,' he continues, 'that they operated by causing fear and horror, but all believed their effects to be very singular; and Michael Mercatus says that this effect of toads is a truth, which any person willing to take the trouble may satisfy himself of by a very simple experiment; for if you hang the toad round a cock's neck for a day or so, you may then cut off his head, and the neck will not bleed a single drop.'|| These particulars are sufficient to show that the old modes of treatment were not the most pleasant that can be conceived. No similar practices are, however, now employed; and the idea that all kinds of disgusting things enter into the composition of medicines is altogether without foundation. We have only, indeed, to consider how much easier and cheaper it is for those engaged in the practice of medicine to supply themselves with roots and salts than dead men's bones, the blood of black cats, and other horrible conceits.

Opening the Chest.—The phrase 'opening the chest' is very common, and exercise is recommended with this view. We have no objection in the world to good exercise, if it be only moderate and regular; but the opening of the chest is fortunately not accomplished by back-boards and dumb-bells. However, the phrase, though vague, is perhaps sufficiently understood, and not particularly coupled with any false practical views. Whilst on this subject, I may be allowed to state that the fashionable gymnastic exercises are, in my opinion, by no means the most desirable kind of exercise. They are, mostly calculated to do harm, and are used at a time of life when great mischief may result from them. Of this mischief I cannot particularise in this place, farther than to state that many important surgical diseases arise from undue straining, and continue to affect the whole of after-life.

Mucous Membranes.—Whilst on the subject of these

* Pettigrew on Medical Superstitions, p. 64.

† Pettigrew, op. cit. 79.

‡ Op. cit. 69.

§ Anatomy of Melancholy, p. 245.

|| Bell's Surgery, vol. i. p. 204.

common expressions, I may just remark that there are some terms used which have really no meaning whatever, and cannot be connected with any definite ideas by those who use them. Sometimes we hear a friend say that 'he is dreadfully ill of the *nerves*;' and another will tell you he is sorry to say that his wife is ill, and the doctors have pronounced it to be the *mucous membranes*. These are of course instances of expressions being used after the manner of Mrs Malaprop, without any inquiry as to their signification.

Seven Years.—People conceive that there is a change every seven years in the constitution. That a change is continually going on there can be no doubt. We know that an infant grows to a full-sized man, and consequently there must be a change of particles—a removal of some, and a fresh deposition of others—else we should have a mere superimposition of parts, and the body of the infant would be contained in that of the adult. But as to the seven years: for my part I never could understand how people satisfied themselves that such changes were completed in exactly seven years. I have often been asked by my patients—'Doctor, do you think I shall ever get rid of this complaint?' They say there is a change every seven years: I look forward for this time, for I have already been ill five.' The Roman Lustrum was, I think, a space of five years, the Greek Olympiad a space of four years, but the seven years is the favourite period chosen as the one which regulates the changes of the body in public opinion. Of course a period like this will bring about many changes, and one cannot but look forward to such a period with feelings of interest and anxiety; still there seems no good reason to select this as the prescribed limits for the operations of nature.

Amputation.—Persons are very curious, and it is very natural they should be, respecting surgical operations. I have often been asked what was the most painful part of an amputation; and before the answer could be well given, the querist has declared his own conviction, that the act of sawing through the bone, or at anyrate cutting through the marrow, must be the critical point. Now this does not appear to be by any means the case; and on thinking upon the subject, it seems to me that the idea arises simply from the word marrow being suggestive of great sensibility, and, as it were, the essence of all that is profound. But the marrow is merely the oily matter contained in the bones, and must in itself be devoid of sensation. In one application of the word it is true; it has reference to an important part, as in the expression 'spinal marrow;' but this use of the word, though sanctioned by medical men, is altogether incorrect, and arose in error. What is called the spinal marrow is not marrow at all, but a part of the nervous system, which is continuous with the brain.

In speaking of surgical operations, I may mention it as a common idea that surgeons were in the habit of adopting means of deadening pain before they undertook an operation. Before, however, the recent employment of ether and chloroform, nothing was used expressly for this purpose. The tourniquet, which is placed round the limb to compress the artery, and prevent loss of blood, was no doubt supposed to be principally to numb pain.

Scurvy.—If we take the trouble to look into a professed work on diseases of the skin, we find a great many diseases described in a great many hard names, and at first feel quite confounded in our attempts to apply these terms properly to the cases we see. However, the public have made a very easy matter of it. With the great mass of people, there is one name which they apply in every instance, and in every instance they apply it wrongly. This is scurvy. 'What a pity (you will hear it said) that Mr A—— is so scorbutic!' 'And really Miss B—— would be very well-looking, if it was not for that scorbutic eruption.' 'What is this eruption?' you ask. 'Oh, that is only a little scurvy, which I have had many years.' 'Pray, doctor, can you give me anything for the scurvy?'

Now, properly, the scurvy is a disease almost confined to sailors, arising from the want of a supply of fresh vegetables. The symptoms of scurvy are entirely different from those which commonly go under this name in a popular sense. There is a soft, spongy, and bleeding state of the gums, and great debility of the body. There is, in reality, no proper eruption on the skin, but irregular blotches, like those produced by a bruise. This disease is not often seen except amongst sailors, and has no relation to the eruptions which we so often see in people's faces.

A VISIT TO THE WESTERN GHATS.

NOT even steam, that link which now so closely connects the dwellers in the far East with the progress and sympathies of their countrymen, has so much conduced to the improvement and comfort of India as the sanitary stations on the different ranges of hills which have of late years been obtained by the English, and which afford the possibility of renovating, in a pure mountain air, the health, strength, and energy that wither under a tropical sun. On the western side of India these 'mountains of refuge' are called the Mahabeshwur Ghats, and are near to, and indeed formerly made part of, the rajahship of Sattarah. During a recent residence in the Bombay presidency, I had the pleasure and benefit of making an excursion thither; and it has occurred to me that a sketch of this pilgrimage to the 'hill country' may not be unwelcome to some of the readers of these pages.

We left Bombay about the end of March, eager to escape the intense heat, already succeeding to the delicious temperature of the winter months; and crossing the harbour in a *bunder-boat*, proceeded up the Negôtnah River to the village of the same name. Servants had preceded us thither with 'provant,' as Captain Dalgetty would have called it; and we took up our abode for the night at the travellers' bungalow, a wretched substitute for the cosy inn or elegant hotel of Europe, being little better than a barn, and very scantily furnished. It was sunset when we arrived; we had therefore little opportunity of seeing the surrounding country and villages, as night in India speedily follows an almost imperceptible twilight. Having little to amuse us in the bungalow, we retired early to rest; a measure the more necessary, as we were to commence our journey next morning at four o'clock, in order to avoid travelling in the heat of the sun.

An hour before daybreak we were summoned to resume our travels. Let not the idea of such an unseasonable hour suggest visions of the chilly discomfort attending on it in our own country. Nothing could be more exquisite than the air and the scene when we issued from the bungalow. The breeze, though comparatively fresh, was balmy, and the purple sky resplendent with stars. Jupiter, the lord of the ascendant, cast a line of light on the river, and hung like a globe of lucid silver from the heavens. The carriages that were to convey us to Mahr belonged to the post-office, and would have been tolerably comfortable vehicles, but for the height of the seats, which must have been intended for people at least six feet high. As there was a basket at the bottom of ours, well covered with palm-leaves, I took the liberty of using it as a stool, till at our first pause to change horses, one of the Parsees—who, by the by, had gained, from his excessive politeness, the sobriquet of Count D'Orsay—approached, and with a profound bow gently insinuated 'that it was not good for the Ma'am Sahib to sit with her feet in the butter!' As I found it was designed for our breakfast, I agreed in

the justice of his remark, and sat with my feet on empty space for the rest of the way. The road we traversed was wild and picturesque, bordered on each side by jungle, and affording in its windings constant glimpses of the blue hills in the distance: occasionally a herd of fairy-footed antelopes would bound across it, or the peacock, uttering a shrill scream, would retreat into his native woods; but no worse denizens of the brushwood made their appearance, being probably scared away by the horn our driver occasionally sounded. At last the Mahr River made its appearance; a broad, tranquil stream, reflecting the deep blue sky; and following its banks for a time, we at last reached the village. Here we breakfasted, dined, and remained, in short, till after sunset. We then drove to the foot of the Ghauts, but being detained longer than we anticipated, it was dark ere we commenced the ascent, which was to be made in palanquins. These were carried by four *hamals*, or bearers, four more running beside them to relieve them of their burden when weary; one, as it was now quite dark, carried a huge torch, on which he from time to time poured oil from a bottle he held in the other hand. The narrow path admitted but one palanquin in a line; we were therefore in a manner separated from each other, and alone with the bearers. The scene was really imposing: the gloom made the precipices on each side look deep and terrible, and such forms as one could distinguish in it took all kinds of fantastic shapes. The torch, smoking and flaring close beside the coffin-like conveyance, brought out in strong relief the sable *hamals'* well-oiled shining skins, and their rolling black eyes and glittering teeth, thus adding a perfect group to the foreground of the picture. Strange sounds, too, rose from the jungle: the hiss of the snakes; the cry of the jackal; the fainter, because more distant roar of other beasts of prey; and every time the bearers gained a height, they paused, and with shrill cries, thanked their monkey god for his aid, and for having given them only a 'light madam' to carry. The moon rose at last, and I could look down on the nests of jungle, and distinguish the clear outline of the hills: solemn and beautiful they looked, casting their awful shade on the home of the tiger and the boar; but I was now quite weary, and becoming too sleepy to observe more, awoke only when my bearers stayed their steps and my palanquin on the mountain summit which was to be our home.

Mahableshwur is situated on the highest point of the western Ghauts, and is a neat town, with a clean open bazaar, to which the money-changers, seated beside their banks (or white cloths), piled with all sorts of coin and currency, from moras to cowries—or small shells—give a picturesque and new feature. The bungalows of the English residents have gardens round them, and are generally very comfortable dwellings. The church is a small and *very* rustic edifice, having the bell hung in a large tree beside it. The society is cheerful, and the drives and rides on the mountain, though few, very attractive, from the scenery and delicious freshness of the air. Our own abode consisted of several scattered bungalows, with tents for the servants and gentlemen, for we were a large party; the drawing and dining-rooms were detached from the building called the Ladies' Bungalow, and we had sometimes to walk through a cloud on our way to dinner; but the house was well furnished, and nicely situated, commanding a fine view. We looked down on the first row of Ghauts, and a more singular scene can scarcely be conceived than the chaos of hill-tops beneath, all of extraordinary forms, and reflecting every shade of light and colour as the sun fell upon them. The mountain opposite our hill had been the scene of a horrid tragedy. In former times, the two mountains had been inhabited

by two rival chiefs, between whom a deadly feud existed. The disputes and fights between these Indian Montagues and Capulets were a continual source of annoyance to their neighbours, and the rajah of Sattarah and the English resident at last resolved on acting as mediators. Their peacemaking efforts were apparently successful; the chiefs consented to an interview; their grievances were to be mutually redressed, and they were to embrace as friends. The dweller on our hill (Bella Vista) was quite in earnest in these friendly demonstrations, but the Purtubghur man had meantime caused a pair of steel claws, exactly resembling those of a tiger, to be made, and fastened them to his hands, which, when closed, concealed them. Whilst in the act of embracing his old enemy, he fixed these terrible weapons in the back of his neck, and literally tore the throat asunder before those present could rush to the rescue. We were rejoiced to learn that ample justice had been taken for this horrible crime. The chief had been driven from his territory, and met the death he deserved.

The Ghauts are very singularly-shaped mountains. They give one the idea of having had a slice cut off their tops, and others are apparently crowned with strong fortresses; indeed, till assured that it was the natural formation of the hill, I thought that Purtubghur had the ruins of a fortification on its summit.

During our stay at Bella Vista, the rajah of Sattarah paid a visit, or rather made a pilgrimage, to a celebrated shrine in the vicinity. He came in state to our bungalow, to visit Lady A—— (the wife of the governor); and the procession was worth seeing, though very different from what one's imagination would have depicted of Eastern state and pomp. First came a party of men, who might well have personated Falstaff's ragged regiment, so poor, patched, and motley was their attire: these worthies shouted aloud, 'Room for the great rajah, the eater of mountains and drinker of rivers!' The ragged heralds were followed by the regular attendants, bearing bundles of peacocks' feathers, the insignia of their master's princely rank; then came two or three horsemen, bearing the round table-like banner; and lastly, the guest so formidably characterised, and who, in fact, looked as if he enjoyed abundantly the good things of this life, even if his diet were not quite of the inconvenient kind described. He bore a strong likeness to the pictures of Henry VIII., and was a courteous middle-aged gentleman, habited in the Eastern costume, and wearing a magnificent emerald ring on his great toe. He was exceedingly gracious, offered us the loan of his elephants, and gave the ladies permission to visit his lately-espoused wife, the Rane.

I was sorry that indisposition prevented me from profiting by this opportunity of visiting a Hindoo zennana; my friends, who did avail themselves of the permission, were much pleased with the lady, who was young, beautiful, and *totally* uneducated, passing all her days in listening to stories, seeing Nautch girls dance, and eating sugar-plums. This is the rajah who was placed by the English on the nominal throne of the Mahrattas, after that deposition of his brothers which has given rise to such dreary debates in the India House and in Parliament. Both brothers are now dead.

In one of our drives we were favoured with the sight of a wild tiger in chase of an antelope. The terrible animal sprang across the road at no great distance from the horses' heads, and disappeared in the jungle. He was hunted, and killed shortly afterwards. A reward of fifty rupees, or five pounds English money, given for the discovery of a tiger, has greatly tended to diminish the number of these animals in the neighbourhood of the English places of abode. We remained six weeks at Mahableshwur, and before our descent to the plains of the Deccan, found it cold enough to wish for a fire. The rains of the monsoon had also commenced, and our journey down the Ghauts, in pouring rain, and by dull cloudy daylight, was rather in prosaic contrast

with our midnight ascent. We had derived great benefit from the pure invigorating air, and even now, in our own cold but happy country, think with pleasure of our abode on the mountains of Mahableshwur.

ART-JOURNAL—THE VERNON GALLERY.

THE late advances in all departments of art in this country are among the most gratifying traits of national improvement; and it is satisfactory to know that cultivated minds are engaged in forming and directing the public taste on matters of such interest. Too long did the æsthetics of art dwell only in the dogmas of connoisseurs, who chattered upon 'Raphael and stuff' with the precision of schoolmen; and it was not till knowledge broke loose from this charmed circle, and diffused itself abroad in the world, that art could be said to be of any practical value. From the early age of George III.'s reign, when all sorts of monstrosities were tolerated, it seems as if the public had advanced centuries in feeling. We cannot look around us without seeing evidences of improved taste. Old things have passed away, and we are in the youth of a new and more vigorous era. Among other wonderful things in this new age, must be mentioned the practice of making munificent gifts to the public. Formerly, every man thought he acquitted himself nobly if he paid his bills and his taxes. All that is quite antiquated now. This is the age of giving. The nation sometimes gives away ten millions in a paroxysm of charitable feeling; and in private life, subscriptions to the extent of hundreds of thousands of pounds are quite a common thing. Anybody who does not 'subscribe' to the extent of a few hundreds a year is thought nothing of. This, like other good things, may no doubt be carried too far; but how much more reasonable is it to give from your abundance while living, than to leave all at your decease to those who will not thank you, and who may probably be damaged by the gift? On this account it will be allowed that Mr Vernon, in lately making a present to the nation of his gallery of pictures—a gift of many thousands of pounds value—did a far handsomer thing than if he had bequeathed the whole to the public at his death. A bequest is the gift of what is no longer of any use to the giver; a present during life is a sacrifice. Here, then, is a man who takes down the whole of his collection of pictures from his walls, and hands them to the National Gallery, where they are merged in the general property of the country. Who, after this, will say that self-sacrificing generosity is not a proud characteristic of the age in which we live?

The notice of Mr Vernon's liberal gift to the nation brings us to the 'Art-Journal,' which has begun to present finely-executed engravings of each picture in the collection, by which means persons in all parts of the country may acquire a proper notion of those beautiful works of art, now the national property. Mr Vernon, we are told, spared no pains or expense in forming his collection. Thirty years was he engaged in the work: frequently he weeded out the least valuable pictures; and the most generous sums were invariably paid for his acquisitions. It is now some years since we walked through his house in Pall Mall; but we retain a lively recollection of the vast number of gems of art which adorned the walls. The whole of his pictures were British, and painted within the last half century; they therefore form a select illustration of the state and progress of the fine arts during that period. The first picture engraved from the Vernon Gallery is one of the beautiful English landscapes of Calcott, and we should say it is worth more than the money charged for the number of the 'Art-Journal' in which it appears. A portrait of Mr Vernon graces the same number.

While there is not a little to please in this periodical, there is likewise something to which we cannot give our admiration. We refer to the articles on the application of refined taste to domestic and other objects. It appears to be the wish of the artist who illustrates these papers

with wood-engravings to introduce greater elegance in form and embellishment into the more common class of manufactures, such as pottery, hardware, and household furniture. As the aim is high, so is the responsibility great, in trying to cultivate new fashions in objects of this kind. It is, therefore, not without regret that we see that forms and ornaments are held up for imitation which, as far as our judgment goes, can only mislead the public taste. What we more particularly object to is the introduction of naked human figures distorted into all sorts of odd postures. We have Sylphs with the tails of mermaids, forming bell-pulls; Cupids holding up candlesticks, sitting on the corners of fenders, and stuck on the ends of pokers. Crouching, kneeling, twining, bending back, standing on tiptoe, reclining, stretching out the arms; in short, in every imaginable posture are these drudging Sylphs and Cupids represented. This profuse use of the human figure seems to us indecorous. Doubtless, for the sake of beauty of form, art has a certain license; the main design being, to delight the eye and elevate the feelings. But the figures we allude to are anything but sightly, and are only the offspring of a capricious fancy. Flowers in various dispositions would be a safer subject of adaptation; yet even in their case care must be taken not to violate ordinary conceptions. Let us add, while on this subject, that elaborate carving, even when in good taste, is objectionable in common household articles, inasmuch as it renders them more difficult to clean. In these, elegance of form should be combined with strict simplicity; for we must not sacrifice utility to show, and fill our rooms with the dirt as well as richness of an old curiosity-shop. It is sufficient, however, that we offer a hint on these points; and we would further suggest to the editor of the work before us the propriety of writing a series of articles defining the license to which artists and manufacturers may properly go in their adaptation of natural objects. By manufacturers of carpets, paper-hangings, works in bronze, and household ornaments of all kinds, precise rules and principles in relation to this department of art are much required.

EXPERIENCES OF A BARRISTER.

THE NORTHERN CIRCUIT.

ABOUT the commencement of the present century there stood, near the centre of a rather extensive hamlet, not many miles distant from a northern seaport town, a large, substantially-built, but somewhat straggling building, known as Craig Farm (popularly *Crook Farm*) House. The farm consisted of about one hundred acres of tolerable arable and meadow land; and at the time I have indicated, belonged to a farmer of the name of Armstrong. He had purchased it about three years previously, at a sale held in pursuance of a decree of the High Court of Chancery, for the purpose of liquidating certain costs incurred in the suit of *Craig versus Craig*, which the said high court had nursed so long and successfully, as to enable the solicitor to the victorious claimant to incarcerate his triumphant client for several years in the Fleet, in 'satisfaction' of the charges of victory remaining due after the proceeds of the sale of Craig Farm had been deducted from the gross total. Farmer Armstrong was married, but childless; his dame, like himself, was a native of Devonshire. They bore the character of a plodding, taciturn, morose-mannered couple: seldom leaving the farm except to attend market, and rarely seen at church or chapel, they naturally enough became objects of suspicion and dislike to the prying, gossiping villagers, to whom mystery or reserve of any kind was of course exceedingly annoying and unpleasant.

Soon after Armstrong was settled in his new pur-

chase, another stranger arrived, and took up his abode in the best apartments of the house. The new-comer, a man of about fifty years of age, and evidently, from his dress and gait, a seafaring person, was as reserved and unsocial as his landlord. His name, or at least that which he chose to be known by, was Wilson. He had one child, a daughter, about thirteen years of age, whom he placed at a boarding-school in the adjacent town. He seldom saw her; the intercourse between the father and daughter being principally carried on through Mary Strugnell, a widow of about thirty years of age, and a native of the place. She was engaged as a servant to Mr Wilson, and seldom left Craig Farm except on Sunday afternoons, when, if the weather was at all favourable, she paid a visit to an aunt living in the town; there saw Miss Wilson; and returned home usually at half-past ten o'clock—later rather than earlier. Armstrong was occasionally absent from his home for several days together, on business, it was rumoured, for Wilson; and on the Sunday in the first week of January 1802, both he and his wife had been away for upwards of a week, and were not yet returned.

About a quarter past ten o'clock on that evening the early-retiring inhabitants of the hamlet were roused from their slumbers by a loud, continuous knocking at the front door of Armstrong's house: louder and louder, more and more vehement and impatient, resounded the blows upon the stillness of the night, till the soundest sleepers were awakened. Windows were hastily thrown open, and presently numerous footsteps approached the scene of growing hubbub. The unwonted noise was caused, it was found, by Farmer Armstrong, who, accompanied by his wife, was thundering vehemently upon the door with a heavy black-thorn stick. Still no answer was obtained. Mrs Strugnell, it was supposed, had not returned from town; but where was Mr Wilson, who was almost always at home both day and night? Presently a lad called out that a white sheet or cloth of some sort was hanging out of one of the back windows. This announcement, confirming the vague apprehensions which had begun to germinate in the wise heads of the villagers, disposed them to adopt a more effectual mode of obtaining admission than knocking seemed likely to prove. Johnson, the constable of the parish, a man of great shrewdness, at once proposed to break in the door. Armstrong, who, as well as his wife, was deadly pale, and trembling violently, either with cold or agitation, hesitatingly consented, and crowbars being speedily procured, an entrance was forced, and in rushed a score of excited men. Armstrong's wife, it was afterwards remembered, caught hold of her husband's arm in a hurried, frightened manner, whispered hastily in his ear, and then both followed into the house.

'Now, farmer,' cried Johnson, as soon as he had procured a light, 'lead the way up stairs.'

Armstrong, who appeared to have somewhat recovered from his panic, darted at once up the staircase, followed by the whole body of rustics. On reaching the landing-place, he knocked at Mr Wilson's bedroom door. No answer was returned. Armstrong seemed to hesitate, but the constable at once lifted the latch; they entered, and then a melancholy spectacle presented itself.

Wilson, completely dressed, lay extended on the floor a lifeless corpse. He had been stabbed in two places in the breast with some sharp-pointed instrument. Life was quite extinct. The window was open. On farther inspection, several bundles containing many of Wilson's valuables in jewellery and plate, together with clothes, shirts, silk handkerchiefs, were found. The wardrobe and a secretary-bureau had been forced open. The assassins had, it seemed, been disturbed, and had

hurried off by the window without their plunder. A hat was also picked up in the room, a shiny, black hat, much too small for the deceased. The constable snatched it up, and attempted to clap it on Armstrong's head, but it was not nearly large enough. This, together with the bundles, dissipated a suspicion which had been growing in Johnson's mind, and he roughly exclaimed, 'You need not look so scared, farmer; it's not you: that's quite clear.'

To this remark neither Armstrong nor his wife answered a syllable, but continued to gaze at the corpse, the bundles, and the broken locks, in bewildered terror and astonishment. Presently some one asked if anybody had seen Mrs Strugnell?

The question roused Armstrong, and he said, 'She is not come home: her door is locked.'

'How do you know that?' cried the constable, turning sharply round, and looking keenly in his face. 'How do you know that?'

'Because—because,' stammered Armstrong, 'because she always locks it when she goes out.'

'Which is her room?'

'The next to this.'

They hastened out, and found the next door was fast.

'Are you there, Mrs Strugnell?' shouted Johnson.

There was no reply.

'She is never home till half-past ten o'clock on Sunday evenings,' remarked Armstrong in a calmer voice.

'The key is in the lock on the inside,' cried a young man who had been striving to peep through the key-hole.

Armstrong, it was afterwards sworn, started as if he had been shot; and his wife again clutched his arm with the same nervous, frenzied gripe as before.

'Mrs Strugnell, are you there?' once more shouted the constable. He was answered by a low moan. In an instant the frail door was burst in, and Mrs Strugnell was soon pulled out, apparently more dead than alive, from underneath the bedstead, where she, in speechless consternation, lay partially concealed. Placing her in a chair, they soon succeeded—much more easily, indeed, than they anticipated—in restoring her to consciousness. Nervously she glanced round the circle of eager faces that environed her, till her eyes fell upon Armstrong and his wife, when she gave a loud shriek, and muttering, 'They, they are the murderers,' swooned, or appeared to do so, again instantly.

The accused persons, in spite of their frenzied protestations of innocence, were instantly seized and taken off to a place of security; Mrs Strugnell was conveyed to a neighbour's close by; the house was carefully secured; and the agitated and wondering villagers departed to their several homes, but not, I fancy, to sleep any more for that night.

The deposition made by Mrs Strugnell at the inquest on the body was in substance as follows:—

'On the afternoon in question she had, in accordance with her usual custom, proceeded to town. She called on her aunt, took tea with her, and afterwards went to the Independent Chapel. After service, she called to see Miss Wilson, but was informed that, in consequence of a severe cold, the young lady was gone to bed. She then immediately proceeded homewards, and consequently arrived at Craig Farm more than an hour before her usual time. She let herself in with her latch key, and proceeded to her bedroom. There was no light in Mr Wilson's chamber, but she could hear him moving about in it. She was just about to go down stairs, having put away her Sunday bonnet and shawl, when she heard a noise, as of persons entering by the back way, and walking gently across the kitchen floor. Alarmed as to who it could be, Mr and Mrs Armstrong not being expected home for several days, she gently closed her door, and locked it. A few minutes after, she heard stealthy steps ascending the creaking stairs, and presently her door was tried, and a voice in a low hurried whisper said, "Mary, are you there?" She was positive it was Mr Armstrong's voice, but was too

terrified to answer. Then Mrs Armstrong—she was sure it was she—said also in a whisper, and as if addressing her husband, “She is never back at this hour.” A minute or so after there was a tap at Mr Wilson’s door. She could not catch what answer was made; but by Armstrong’s reply, she gathered that Mr Wilson had lain down, and did not wish to be disturbed. He was often in the habit of lying down with his clothes on. Armstrong said, “I will not disturb you, sir; I’ll only just put this parcel on the table.” There is no lock to Mr Wilson’s door. Armstrong stepped into the room, and almost immediately she heard a sound as of a violent blow, followed by a deep groan, and then all was still. She was paralysed with horror and affright. After the lapse of a few seconds, a voice—Mrs Armstrong’s undoubtedly—asked in a tremulous tone if “all was over?” Her husband answered “Yes: but where be the keys of the writing-desk kept?” “In the little table-drawer,” was the reply. Armstrong then came out of the bedroom, and both went into Mr Wilson’s sitting apartment. They soon returned, and crept stealthily along the passage to their own bedroom on the same floor. They then went down stairs to the kitchen. One of them—the woman, she had no doubt—went out the backway, and heavy footsteps again ascended the stairs. Almost dead with fright, she then crawled under the bedstead, and remembered no more till she found herself surrounded by the villagers.’

In confirmation of this statement, a large clasp-knife belonging to Armstrong, and with which it was evident the murder had been perpetrated, was found in one corner of Wilson’s bedroom; and a mortgage deed, for one thousand pounds on Craig Farm, the property of Wilson, and which Strugnell swore was always kept in the writing-desk in the front room, was discovered in a chest in the prisoners’ sleeping apartment, together with nearly one hundred and fifty pounds in gold, silver, and county bank-notes, although it was known that Armstrong had but a fortnight before declined a very advantageous offer of some cows he was desirous of purchasing, under the plea of being short of cash. Worse perhaps than all, a key of the back-door was found in his pocket, which not only confirmed Strugnell’s evidence, but clearly demonstrated that the knocking at the door for admittance, which had roused and alarmed the hamlet, was a pure subterfuge. The conclusion, therefore, almost universally arrived at throughout the neighbourhood was, that Armstrong and his wife were the guilty parties; and that the bundles, the broken locks, the sheet hanging out of the window, the shiny, black hat, were, like the knocking, mere cunning devices to mislead inquiry.

The case excited great interest in the county, and I esteemed myself professionally fortunate in being selected to hold the brief for the prosecution. I had satisfied myself, by a perusal of the depositions, that there was no doubt of the prisoners’ guilt, and I determined that no effort on my part should be spared to insure the accomplishment of the ends of justice. I drew the indictment myself; and in my opening address to the jury, dwelt with all the force and eloquence of which I was master upon the heinous nature of the crime, and the conclusiveness of the evidence by which it had been brought home to the prisoners. I may here, by way of parenthesis, mention that I resorted to a plan in my address to the jury which I have seldom known to fail. It consisted in fixing my eyes and addressing my language to each juror one after the other. In this way each considers the address to be an appeal to his individual intelligence, and responds to it by falling into the views of the barrister. On this occasion the jury easily fell into the trap. I could see that I had got them into the humour of putting confidence in the evidence I had to produce.

The trial proceeded. The cause of the death was scientifically stated by two medical men. Next followed the evidence as to the finding of the knife in the bedroom of the deceased; the discovery of the mortgage

deed, and the large sum of money, in the prisoners’ sleeping apartment; the finding the key of the back-door in the male prisoner’s pocket; and his demeanour and expressions on the night of the perpetration of the crime. In his cross-examination of the constable, several facts perfectly new to me were elicited by the very able counsel for the prisoners. Their attorney had judiciously maintained the strictest secrecy as to the nature of the defence, so that it now took me completely by surprise. The constable, in reply to questions by counsel, stated that the pockets of the deceased were empty; that not only his purse, but a gold watch, chain, and seals, which he usually wore, had vanished, and no trace of them had as yet been discovered. Many other things were also missing. A young man of the name of Pearce, apparently a sailor, had been seen in the village once or twice in the company of Mary Strugnell; but he did not notice what sort of hat he generally wore; he had not seen Pearce since the night the crime was committed; had not sought for him.

Mary Strugnell was the next witness. She repeated her previous evidence with precision and apparent sincerity, and then I abandoned her with a mixed feeling of anxiety and curiosity to the counsel for the defence. A subtle and able cross-examination of more than two hours’ duration followed; and at its conclusion, I felt that the case for the prosecution was so damaged, that a verdict of condemnation was, or ought to be, out of the question. The salient points dwelt upon, and varied in every possible way, in this long sifting, were these:—

‘What was the reason she did not return in the evening in question to her aunt’s to supper as usual?’
‘She did not know, except that she wished to get home.’

‘Did she keep company with a man of the name of Pearce?’

‘She had walked out with him once or twice.’

‘When was the last time?’

‘She did not remember.’

‘Did Pearce walk with her home on the night of the murder?’

‘No.’

‘Not part of the way?’

‘Yes; part of the way.’

‘Did Pearce sometimes wear a black, shiny hat?’

‘No—yes: she did not remember.’

‘Where was Pearce now?’

‘She didn’t know.’

‘Had he disappeared since that Sunday evening?’

‘She didn’t know.’

‘Had she seen him since?’

‘No.’

‘Had Mr Wilson ever threatened to discharge her for insolence to Mrs Armstrong?’

‘Yes; but she knew he was not in earnest.’

‘Was not the clasp-knife that had been found always left in the kitchen for culinary purposes?’

‘No—not always; generally—but not *this* time that Armstrong went away, she was sure.’

‘Mary Strugnell, you be a false-sworn woman before God and man!’ interrupted the male prisoner with great violence of manner.

The outbreak of the prisoner was checked and rebuked by the judge, and the cross-examination soon afterwards closed. Had the counsel been allowed to follow up his advantage by an address to the jury, he would, I doubt not, spite of their prejudices against the prisoners, have obtained an acquittal; but as it was, after a neutral sort of charge from the judge, by no means the ablest that then adorned the bench, the jurors, having deliberated for something more than half an hour, returned into court with a verdict of ‘guilty’ against both prisoners, accompanying it, however, with a strong recommendation to mercy!

‘Mercy!’ said the judge. ‘What for? On what ground?’

The jurors stared at each other and at the judge:

they had no reason to give! The fact was, their conviction of the prisoners' guilt had been very much shaken by the cross-examination of the chief witness for the prosecution, and this recommendation was a compromise which conscience made with doubt. I have known many such instances.

The usual ridiculous formality of asking the wretched convicts what they had to urge why sentence should not be passed upon them was gone through; the judge, with unmoved feelings, put on the fatal cap; and then a new and startling light burst upon the mysterious, bewildering affair.

'Stop, my lord!' exclaimed Armstrong with rough vehemence. 'Hear me speak! I'll tell ye all about it; I will indeed, my lord. Quiet, Martha, I tell ye. It's I, my lord, that's guilty, not the woman. God bless ye, my lord; not the wife! Doant hurt the wife, and I'll tell ye all about it. I *alone* am guilty; not, the Lord be praised, of murder, but of robbery!'

'John!—John!' sobbed the wife, clinging passionately to her husband, 'let us die together!'

'Quiet, Martha, I tell ye! Yes, my lord, I'll tell ye all about it. I was gone away, wife and I, for more nor a week, to receive money for Mr Wilson, on account of smuggled goods—that money, my lord, as was found in the chest. When we came home on that dreadful Sunday night, my lord, we went in back way; and hearing a noise, I went up stairs, and found poor Wilson stoned-dead on the floor. I were dreadful skeared, and let drop the candle. I called to wife, and told her of it. She screamed out, and amaist fainted away. And then, my lord, all at once the devil shot it into my head to keep the money I had brought; and knowing as the keys of the desk where the mortgage writing was kept was in the bedroom, I crept back, as that false-hearted woman said, got the keys, and took the deed; and then I persuaded wife, who had been trembling in the kitchen all the while, that we had better go out quiet again, as there was nobody in the house but us: I had tried that woman's door—and we might perhaps be taken for the murderers. And so we did; and that's the downright, honest truth, my lord. I'm rightly served; but God bless you, doant hurt the woman—my wife, my lord, these thirty years. Five-and-twenty years ago come May, which I shall never see, we buried our two children. Had they lived, I might have been a better man; but the place they left empty was soon filled up by love of cursed lucre, and that has brought me here. I deserve it; but oh, mercy, my lord! mercy, good gentlemen!—turning from the stony features of the judge to the jury, as if they could help him—not for me, but the wife. She be as innocent of this as a new-born babe. It's I! I! scoundrel that I be, that has brought thee, Martha, to this shameful pass!' The rugged man snatched his life-companion to his breast with passionate emotion, and tears of remorse and agony streamed down his rough cheeks.

I was deeply affected, and felt that the man had uttered the whole truth. It was evidently one of those cases in which a person liable to suspicion damages his own cause by resorting to a trick. No doubt, by his act of theft, Armstrong had been driven to an expedient which would not have been adopted by a person perfectly innocent. And thus, from one thing to another, the charge of murder had been fixed upon him and his hapless wife. When his confession had been uttered, I felt a species of self-accusation in having contributed to his destruction, and gladly would I have undone the whole day's proceedings. The judge, on the contrary, was quite undisturbed. Viewing the harangue of Armstrong as a mere tissue of falsehood, he coolly pronounced sentence of death on the prisoners. They were to be hanged on Monday. This was Friday.

'A bad job!' whispered the counsel for the defence as he passed me. 'That witness of yours, the woman Strugnell, is the real culprit.'

I tasted no dinner that day: I was sick at heart; for I felt as if the blood of two fellow-creatures was on my

hands. In the evening I sallied forth to the judge's lodgings. He listened to all I had to say; but was quite imperturbable. The obstinate old man was satisfied that the sentence was as it should be. I returned to my inn in a fever of despair. Without the approval of the judge, I knew that an application to the secretary of state was futile. There was not even time to send to London, unless the judge had granted a respite.

All Saturday and Sunday I was in misery. I denounced capital punishment as a gross iniquity—a national sin and disgrace; my feelings of course being influenced somewhat by a recollection of that unhappy affair of Harvey, noticed in my previous paper. I half resolved to give up the bar, and rather go and sweep the streets for a livelihood, than run the risk of getting poor people hanged who did not deserve it.

On the Monday morning I was pacing up and down my breakfast-room in the next assize town, in a state of great excitement, when a chaise-and-four drove rapidly up to the hotel, and out tumbled Johnson the constable. His tale was soon told. On the previous evening, the landlady of the Black Swan, a road-side public-house about four miles distant from the scene of the murder, reading the name of Pearce in the report of the trial in the Sunday county paper, sent for Johnson to state that that person had on the fatal evening called and left a portmanteau in her charge, promising to call for it in an hour, but had never been there since. On opening the portmanteau, Wilson's watch, chains, and seals, and other property, were discovered in it; and Johnson had, as soon as it was possible, set off in search of me. Instantly, for there was not a moment to spare, I, in company with Armstrong's counsel, sought the judge, and with some difficulty obtained from him a formal order to the sheriff to suspend the execution till further orders. Off I and the constable started, and happily arrived in time to stay the execution, and deprive the already-assembled mob of the brutal exhibition they so anxiously awaited. On inquiring for Mary Strugnell, we found that she had absconded on the evening of the trial. All search for her proved vain.

Five months had passed away; the fate of Armstrong and his wife was still undecided, when a message was brought to my chambers in the Temple from a woman said to be dying in St Bartholomew's Hospital. It was Mary Strugnell; who, when in a state of intoxication, had fallen down in front of a carriage, as she was crossing near Holborn Hill, and had both her legs broken. She was dying miserably, and had sent for me to make a full confession relative to Wilson's murder. Armstrong's account was perfectly correct. The deed was committed by Pearce, and they were packing up their plunder when they were startled by the unexpected return of the Armstrongs. Pearce, snatching up a bundle and a portmanteau, escaped by the window; she had not nerve enough to attempt it, and crawled back to her bedroom, where she, watching the doings of the farmer through the chinks of the partition which separated her room from the passage, concocted the story which convicted the prisoners. Pearce thinking himself pursued, too heavily encumbered for rapid flight, left the portmanteau as described, intending to call for it in the morning, if his fears proved groundless. He, however, had not courage to risk calling again, and made the best of his way to London. He was now in Newgate under sentence of death for a burglary, accompanied by personal violence to the inmates of the dwelling he and his gang had entered and robbed. I took care to have the deposition of the dying wretch put into proper form; and the result was, after a great deal of petitioning and worrying of authorities, a full pardon for both Armstrong and his wife. They sold Craig Farm, and removed to some other part of the country, where, I never troubled myself to inquire. Deeply grateful was I to be able at last to wash my hands of an affair which had cost me so much anxiety and vexation; albeit the lesson it afforded me of not coming hastily to

conclusions, even when the truth seems, as it were, upon the surface of the matter, has not been, I trust, without its uses.

THE ENCHANTED BAY.

[THE following adventure of a boat's crew, in their voyage from Possession Island, a small guano station near the coast of South Africa, to Walwich Bay on the mainland, is extracted from the 'Cape Town Mirror,' a very meritorious miscellany recently commenced]:—

The breeze was very light, and it was midnight before we heard the breakers on Pelican Point, a long spit of sand, forming the western side of Walwich Bay. It was then blowing fresh, with very thick weather, and we stood off till morning. At daylight on the 12th we stood in again for Pelican Point; as the wind now blew from the south-east, which was directly off the bay, we found it would be necessary to work in. I therefore filled the ballast-casks, to give the boat a better hold on the water, and kept three hands baling, as she then leaked very badly. In this way we got in before evening, near enough to see, close to the beach, on the east side of the bay, opposite Pelican Point, a small storehouse, built of planks, with a large triangle or 'shears' near it, such as are used to fasten cattle to for slaughtering.

The wind, however, continued adverse, and we were unable to effect a landing before sunset, and were thus obliged to stand out to sea again. As the evening advanced, the wind drew round to the south-west, and was thus driving us gradually over towards the land north of the bay, near the mouth of the Swakop River. Not being able to wear the boat, for fear of her filling, we were obliged to 'club-haul' her, by throwing overboard, on the weather-bow, a sail lashed to an oar, and this made fast by a line passing round to the lee-bow of the boat. The sail and oar floated on the surface, and not being so high out of water as the boat, were not carried forward so fast by the force of the wind. Thus the line, pulling at the lee-bow, gradually drew the boat's head round to the south-east, and she then drifted along parallel with the land. I have given this explanation not for the benefit of seamen, who of course do not need it, but for those readers who may never happen to have seen a boat put about in this fashion.

My companions were now ready to give up altogether, believing that we should never reach the land. They were quite worn out, and for a time refused to lend a hand in working the boat, declaring that it was useless, and that our case was desperate. At length, after much reasoning and persuasion, I induced them to aid in making one more trial.

By good fortune, shortly after midnight, the wind, for the first time since we left the ship, came out from the northward, and enabled us to stand in, as we thought, directly for the bay. What was our surprise and alarm, then, to find, when the sun rose over the eastern mountains, that we were approaching a part of the coast of which we had not the slightest recollection! On our starboard-bow, where we expected to see Pelican Point, was a low sandy island, that we had no knowledge of whatever. Other islands lay right ahead between us and the mountains. The hut and the shears were nowhere to be seen. We could not tell what to make of it. I began to be afraid that we had been carried by a current to a place laid down on the chart as Sandwich Harbour, about thirty miles south of Walwich Bay, though how we could have come so far in so short a time I could not imagine.

We continued to stand on, in great wonder and perplexity, till Frederick Noon suddenly exclaimed, 'See! there is a woman in a white shawl on that island.' We looked, and certainly saw something that had very much the appearance he described. But while we were doubting and speculating upon it, the supposed woman suddenly unfolded her wings and flew off, in the shape of a pelican with brown wings and a white neck and head. We had a hearty laugh at Fred's mistake, but were at the same time puzzled to think how it was that we had not discovered the deception till the bird flew away, as the distance did not seem great enough to give rise to such an error.

At length, as we kept drawing in to the land, some one cried out—'There is a village, and the people about it.' And sure enough there they were, right before us, and, as it seemed, not half a mile distant. There was a row of round-topped huts above the beach; and the people,

in clothing of various colours, were standing before them, apparently engaged in watching our motions. The little naked brown children could also be distinguished running about at the edge of the water. The people seemed to be numerous, and we were at first uncertain how to act. At length, after a brief consideration, I determined to take the risk of landing alone. Putting off a part of my clothes, in order to swim ashore, and giving my watch and some other small articles which I had about me to Frederick to keep, I directed my companions, in case they saw any harm befall me, to bear away immediately for an anchorage laid down on the coast to the northward, where it was possible that they might find a trading vessel, or at least obtain some provisions on shore.

I then jumped into the water. The splash which I made produced a miraculous effect: the whole crowd of people on shore, great and small, gray, red, and brown, instantly soared up into the air, and flew away in a cloud of pelicans, flamingoes, sand-pipers, and other birds. This put the climax to our perplexity. We were too much astonished to be amused at our strange blunder. Bearing up again for the shore, we presently arrived at the beach, and landed. On going up to the supposed village, it proved to be the skeleton of an enormous whale, whose arching ribs had taken the appearance of a row of native huts. Still it seemed very singular that we should have been so completely deceived at so short a distance.

On looking about us, we found that not only was the land we stood on an island, but we were surrounded by numberless low sandy islets, between which the sea was running in and out in the strangest manner. My companions now became greatly alarmed, declaring that we should all perish if we remained there, and insisting that we should quit this desolate and unknown region, and look for Walwich Bay. To quiet them, and to clear up the uncertainty of our situation, I resolved, as it was now nearly noon, to get an observation, and determine our real situation. Accordingly, we went back to the boat, and stood out from the land, in order to obtain a clear horizon. On taking the altitude of the sun, and making the calculation, I found that we were in the precise latitude of Walwich Bay. The others thought that I was deceiving them; but feeling positive I was right, I resolved to stand in for the shore again, in hopes that the mystery would be cleared up.

And now a wonderful change was apparent. The sun, having passed the meridian, was now shining with a western declination. A smart breeze, moreover, had arisen and swept away the haze that hung over the land. With it, and with the change in the position of the sun, the *mirage*, which had been the cause of all our perplexities, had disappeared. Everything was now familiar to us as we had seen it on the previous afternoon. There was Pelican Point, with the skeleton of the whale, and the hundreds of birds about it, no longer magnified by the deceptive haze, but in their natural proportions. The straits which had converted it into an island were now changed to dry land, as was also the seeming sea which had flowed about the sand-hills on shore, and turned them into so many islets. On the opposite side of the bay, the store and the triangle, which had been concealed by the mist, were plainly visible. The source of all our mistakes was now apparent; at the same time, I am inclined to think that any other persons, coming in as we did, would have been equally deceived. When we told the missionaries of our troubles and perplexities on this occasion, they were very much amused, and said that they had at first been frequently puzzled, both at the bay and in travelling through the country, by the delusive appearances of the mirage, to which it required some time to become so accustomed as not to be misled. The bay, they said, from its shape, and the nature of the country about it, seemed to be peculiarly subject to those variations in the density and refractive power of the atmosphere which give rise to these singular effects. I have been thus particular in describing them, thinking that it may be of use to put my brother mariners on their guard against this source of deception on approaching a coast.

THE SECRET OF EDUCATION.

Repetition is the mother of all culture. Like the fresco painter, let the educator lay his colours on the wet chalk; they will dry in, indeed, but he will renew them again and again until they remain and bloom for ever.—*Richier*.

SPERM OIL—A FISCAL PARADOX.

The duty of L.12, 10s. per tun, until lately levied on sperm oil, has ceased and determined. On this event the 'Atlas' newspaper has the following observations:—'For the future, sperm oil will be obtainable for L.12, 10s. per tun less than it has hitherto cost; and from this circumstance it would seem to follow, as a natural inference, that the market price of the article should show a reduction to the amount. This, however, is not the fact. The price of sperm oil, on the remission of the duty, fell only from L.84 to L.82 per tun: the decline being L.2 instead of L.12, 10s., or less than one-sixth of the presumable abatement. This is one of those paradoxes which are frequently presented to the observer of commercial phenomena. By what recondite law of prices, or occult mercantile art, is the sudden disappearance of twelve and a-half from one scale balanced by the withdrawal of only two from the other? This is a fine case for the antagonists of free trade. There will not be wanting ignorant or unscrupulous champions of monopoly ready to argue that the difference between L.2 and L.12, 10s. will be pocketed by the merchants, instead of benefiting the consumer, and that the only effect of the vaunted commercial emancipation will be to swell the gains of a parasitic class at the expense of the public revenue. It is worth while to anticipate and refute an argument so plausible and so delusive. For this purpose it is only necessary to remind the reader of the influence of the past and the future on the present, in all human affairs, including commercial operations. For three years past the abolition of this duty has been looked forward to by the parties concerned, who have doubtless taken the prospect of reduction into account, as one element amongst others in the estimation of value, and the settlement of price: so that, when Monday last brought the anticipated change, a considerable proportion of its effect had already been incurred by anticipation. This is the effect of the past on the present. The influence of the future has an analogous tendency to abate the immediate decline of price. The holders naturally inquire what supplies are expected from the fisheries, and compare the probable imports with the probable demand. It so happens that at present the stock of sperm on hand is relatively low, and the fresh supplies of the year are not expected to be large. This acts as a further counterpoise to the diminution of value resulting from the abolition of the duty. The price of sperm oil may be described as having fallen the whole amount of L.12, 10s. per tun, in consequence of the fiscal change, and as having then recovered nearly its former level, in consequence of the real dearth. Had the dearth and the duty co-existed, the price would have been L.12, 10s. higher than it is: so that the benefit reaped by the public from the abatement of duty, though veiled by the contrary influence of an incidental scarcity, is not the less a real and positive saving to the full amount of L.12, 10s. per tun.'

Similar observations might be made in reference to the termination of the duty on leather a few years ago. No one gets shoes any cheaper in consequence of taking off this duty, say many persons. True; but this is in consequence of the demand for shoes having increased by the increase of population, and this demand keeps up the price of most kinds of shoes to the former level. Had the duty not been taken off, shoes would now have been so much dearer, because leather is an article which does not admit of a rapid and illimitable increase, like any kind of cloth, and the demand is continually pressing on the supply. Have the public, then, not received a benefit by the withdrawal of the duty on this article? Assuredly they have.

PROSPERITY AND PROGRESS.

From all we have seen for a century, the tide of affairs has set in in waves: any extraordinary advance has always been followed by a reflux. In vain is it bid 'be still;' for it is one of the conditions, and perhaps means, if not of the existence, at least of the progress of society—which, amidst all its perturbations, moves steadily up and down on the shores of time, under the dominion of a power that makes nations advance or recede, and under laws which can only be discovered by long, accurate, analysed observation. As statistical science and education advance, the severity of seasons of distress—whose general course can be calculated—will be diminished by mutual aid, and provision will be made in prosperity against their recurrence; as the losses of shipwreck, fire, and life to society are mitigated by the various kinds of insurance. Knowledge will banish panic. —*Ninth Report: Reg. Gen.*

MAIDENHOOD.

MAIDEN with the meek brown eyes,
In whose orbs a shadow lies,
Like the dusk in evening skies!

Thou, whose locks outshine the sun,
Golden tresses, wreathed in one,
As the braided streamlets run!

Standing, with reluctant feet,
Where the brook and river meet!
Womanhood and childhood fleet!

Gazing, with a timid glance,
On the brooklet's swift advance,
On the river's broad expanse!

Deep and still, that gliding stream
Beautiful to thee must seem,
As the river of a dream!

Then, why pause with indecision,
When bright angels in thy vision
Beckon thee to fields Elysian?

Seest thou shadows sailing by,
As the dove, with startled eye,
Sees the falcon's shadow fly?

Hear'st thou voices on the shore,
That our ears perceive no more,
Deafened by the cataract's roar?

Oh, thou child of many prayers!
Life hath quicksands—life hath snares:
Care and age come unawares!

Like the swell of some sweet tune,
Morn is risen into noon,
May glides onward into June.

Childhood is the bough where slumbered
Buds and blossoms many-numbered:
Age, that bough with snows encumbered.

Gather, then, each flower that grows,
When the young heart overflows,
To embalm that tent of snows.

Bear a lily in thy hand;
Gates of brass cannot withstand
One touch of that magic wand.

Bear through sorrow, wrong, and ruth,
In thy heart the dew of youth,
On thy lips the smile of truth.

Oh, that dew like balm shall steal
Into wounds that cannot heal,
Even as sleep our eyes doth seal.

And that smile, like sunshine, dart
Into many a sunless heart;
For a smile of God thou art.

—*Longfellow's Poems.*

SOLID MILK!

We observe in the Repertory of Patent Inventions for January, that a Mr Felix Louis of Southwark has enrolled a process for preserving cows' milk, goats' milk, and asses' milk, by converting the same into solid cakes or masses, which are soluble in warm water, and which may be kept for a long time without losing their original sweetness and freshness. The entire process, if we understand aright the terms of the specification, consists in a little sweetening by sugar, agitation, evaporation, and pressure.

THE BEST FRIEND.

The most agreeable of all companions is a simple, frank man, without any high pretensions to an oppressive greatness; one who loves life, and understands the use of it; obliging alike at all hours; above all, of a golden temper, and steadfast as an anchor. For such a one we gladly exchange the greatest genius, the most brilliant wit, the profoundest thinker.—*Lessing.*

REACTION AGAINST PHILANTHROPY.

THINGS are not at present looking well for philanthropy. The public is evidently turning against many of the schemes for lessening evil and promoting good which have occupied attention for some years past. For this we can see good reasons, and we do not entirely regret the reaction; but it is desirable that the ebb-tide should not go too far back, and it will be necessary that some other measures be taken to fulfil the same purposes in our social economy.

The late philanthropic paroxysm was itself a reaction from a previous state of indifference. We are not old; yet we can recollect the time when prisons were foul and unregulated, so as to form a real punishment both to the criminal and the debtor; when a group of human beings was hanged every month or so for shoplifting, forgery, and other secondary offences; when the condition of the very poor was little remarked, or only so to be passed over as a thing unavoidable, and not to be helped or interfered with; and when the idea of Night Asylums, Houses of Refuge, and Ragged Schools, had as yet visited no one's dreams. The heart and stomach of the public were then stout, and men in general were able to endure the ills of their neighbours with tranquillity. By and by Mrs Fry began to see after prisons, which in a little time were converted into quiet, cleanly workshops, where life had no drawback but only that of being a little solitary. Mr Owen and Mr Brougham raised an outcry about education, and soon the humbler denizens of the community found themselves in circumstances to gratify contending philanthropists of superior rank by allowing their children to go to school gratis. Humanity came into fashion; everything like vengeful punishment was given up, because the public could not stand it. It was discovered to be a great and paramount duty of all who could take any care of themselves, that they should also take care of all those who could or would not—see to their being fed and housed, kept in clean flannels, well-swept hearthstones, and honeysuckled doorways, provided with everything which the honest poor of old times had been accustomed to provide for themselves; in short, the every-body-do-for-every-body principle came to be the great motto of modern society. This has raged its time, and now we begin to see that the mass of crime and misery has not been lessened, but rather increased. It is shrewdly suspected that, in our anxiety to give succour, we have only relieved from responsibility, so as to propagate that which we had thought to repress. Many now begin to think that, after all, our ancestors were not so far wrong as they once appeared in demanding that every sound person should chiefly see to his own subsistence and that of his offspring, and in inflicting the punishment of neglect, if not one of a

more positive kind, where this alleged duty was not performed.

It must be admitted that the facts tend very much to show that humanity may be carried to a point where it defeats its own objects. During the forty years of philanthropy, commitments for offences have increased in their proportion to population sixfold. This cannot be to more than a fractionary extent the result of increased vigilance in the police, or of any similar cause. Seeing that it has gone on hand in hand with a continual softening of the lot of criminals, one cannot but think the two things in some degree connected as cause and effect, more particularly as we frequently hear of offences being committed directly for the purpose of securing a retreat in the comforts of the jail. One such fact as that the prison accommodation of an English county actually costs twenty-six pounds for each inmate per annum, exclusive of the charge for food, is sufficiently startling. Now the modern idea as to criminals—reform rather than punish them—is highly amiable, and entitled to honour, on account of the feelings from which it springs; but it may be a mistake, or it may be impracticable, and if fully proved to be less efficacious than the other plan, society is entitled to give it up. In our growing squeamishness, we have perhaps come to ignore punishment too much. The Providence which overrules all does not do so. It punishes imprudence and wickedness by disease and death every hour of every day. What if stern measures are ultimately the most humane after all?

During the same period, the regulated expenditure for the relief of poverty in all the various ways has increased enormously; and yet the number of beggars has not been lessened; neither has there been a diminution of the numbers of those poor people who, we are told, pine unrelieved. On the contrary, human patience is worn out with the importunities of ragged men, women, and children, in the streets of every large town; and the meaner parts of each city are now as much crammed with hopeless destitution as ever. About fourteen years ago, one hundred and forty thousand pounds was the outlay for the poor in Scotland through the regular channels: now the expenditure in the parishes is approaching half a million: there is a vast increase of beneficence in other ways; and yet there is more obtrusive mendicancy, and more obscure unreached wretchedness, than formerly. It follows that either society is going through a rapid course of demoralisation from causes independent of poverty, or that our late solicitude to take the burdens of individuals upon the public shoulders has resulted in this demoralisation, notwithstanding, it may be, an increase in the general resources of the community.

Even granting that the latter inference is only matter of suspicion, and not proved, all may well feel that it

forms a grave subject of deliberation. Each will probably have his own feelings as to how far we are called upon, by a regard for our fellow-creatures, to substitute for this system of impulsive philanthropy a policy, of which the leading feature should be, that individuals must be taught to trust mainly to themselves, their own exertions, and their own virtue, for what they require in their mortal pilgrimage. The tendency is now certainly towards this course, as if the errors of the past were already too notorious to be denied. It is in such circumstances that we find ourselves called upon for a few remarks.

First, then, it strikes us as but the simplest justice, as well as the best policy, that abrupt transitions should be avoided. If society has erred, and, by its error, created a multitude of dependents, it is only the duty of society to cut off this dependence with as little infliction of suffering as possible. It is, however, equally clear that no such change can be brought about without a very considerable amount of suffering; and for this let all be prepared. The poor will find themselves as in the hands of the surgeon, and the 'good souls' who look on cannot expect to escape without a few sympathetic twinges.

The grand means by which a more healthy system is to be restored, is undoubtedly a change in the expressions of popular opinion on the nature of society and its obligations. For some years past, most popular writers have strongly favoured such views as tend to make the child of humble toil believe himself the accredited nursing of society, instead of a being commissioned by nature to take his place in the general scene of industry, and employ his own faculties in providing for his own necessities, owing no man anything but love. It will now be necessary to look the primary law of nature in the face, that he who will not work, must want—a rule not at all interfering with the claim of humanity in favour of those unable for work, or who in some particular exigency cannot obtain employment, but which assuredly, in its general bearing, must be paramount to every other consideration. For what is the society which is looked to as that which must do for everybody, but only a cluster of persons who are obliged to work for everything which they possess? In what predicament would this society be if every unit composing it were, instead of working for himself, to expect that the rest should work for him? In that case it is easy to see that we should immediately be landed in all the practical difficulties of a vicious circle. A would be expecting B to help him, B would be looking to C, while C again was resting in expectation of aid from A and B. No one would be working, but all would be idle expectancy, and meanwhile starvation would be making its approaches. It is pure delusion to talk of property being saddled with any obligation, beyond what is imposed by humanity and expediency, to support the whole of those who may be, or who may represent themselves as being, in want; because property is open to every man, and is nothing but what may be saved by self-denial out of the aggregate results of industry. It is not apt to occur to those who allow themselves to look for or partake of the public beneficence, to what an extent they are a grievance and a discredit by so doing. Under protection of the universal tenderness towards meritorious and unavoidable poverty, they feel as if there were no dishonour in their circumstances, even while it is clear as mid-day that they might, by fair exertion, raise themselves into independence. Unreflecting as they are on the subject, it is but the tritest of facts, that the drain of the products of industry by the idle in all their various forms is a tremendous drag upon the social machine, and a continual cause of the production of fresh destitution—an evil constantly reproducing itself. No one can be entitled

to rank in equality with his fellow-creatures who, for any but the most compelling of causes, adds himself to this fatal burden. On the contrary, he ever must be a legitimate subject of contempt and reprobation to his neighbours.

Not only is it necessary for each to work, but even the responsibility for finding employment must mainly be left to the individual. On this point there has been fully as much fallacy as on any other. In fact society is no more bound to find work for any of its members, than to support any who will not work—humanity being here, as in the other case, the only claim which any one can have upon another. Were the opposite principle to be adopted, what test should society have that the individual had really been unable to obtain work, or had not rejected a fitting employment on improper grounds? A noble shelter it would be, indeed, for the indolent and the fastidious! How would it suit that the busy should have to seek for the work, while the disengaged waited till it was found? Let the community furnish work! And keep up national workshops where half work was done, and done badly, in ruinous competition with the independent industrious pursuing the same trades. We have all seen what this principle results in. No, no; there is but one simple plan for every unit of us—that he should get at something he can do, and do it, no matter what it is, if only the best thing he can do. Every aberration from this rule must be fatal while human nature remains as it is.

It might be worthy of consideration how far the recognised evils arising from failure of employment might be remedied by a system resembling that which supports Greenwich Hospital for the benefit of invalid sailors; namely, a regulated stoppage out of all wages realised by operatives. We have no calculations on the subject; but we have no doubt that a discount on pay, such as would scarcely tell on any man's ordinary comforts while in full employment, would provide a fund sufficient to succour all worthy persons accidentally thrown out of work, as well as soften those periodical failures of employment in large districts, and in particular branches of manufacture, which form so painful a feature of our present social condition. It appears to us that the state is as well entitled to come in and enforce such a system, as it is to lay on any taxes whatever for general objects. Situated as most working-men are, thus to give them even compulsorily the benefits which the middle-classes derive from their reserves of capital, would be a real boon; and, as such, it would probably come in time to be regarded by all those possessing any reflection or endowed with the spirit of independence. It is not to be contemplated as a substitute for poor-rates. The impotent poor might be provided for exactly as they are at present, while, to prevent all jealousy as to the relief of the middle-classes from any part of their existing burdens, it might be arranged that they should become contributors to the National Fund for the Unemployed to the extent of the present expenditure on behalf of able-bodied paupers.

By such plans, and by the never-failing humanity of such a society as ours, it may be expected that, even under an ascertained necessity for reaction against the present over-philanthropic schemes and movements, no monstrous outrage will be committed. Yet many complacent and self-indulgent illusions must be dispelled. We must not expect it to be wholly an affair of rose-water. The case is not that of a gentleman with money in his pockets going into a theatre to be amused, but that of a patient entering an hospital to be subjected to medical and surgical treatment. The increasing tendencies to crime and pauperism are, to all appearance, the exponents of fallacious systems. The systems must needs be changed before the symptoms will abate. One great source of the evil seems to be, our error as to the degree in which guilt and misery can be banished from the earth. For years past, the public has acted as if it hoped to regulate every impulse and dry every eye. Calm observation of

the materials we have to deal with shows this to be impossible. Human nature cannot be greatly changed in one or two generations. Civilisation has always been a plant of slow growth. Most undoubtedly, then, it were as wise to expect hot water under cold ice, as to look for a paradise in the present state of things. On the contrary, where there is so much temptation presented to natures so constituted, there will be much crime; and while men still act by impulse, instead of reason, there must be much resulting sorrow. We must, then, however painful it may be, submit to the idea that there will be pain. We must consent to take the world as God has given it to us—a scene of mingled weal and woe, where even happiness only can exist in contrast with its opposite, where want becomes the grand stimulus to the labours which create our enjoyments, and sorrow the great purificator of our spirits, and that which most effectually raises us above and beyond this limited and sordid scene.

MONTENEGRO.

THE eastern shores of the Adriatic, and contiguous islands, have been less explored by tourists than any other portions of Europe; and Mr Paton's wanderings come before the public with a promise of novelty very rare in these well-travelled times.* Although the promise, however, is redeemed, we cannot say that the result is quite so interesting as we expected. After descending the Illyrian Alps into Dalmatia (the main subject of the work), and getting somewhat accustomed to the difference of manners and costume, the continuous catalogue of little-known, or altogether unknown and unimportant names, becomes fatiguing. Nor is this made up for by any ideas of magnitude or wealth; for the whole country numbers only 400,000 inhabitants, giving 113 per square mile; and the uncultivated land (the greater proportion of which is incapable of cultivation) averages 80 per cent. of the surface.

But the comparative want of interest is not chargeable upon Mr Paton, who is an excellent scenic artist. Numerous bits of painting throughout the volumes will bear a comparison with anything of the kind in recent travels; and whenever he has anything to tell that is intelligible to the sympathies of his phlegmatic and exclusive countrymen, he tells it with effect. A trip he makes, for instance, beyond the line he had prescribed for himself, is full of interest, and, to most readers, of novelty. The scene is the mountain on which the extraordinary republic of Montenegro is perched, at one time an important fief of the Servian empire, with which it was, and is, completely identified in blood, language, and religion. To this part of the work we shall devote our exclusive attention; and although Mr Paton was accidentally prevented from enjoying more than a glimpse of the Montenegrines and their country, we shall be able to supply what is wanted from those Russian authorities to whom we owe almost all that is known on the subject.

When the Turks became masters of Servia in the fourteenth century, the Montenegrines were the only nobles of the empire who preserved their Christian faith: the mountain, whose fastnesses enabled them to secure their independence, rising, 'like Ararat, amid the overwhelming floods of Islamism.' Eventually it sank into the see of an archbishop, and was conquered by the Turks under Soliman the Magnificent; which event made converts to the faith of the prophet even on the

mountain itself. These renegades, however, were afterwards massacred, almost to a man, by one of the archbishops, in whose family the spiritual power, as well as predominating temporal influence, became hereditary. In the midst of a Mohammedan country which it defied, yet upon which it could make no impression, and nominally depending upon Russia, from which it received no support, Montenegro now sunk back into still darker than feudal barbarism, and its existence was almost forgotten in Europe. Then came the wars of Napoleon, which brought the mountaineers from their fastnesses; and then the treaty of Vienna, which declared the Adriatic province at the foot of the mountain a part of the Austrian dominions, but left the mountain itself an independent state, though acknowledging nominally, as before, the supremacy of Russia.

So much for the benefit of those who were unacquainted with Montenegro. The mountain appears almost to overhang the Austrian town of Cattaro on the Adriatic. 'At the extremity of the basin of Cattaro is situated the town, regularly fortified. A quay fronts the basin, and a plantation of poplars, rising with the masts of the vessels, under which the Bocchese, in their almost Turkish costume, prosecuted their business, produced a novelty of effect which one seldom sees on the beaten tracks of the tourist; and looking down the basin which I had traversed yesterday evening, a cluster of villas with their red roofs are seen shining among the thickly-planted gardens that cover the promontory stretching into the water. If we pass from the front to the back of the town, the rocks rise up perpendicularly behind the last street; so that the traveller, standing in the piazza in front of the church, is obliged to strain his neck in looking up to the battlements of the fort that surmounts the place.'

Mr Paton having determined to gratify his curiosity, put himself under the escort of a Dalmatian Dugald Dalgetty, with whom he began the ascent of the mountain. 'The shaggy brown mare of the trooper was caparisoned in the Turkish way, with a high cantled cloth saddle, and a silver chain forming part of the bridle. Instead of the long Oriental robes of yesterday, in which I was introduced to him, he wore a short crimson jacket, lined with sable, a silver-hilted sword being hung from his shoulder; while our attendants carried long Albanian rifles, their small butts covered with mother-of-pearl, and the men with coarse frieze dresses, tattered sandals, weather-beaten faces, and long uncombed locks falling over their necks.' The Velle-bitch, called the ladder-road of Cattaro, leads along a face of rock 4000 feet high, and 'very little out of the perpendicular. There could not be less than fifty zig-zags, one over the other, and, seen from above, the road looks like a coil of ropes. As we passed one tower of the fortress after another, the whole region of Cattaro was seen as from a balloon; the ships were visible only by their decks; and I do not overstrain description when I say that, arrived at the top, although we were very little out of the perpendicular above Cattaro, the human figures on the bright yellow gravelled quay were such faint black specks, that the naked eye could scarce perceive them; so that the independence of Montenegro ceases to be a riddle to whomsoever ascends this road. When standing on the quay of Cattaro, how high and gloom-engendering seem those mountains on the other side of the gulf, as seen from below! I now look down upon their crests, and dilate sight and sense by casting my eyes beyond them upon the wide blue sheet of the Adriatic, the height of the line where sky meets sea showing how loftily I am placed.'

On arriving at the top of the ladder, he was in Montenegro, and after crossing a desert plateau, and surmounting another ridge, looked down into 'a sort of punch-bowl, the bottom of which was a perfectly level circular plain of rich, carefully-cultivated land, an oasis in this wilderness of rocks. . . . Here all the inhabitants had clothes of frieze, resembling closely those of Bulgaria; but instead of the woolly caps, many of them wore

* Highlands and Islands of the Adriatic, and the Southern Provinces of the Austrian Empire. By A. A. Paton. 2 vols. Chapman and Hall. London. 1849.

black skull-caps, and wide trousers and tights from the knee to the ankle; those who lounged about having a *strookah*, which is like the Turkish cloak, but of a dirty white colour, and the pile inwards so long, coarse, and shaggy, as to be like the fleece of a sheep. The necks and breasts of the men were bare, and all wore miserable sandals. Each male wore arms, the waist-belt, like that of an Albanian, showing a bundle of pistols and dirks, which brought to mind the old heraldic motto, "Aye ready!" So predominant, indeed, is the idea of the soldier over that of the citizen, that even when a child is baptised, pistols are put to the infant's mouth to kiss, and then laid in the cradle beside him; and one of the favourite toasts drunk on the occasion is, "May he never die in his bed!" The dress of the women was of dirty white cloth; and in cut, its family likeness to the old costume of Servia is recognisable; but the details are coarser, and show a poorer and more barbarous people.

On entering one of the cottages, through a whirlwind of smoke issuing by the door, its only path of egress, he saw that it was divided into three compartments, separated by rude basketwork—one for the family, one for cattle, and one for sheep. 'Like the Noah's Ark or Nativity of the older Flemish painters, a sunbeam darted through a hole on smoked rafters and an old chest, and the cattle were seen in the dim depths of the recess.

'We now remounted, and began the ascent of the last crest of the chain; every scrap of earth preserved in the hill-side being carefully cleared of stones, and fenced round. Higher up was a wood, having, like the inhabitants, all the signs of the niggardly penury of nature: soon every trace of vegetation ceased, the road was a faint track in the rocks, and an eagle, screaming from cliff to cliff, was the only object that invaded the monotony of our way; but on gaining the spot where the waters parted, the prospect that spread out before us seemed boundless.' Such is the salubrity of the climate here, that the French resident mentions having 'met with a man who had lived to see the sixth generation of his family; the old man himself being 117 years of age; his son 100; his grandson nearly 82; his great-grandson had attained his 60th year; the son of the latter was 43; his son 21; and his grandchild 2 years of age.'

Cetigne, the capital of this extraordinary territory, he describes as being rather a fortified convent, surrounded by scattered houses, than a town; but there is a large government-house, styled the Archiepiscopal Palace, and an inn uniting the characters of a European hotel and an Asiatic khan. The vladika, or archbishop, was absent at the time; but our traveller was shown by the archimandrite the convent, containing a school-room, where thirty-two boys were at work on the elements of knowledge. 'All the other parts of the establishment are of the most primitive kind; a circular space for thrashing corn, of the exact circumference of the great bell of Moscow; beehives of hollowed trunks of trees, and everything betokening such a state of manners as might have existed in our own country in feudal times. An old wooden door on the ground-floor met our view, being the stable of the vladika, containing a milk-white Arab, presented to him by the pacha of Bosnia; a new iron door beside it was that of the powder magazine; an imprudent position, for if the convent took fire from above, an explosion, such as would level the whole edifice, would be the infallible result. . . . A hundred yards off is the new Government-House, built by the present vladika; and going thither, we found a billiard-room, to combine pleasure and business, in which the senate was then sitting. The brother of the vladika was seated at the upper end of the room on a black leather easy-chair, smoking a pipe. A large portrait of Peter the Great in oil, a smaller one of Kara George, and prints of Byron and Napoleon, hung from the walls. There was no bar, as in the Houses of Lords and Commons; but a billiard-table, on which the vladika

is said to be a first-rate performer, separated the upper from the lower end of the apartment. A senate of course ought not to be without the ushers of the black and white rod: I accordingly saw in a corner a bundle of these insignia; but on observing their ends marked with chalk, I concluded that they belonged to the billiard establishment. An appeal case was going on, and a gigantic broad-shouldered man, with his belt full of pistols, was pleading his cause with great animation. It appeared that he was a priest; that his parishioners owed him each ten okas of grain per annum, but this year could not pay him; and the president decided that he should remit as much as possible on the score of the bad times, but that he should keep an account, and be repaid at a more prosperous season. The senators sat all round the room, each man being armed, and the discussions often extremely vociferous. There are no written laws in Montenegro, and there is no venality, as in the Turkish courts of justice; but they lean somewhat to the side of the most warlike litigant, so that it may be said that club-law has not yet ceased.'

This spirit is kept up by the petty warfare which still goes on on the borders of the Lake of Scutari, where bands of forty or fifty Montenegrines descend every now and then to 'lift' the cattle of the Moslem. 'It never strikes the Montenegrine that this is immoral, the shedding of the blood of a Moslem being in his eyes not only lawful, but laudable; and a mother will often reproach her laggard son by contrasting his remaining at home with their father, who killed such and such a number of Turks. The result of this is, that all the debateable land is cultivated by men armed to the teeth. . . . But robberies or theft within the Montenegrine territory are rare. When an execution does take place, it has all the singularity of the rest of their manners. Representatives of all the forty tribes assemble with loaded guns, and the criminal, with his hands bound behind him, has a short space to run, when all fire upon him, and he is generally despatched; but instances have been known of his getting off with a wound.'

It is not surprising that in such a country the *lex talionis* should be the law of the land. Feuds are handed down from generation to generation, between families, villages, and even branches of the same family. 'To remedy the evil, courts of compensation were called, and the blood redeemed with money; but this was a very solemn affair, and a hundred and thirty-two ducats, four Austrian zwanzigers, and a Turkish parah, or about sixty pounds sterling, was the ransom for a death, and about half that sum for an eye and a limb. The ceremonies of reconciliation were very curious. The judge was always a stranger, generally a priest; and the expenses of the court being settled beforehand, the judge took all the arms from the parties, and never returned them until all claims were settled. In the case of feuds of families, the murderer presented himself on his knees, with the pistol or other arms hung round his neck, and begged pardon in the name of God and St John. If the avenging party raised him, and embraced him, he was pardoned; and sometimes the avenging relations stood godfather for the child of the offender. At each treaty of peace the Turkish parah was cut in two, and tied to the written treaty; and an entertainment, at the expense of the offender, closed the feud. Even in the Austrian territory amusing arrears of insult or injury were brought up for settlement; and in spite of Austrian laws, these courts of reconciliation were held, until lately, in the circle of Cattaro, quite independently of Austrian local authority. In the territory of the Pastrovich, a savage tribe in Austrian Albania, one village demanded of another fifty ducats for an insult that one of their women had received from some Venetian soldiers, in the time of that republic, through the supineness or pusillanimity of the village in question; and an old man of seventy being referred to, related that he had heard the matter stated in his youth; but how the dispute was settled does not appear.'

The present government of Montenegro, however,

according to M. Broniewski, one of the Russian authors we have alluded to, has effected something. The communities still refuse to deliver up a murderer, but they permit the burning down of his house and confiscation of his cattle. The sentence is executed by the chiefs of villages, who divide the spoil among them; and the criminal, thus deprived of home and property, betakes himself to some distant cavern, and becomes a robber. On the rare occasion when an execution takes place, no one person can officiate, or he would expose himself to the vengeance of the family; but—as it happened in 1836, when two malefactors were to be put to death at Cetigne—several hundred persons from different districts fire their rifles at once upon the condemned. In the case alluded to, one of the men was killed, and the other only wounded; but the latter was considered to have paid the penalty of the law as well as the former, and he was cured of his wounds, and set free.

‘A Montenegrine,’ says M. Broniewski, ‘is always armed, and carries about, during his most peaceful occupation, a rifle, pistols, a yatagan, and a cartouch-box. The Montenegrines spend their leisure time in firing at a target, and are accustomed to this exercise from their boyish years. Their very games and amusements bear the stamp of a military character, and they are admitted by all to be most skilful shots. Being inured to hardships and privations, they perform, without fatigue, and in high spirits, very long and forced marches. They leap over wide ditches, supporting themselves on their long rifles, and pass over precipices where bridges would be absolutely requisite for every other kind of troops, and they climb the steepest rocks with great facility; they also bear with the greatest patience hunger, thirst, and every kind of privation. . . . When the enemy is in great force, they burn their villages, devastate their fields, and, after having enticed him into the mountains, they surround him, and attack him in a most desperate manner. . . . When, at the attack of Clobuck, a little detachment of our troops was obliged to retreat, an officer of stout make, and no longer young, fell on the ground from exhaustion. A Montenegrine perceiving it, ran immediately to him, and having drawn his yatagan, said, “You are very brave, and must wish that I should cut off your head. Say a prayer, and make the sign of the cross.” The officer, horrified at the proposition, made an effort to rise, and rejoined his comrades with the assistance of the friendly Montenegrine. . . . Arms, a small loaf of bread, a cheese, some garlic, a little brandy, an old garment, and two pair of sandals made of raw hide, form all the equipage of the Montenegrines. On their march they do not seek any shelter from rain or cold. In rainy weather the Montenegrine wraps his head with the *strookah* (a shawl of coarse cloth), lies down on the ground where he stood, and putting his rifle under him, sleeps very comfortably.’ On visiting one of the villages, ‘a young woman (the youngest daughter-in-law of the family) entered the room with a wooden bowl filled with water; she bowed with great timidity; kissed the hem of my garment and the hand of my sailor, who jumped up at this mark of respect; she then pulled off my boots, examined them with great curiosity, took off my stockings, and washed my feet, as well as those of my sailor. After this the Kniaz proposed to me the Pascha (Easter cake), and all the family gave me and my companion the Eastern salutation. After this, water was presented to wash our hands, a candle was lighted before the images, prayers were said, and supper, consisting of a boiled fowl and smoked mutton, was brought. The master of the house alone sat down with us at table, the children served, and several persons who had entered the room stood looking at us and talking.’ The next morning he was obliged to visit at least twenty families, and take food, or at least taste it, with each of them. ‘On entering, as well as on leaving each house, I was obliged to kiss every member of the family; and whenever I gave a child a little lump of sugar, I was kissed again by every one in the house. At last, after

having kissed the whole village several times over and over, my mule was brought, and I mounted it, accompanied by loud wishes for a happy voyage, and amidst firing of muskets. My sailor was made so drunk, that it was necessary to stretch him across the donkey. I must not forget that, in passing from one house to another, I was formally delivered from one’s hands into others, like a chattel, with an injunction to keep me as the apple of their eye.’

The history of a curious imposture practised upon this primitive people is given by Mr Paton, and it exemplifies in a striking manner their attachment to their nominal superior the czar. In the year 1760, an Austrian soldier of the name of Stephen Mali, a young man of lazy habits, and otherwise bad character, deserted the service, and made his way to Montenegro, where he became servant to a sort of doctor. Stephen soon tired of his new employment; and hearing on all sides the story of Peter the Great living at Saardam as a shipwright, it inspired him with the idea of becoming a great man himself. He told his master—who had formed a high opinion of him—that he himself was Peter; and that, desiring to see with his own eyes a little more of the world before returning home, he had come to visit his friends the Montenegrines *incog*. The good doctor believed every word of the story, and falling down upon his knees, kissed the hand of the czar; and soon it was current in the Mountain that the Great Peter was among them. He was treated according to his assumed rank, and soon acquired so much influence, that his authority became greater than that of the archbishop, at that time an old and infirm man. What made his fortune, however, was the hostility of the Turkish officials. They pronounced him to be an impostor, and from that moment every man in the Mountain believed him to be the true czar. ‘At last the court of Russia, to undeceive the people, sent Prince Dolgorouki to Montenegro, properly accredited to the archbishop, who assembled all the people, and declared him to be an impostor. Stephen was therefore placed under arrest, and taken to the upper floor of the convent. The door being left open, he sat in a corner, while his old admirers still thronged in and conversed with him; the archbishop and Dolgorouki, on the ground-floor, thinking the whole business about to be concluded. But Stephen’s resources were not at an end. Calling one of the most influential men, to speak a few words with him in private, he said, “There is the key of my box; go to the convent of Sermitza, open it, and take the money in it. Leave Montenegro immediately, and go to Russia; and after telling my faithful people how I have been betrayed by my own subject, bring back the principal men of the empire to deliver me from Dolgorouki, who, you see, traitor though he be, lodges me over his head, and does not dare to put me below him.” The consequence was, that Dolgorouki left the Mountain branded as an impostor, and Stephen, once more a great man, assured everybody that the Paschalics of Scutari and Ipek were the righteous appendages of Montenegro.’

Stephen, in fact, was so clever a fellow, that although he wanted physical courage, a quality so much prized in Montenegro, it is hard to say when the farce would have ended, had not the pacha of Scutari hastened the *dénouement* by employing the dagger of an assassin. ‘The rule of Stephen lasted between three and four years, and ought to find a place in every book of popular delusions and impostures. It is evident that, with good education, a good position, and, above all, with common honesty, Stephen would have been a historical character. His knowledge of human nature in its strength and weakness must have been prodigious; and like Hakem, the mad caliph of Cairo, he kept so strict an observance of the laws of *meum* and *tuum*, that a sum of money placed on the public road would remain there untouched and unstolen.’

We must now take leave of Mr Paton, only saying from the other authority, that the scene of these curious

events is a territory about sixty English miles by thirty-five, containing somewhat more than one hundred villages, the largest with a population of about 1000. Montenegro can always send into the field 15,000 armed men; but twice the number may be raised for the defence of the country.

BOATSWAIN.

WITHIN the precincts of Windsor Castle there is a small marble monument, on which may be read the following inscription:—

BENEATH THIS SPOT
ARE DEPOSITED THE REMAINS OF A BEING
WHO WAS POSSESSED OF BEAUTY WITHOUT VANITY,
STRENGTH WITHOUT INSOLENCE,
COURAGE WITHOUT FEROCITY,
AND ALL THE VIRTUES OF MAN WITHOUT HIS VICES.
THIS PRAISE WOULD BE BUT EMPTY FLATTERY
WERE IT INSCRIBED UPON THE ASHES OF A HUMAN BEING,
AND YET IT IS ONLY WHAT IS DUE TO THE MEMORY
OF THE DOG BOATSWAIN:
BORN IN NEWFOUNDLAND MAY 1801—
DIED AT WINDSOR 18TH NOVEMBER 1815.

Some few particulars regarding this remarkable dog, who, though unknown to fame, bore no inconsiderable part in the history of his day, may not be unacceptable to our readers.

Boatswain was born in Newfoundland, as his epitaph sets forth, in the month of May 1801. He was brought to England, while still a pup, by Captain Philips of the Royal Navy, who undertook the charge of his early nurture and education. The pupil quickly rewarded his master's care by the rapid development of his superior qualities. At two years old, Boatswain was the finest animal of his breed that was anywhere to be met with: his coat was of an iron-gray colour, spotted with tan; he had a majestic head, eyes full of fire, and yet of gentleness, and a broad well-formed tail, which seemed to be continually in movement. To all this it must be added that he was generous, brave, and disinterested—in fact, possessed of all the virtues which are enumerated in his epitaph. It will therefore be readily understood that Captain Philips's dog soon became a universal favourite, and it was not long before his fame reached the ears of the Prince of Wales, who laughingly offered promotion to the captain if he would make him a present of his dog. Philips was much vexed, but replied, as in duty bound, that he would be only too happy to have it in his power to contribute in anyway to the pleasure of his Royal Highness. In the course of two days after this conversation, Boatswain was transferred to Windsor, where an elegant little pavilion, in the Chinese style, was constructed expressly for his use.

Up to the year 1804, Boatswain contented himself with basking in the sunshine of courtly ease. At this period, however, he began to bear a part in the politics of the day. England was on the point of a rupture with France, and the ministry were very desirous of securing, without further delay, the co-operation of the northern powers. Matters had not, however, as yet been brought definitively to a point. At this period the diplomatic body were one day invited to share the courtly hospitality of Carlton House; and they had not been long assembled before the P— ambassador was engaged in an animated conversation with the Prince of Wales, who, although at this time exercising but little sway over his father's counsels, could not but feel interested, both as an Englishman, and as heir to the British throne, in the success of the negotiations which

were then on foot. At a little distance stood one of the envoys from the French court, a skilful diplomatist, who enjoyed the unbounded confidence of the First Consul. The prince was seeking, with all that graceful and winning eloquence which he so well knew how to employ, to convince the ambassador of the advantages which would accrue to all parties from the great northern powers uniting with England in an offensive and defensive alliance. The ambassador, still unconvinced, made only evasive replies to all the arguments employed by his royal host; and feeling himself somewhat hard pressed, was not a little relieved when Boatswain, who was often on these occasions a favoured guest, came bounding joyously into the room.

'What a noble animal!' exclaimed the P— ambassador.

'Yes,' replied the prince, 'he is a fine fellow, and all trained into the bargain. He is a first-rate fetcher and carrier, as I will prove to you directly.'

Boatswain was standing by the side of the French envoy, and seemed to be chewing something between his teeth.

'Here, Boatswain!' exclaimed the prince. The dog advanced towards him, and with an inimitable grace peculiar to himself, presented him an open letter. 'This is doubtless some stray paper which he has picked up in my study,' said the prince, taking it from the animal, and glancing hastily at its contents. It was addressed to the French envoy, and contained only these few words:—

'SIR—I am writing to my ambassador, as well as to yourself, this matter being one of the utmost importance. Any *rapprochement* between the court of St James's and the P— ambassador must be prevented, no matter at what cost. The latter is a man of a narrow and self-sufficient mind: you will not find it very difficult to influence him.

BONAPARTE, *First Consul*.'

When his Royal Highness had perused this document, he turned towards the ambassador, and said with a smile, 'Boatswain made a yet happier discovery than I had anticipated—he has brought to light something which concerns your excellency.'

'Me!' exclaimed the diplomatist.

'Yes: read this, and judge for yourself.'

The ambassador read as he was desired, and the First Consul's letter effected more in one moment than the prince's eloquence in an hour. From this day forward the irritated diplomatist became the most ardent partisan of war, and his despatches to his own government decided the king of P— in favour of the coalition.

Such was the first act of Boatswain's political career, which had its share in producing one of the bloodiest wars that has desolated Europe. He, in the meanwhile, all unconscious of the part he bore in these great events, lost nothing of the original simplicity and modesty of his character; and indeed it must be confessed that not long after this, his reputation, subject to the mutability of all human affairs, began somewhat to diminish in the world. The prince's passion for dogs became merged in one for horses, and he made a present of his old favourite to the well-known Beau Brummell. He sold it for three hundred guineas to the Duke of Richmond, the duke for two hundred to the Marquis of Argyle, the marquis for a hundred and fifty to Viscount Hereford, and the viscount for ninety to Lord Ross. It was evident that Boatswain was no longer held in due estimation. At last, however, he was so fortunate as to find a master who was worthy of him. Lord Ross gave him to a physician, who was also a fellow of the Royal Society. This new owner happened to be one of those original men who hold animals in higher esteem than they do their fellow-creatures in general. He consequently attached himself warmly to Boatswain,

who fully returned his affection. Before long, our *savant* sought permission to visit France, a permission at that time accorded *only* to literary men; for Bonaparte, with all his faults, never made war against science. Not satisfied with this concession, the doctor also sought and obtained an interview with the Emperor at St Cloud. Napoleon received his guest at his breakfast table, and as he sipped his cup of chocolate, discussed divers scientific subjects, until their conversation was interrupted by a low and long-continued moaning at the door. Bonaparte rose to see from whence this noise proceeded.

'Sire,' replied the doctor, who was, as we have said, an original, 'it is only one of my friends who is at the door; and as he is seldom absent from my side, he is complaining after his own fashion.'

'Well,' replied the Emperor graciously, 'I shall be charmed at having the pleasure of making your friend's acquaintance.'

The door was accordingly opened, and Boatswain, with a thousand gambols, bounded towards his master; but, as ill-luck would have it, in his joyous career he overset a splendid vase of Sèvres china, and shattered it to atoms. The agonized *savant* seized a chair, and was about to fling it at the dog, when Napoleon calmly arrested him, saying, 'Sir, the *vase* can easily be replaced, but such a *dog* as this it would be hard to match; I must therefore plead for his forgiveness.'

The doctor did not require to be asked a second time to pardon his favourite; and Boatswain, who seemed perfectly well aware of all that had passed, turned towards his protector with a sparkling and grateful eye. Bonaparte patted his head, and said, turning towards the doctor, 'It is not often that *men* are as grateful. What a pity it is that this dumb animal has not as good a memory as they?'

'Sire,' replied the Englishman, 'Boatswain *seldom* forgets an *injury*, and *never* a *kindness*.'

'Ah!' said Napoleon sadly; 'is it so? Then, sir, thanks to you, this day has not been lost.' Boatswain wagged his tail, as if to certify to the Emperor that he was not mistaken.

Thus terminated the audience. The doctor returned to his island home: Bonaparte went forth at the head of his victorious armies; but soon was he destined to be arrested in his triumphant career. In 1814, as is well known, he was precipitated from the imperial throne, and banished to the sea-girt prison of the island of Elba.

In the meantime our friend Boatswain was growing old in one of the suburbs of London. His master, the *savant*, was dead, and the faithful animal had passed, with the rest of his property, into the hands of his heir. It is said that his faculties were beginning to fail him, and he led the quiet contemplative life of a philosopher, who has seen much, reflected much, and come to the conclusion that the less we try to meddle with the government of the world, the better it is likely to be, both as concerns ourselves and others.

His quondam protector, Napoleon Bonaparte, was, unfortunately, not of the same opinion. In his retreat, he was busily engaged in planning the means of re-entering France, and meditating over new campaigns; though few who witnessed the care with which he attended to the government of his miniature kingdom, and the general easy *insouciance* of his demeanour, could have supposed him to be labouring with such vast designs. In one of his rambles on the shore during this anxious interval, he encountered some of the officers of an English man-of-war, which was lying off the island. They requested from one of his suite the honour of being presented to the Emperor—a request readily acceded to. A circle was quickly formed, the captain improvised an address, to which Bonaparte was commencing a courteous reply, when suddenly an enormous dog, dashing into the midst of the group, came bounding towards the Emperor, and with every demonstration of joy, laid himself at his feet.

'Down, Boatswain, down!' exclaimed the captain, looking much discomposed.

On hearing the name of Boatswain, Bonaparte smiled, and turning to the young man, whilst with one hand he caressed the noble animal, he said, 'May I ask who gave you this dog?'

'Sire, he belonged to my father.'

'You are then the son of Dr M——?'

'Yes, sire,' replied the captain with a bow.

'I am delighted to hear it, sir, both for your sake and mine. It has also procured me the pleasure of seeing once more an old protégé of mine, whom I recognise by his gratitude as well as by his name.' He then narrated to the officer the adventure at St Cloud.

On the day succeeding this rencontre, there was a grand ball at Porto-Ferraio. All the guests were already assembled; they were only awaiting the Emperor. But few amongst them were aware that at that moment Bonaparte, profiting by the darkness of the night, was marching towards the port at the head of his grenadiers. 'We are going to France!' whispered the veterans one to another, as they marched onwards amidst the distant rolling of the storm. Towards the sea the sky was illuminated from time to time by a vivid flash of lightning, which seemed to point out to the exiled soldiers their only pathway towards that home which they loved so well. Already the little band had reached the shore, when suddenly a tumult was heard amongst the advanced guard.

The Emperor inquired the cause.

'Sire, it is an Englishman, who has just been arrested on suspicion of being a spy. The soldiers were with difficulty restrained from massacring him on the spot.'

Napoleon immediately gave orders that the prisoner should be strictly guarded, and brought on board ship with them, in order that he might not give the alarm. They now commenced the embarkation, to accomplish which, each was obliged to pass into the boats over a long plank. In doing this, Bonaparte lost his equilibrium, and fell into the sea, which at that spot was already very deep. From the darkness of the night, and in the confusion of the moment, his disappearance was not perceived. Farewell to the double revolution of the Hundred Days!—farewell to the battle of Waterloo!—to the tragedy of St Helena! It seemed as if the warrior's career was now about to close for ever. But that Providence, which often accomplishes great ends by trivial means, had ordered it otherwise. Swifter than lightning, a dark body was seen to plunge into the water, and after diving three times, to reappear with the body of Napoleon! It was Boatswain, who was acquitting himself of the debt he had contracted at St Cloud!

When they reached the ship, the Emperor changed his clothes; and on mounting to the deck, quickly recognised in the prisoner Captain M——, his acquaintance of the preceding day.

'Ah! is it you, sir?' exclaimed Bonaparte with a smile. 'It seems that you are in the habit of taking very early walks?'

'Sire,' replied the prisoner, 'I was waiting for my boat to return to my ship, and imagined every one else was at the ball; but it seems to me that I have been taken prisoner without any declaration of war.'

'It is an English habit,' replied the Emperor, still smiling. 'But where is my friend Boatswain?'

'He has been shut up, sire, lest his familiarities should prove troublesome to you.'

'Would to Heaven,' said Napoleon with a sigh, 'that all my friends resembled him! But *à propos*, sir, does this arrest inconvenience you much?'

'It does indeed most seriously: I was just about to set sail for England.'

'Well, then, we will give you a passage thither *gratis* through France; perhaps I may even have the honour of conducting you myself to London!'

How *this* brief dream of glory ended is well known to all. As for Boatswain, the real hero of our story, he

was brought back in safety to England, and died not long after in his old abode in Windsor Park, where he had been reinstated by order of the Prince Regent, who caused the above epitaph to be engraven on his tomb.

THE VEGETABLE COLONISATION OF THE BRITISH ISLES.

FROM THE FRENCH OF M. CHARLES MARTINS.

THE question as to plants, whether each species originates where we now see it existing, or whether there are certain centres whence vegetables are radiated over the earth's surface, will probably long divide the opinions of philosophical naturalists. Some contend that species are actually native to the regions where they are found flourishing, while others admit of great vegetable migrations analogous to those of the human race. Long since, botanists remarked that certain islands have a Flora which is peculiar to them, while others do not present a single plant which is not also found on the adjoining continent. The British islands are in this latter position; but we shall not limit ourselves to the study of their vegetation, but endeavour to pursue the vegetable migrations through that series of archipelagos, islands, and islets which, under the names of the Orkneys, the Shetland and Farøe Islands, and of Iceland, form the only chain which unites Central Europe with Northern America.

In studying the botanical geography of the British islands, we may take for our guides the excellent works of Mr Hewett Watson and Mr Edward Forbes; both having carefully explored their country, the former as a botanist, the latter as a zoologist and geologist. One important leading fact sums up the general results at which these philosophers have arrived; namely, that the British isles do not present a single plant that is peculiar to them, and which cannot also be found in continental Europe; but the various plants found on these islands do not all come from the same regions. We shall endeavour to enumerate the various vegetable migrations which, according to these observers, have successively colonised Britain:—

The Asturian Type.—On account of the mildness of its winters, Ireland offers to our notice the remains of a Spanish Flora. There are found in its south-west districts twelve plants which came originally from the Asturias, and which are the last representatives of a colony whose starting-point was the north of Spain.

The Armorican Type.—The south-west of England and the south-east of Ireland exhibit a vegetation whose analogy to that of Brittany and Normandy has long excited the attention of botanists. Many southern species are found along the western coasts of France, till the increasing rigour of the climate arrests their migration northwards; a certain number still existing, in consequence of the mildness of the winter, on the peninsula, at the extremity of which Cherbourg is placed. These plants have spread to the coasts of Devon and Cornwall, and gaining from thence the opposite shores of Ireland, have become naturalised in the counties of Cork and Waterford.

Boreal Type.—The mountains of Scotland, Cumberland, and Wales present to the botanist quite a peculiar vegetation, and one in every way different from that of the plains of England. Analogous to that of Switzerland, it offers a still more striking resemblance to the Flora of Lapland, Iceland, and Greenland. The greater number of plants which are found on the summits of the mountains of Scotland, vegetate at the level of the sea in the isles of the Northern Ocean.

Germanic Type.—This is the prevalent and fundamental one of England, which, originating in the north of France and Germany, has in the lapse of ages become so predominant, that most English botanists designate it as the British type. A certain number of the plants found on the English side of St George's Channel have never crossed it, and are unknown in Ireland. So, too, certain animals, much diffused in Germany, seem con-

fined in England to those regions wherein the Germanic Flora exclusively prevails. Thus the hare, squirrel, dormouse, polecat, and mole, are not native to Ireland. Only five species of reptile are found in that island, while eleven exist in England, and twenty-six in Belgium, the starting-point of the Germanic migration. Certain living mollusca are distributed in like manner.

The marine plants and animals of the British isles follow the same laws of distribution as govern that of the terrestrial Flora and Fauna. Certain kinds of algae, peculiar to southern seas, are found only on the western shores of England; and certain species of fish are there taken which never pass the Pas de Calais (Straits of Dover)—the Neptunian representatives of the Asturian and Armorican types. Just so, too, the herring, cod, and whiting abound only in the North Sea, along the eastern coasts, where the Germanic type of vegetation prevails. Lastly, the large cetaceous tribes (whales, &c.), even in the depths of the ocean, seem to observe the ideal boundary which separates the boreal vegetation of Scotland and England from the more southern Floras of Cornwall and the south of Ireland.

Up to the present time, naturalists had seen in this regional distribution of living beings only a natural consequence of the all-powerful influences of soil and climate. It first occurred to Mr Edward Forbes that this explanation was insufficient. He believed he recognised in it vestiges of a state of things no longer enduring, proofs of the existence of hotter or colder climates than now prevail, and indications of a configuration of land and sea, of which the depths of the ocean conceal the traces. The twelve Asturian plants found on the south-west of Ireland are, in his opinion, the remains of the most ancient vegetable colony of the British islands. The distance of their continental origin, the vast gulf which now separates them from the mother country, the difference of climates, and the small number of surviving species, all announce an ancient origin, and an order of things quite different from that which now prevails. A sea once covered a large portion of the south of Europe and the north of Africa, as is proved by the numerous and identical fossil shells found at numberless points, from the isles of Greece to the south of France. According to Mr Forbes, the upheaval of the bed of this ocean, which constitutes the latest tertiary deposits, gave rise to a vast continent, comprising Spain, Ireland, a part of the north of Africa, the Azores, and the Canaries. He further refers the appearance of the Armorican type, connected as it is with a mild temperature, to the period when this continent existed.

The submersion of this continent was followed by a period during which a far lower temperature prevailed, and during which the migration of arctic plants, now found only in mountainous regions, took place. There are abundant proofs that in the north of Europe a glacial period immediately preceded that in which we live. Without referring to the numerous traces of the existence of glaciers in the mountainous regions of the United Kingdom, the *drift* of the northern portions of it contains the remains of animals now only found in the depths of the Frozen Ocean, and on the coasts of Iceland and Greenland. During this period, then, England was in part covered by waters, the temperature of which resembled that of the Frozen Ocean, and formed not a continuous country, but groups of islets—the mountains of Scotland, Wales, and Cumberland alone rising above the waves. A climate analogous to that of Iceland prevailed in this archipelago: the summits of its mountains, like those of Hecla, were covered with perpetual snow, and glaciers descended along its valleys to the sea. The plants of Greenland, Iceland, and Norway, were transported thither by oceanic currents or floating ice; and these are the vegetables that still flourish in the mountainous regions.

At the end of this glacial period the British islands were gradually upheaved into their present confor-

mation—the higher points becoming still higher, and the oceanic depths more shallow. The sea becoming warmer, its shores have been invaded by the animals which still people it; but as at great depths the change of temperature is much less sensible, animals of the glacial period have been enabled to remain here. Thus, Mr Forbes observes, at depths of from 500 to 650 feet, the mollusca of the arctic seas are found, and even a great number of shells, which are only found in the fossil state in the drift or stratum of the glacial period existing in the north of Britain. From such facts, he concludes that the deeper portions of the British seas conceal a population which, like the plants of the Scotch Alps, originated in the glacial period.

During these two geological epochs, England and France were united, the English Channel and the Straits of Dover not then existing; and geologists unite in considering the separation of the two countries as a comparatively modern event. The plants of France and Germany invaded the recently-emerged territory; the hardy vegetation of the north occupying the greater portion. Forests as dense as those of Germany then covered the coasts of England: gigantic stags, and lost species of the ox, the bear, the wolf, and the fox, alone inhabited these vast solitudes. The great Germanic vegetable invasion, so to speak, absorbed all the others, a few traces of these alone remaining. Thus while the Asturian plants were reduced to a few species confined to the south-west of Ireland, the hardy plants of the north completed the conquest, and possessed themselves of the soil. This colonisation finished, England became separated from the continent—a geological event insignificant in itself, but which has in its moral results exercised an immense influence on the destinies of the world.

While Messrs Forbes and Watson were engaged in proving the continental origin of the plants and animals of England, I was studying the vegetable colonisation of the Shetland and Farøe Isles, and of Iceland. These islands form a continuous chain, so to speak, connecting the northern extremity of Scotland with the eastern coast of Greenland—being the only portions of land uniting Europe with America. Already, in 1839, the vegetation of the Farøe archipelago had struck me. Though lost in the middle of the Northern Ocean, its Flora was composed of plants very commonly seen, and generally indigenous, on the plains of central Europe, others being found on the Alps of Switzerland, and some in Scotland and Greenland. Extending my researches to Shetland and Iceland, I found in the same manner that these islands had no vegetation proper to themselves, all their plants originating on the continent. A new problem presented itself. Did these vegetable colonies come from Europe or America? As a great number of the plants are common to the northern portions of the new and old world, the question presented some difficulties. Nevertheless, I found more than one hundred species *exclusively* European, all the others being common to Europe and America. A great vegetable migration has crossed England, Scotland, the Orkneys, the Shetlands, the Farøe Isles, and proceeded even to Iceland. Some species have gone direct from the coasts of Norway. But at the same time arctic plants, originating in Greenland, pursued a reverse track across Iceland, the Farøe and Shetland Isles, to the Scotch mountains, where they found a second country. This double migration reveals itself by numbers. If we count the relative proportion of exclusively European plants which enter into the Flora of the Shetlands, we find them amount to a fourth; in the Farøe Isles it is but a seventh; and in Iceland but a tenth. In proportion, then, to the distance from Europe, does the number of vegetable productions proper to that continent diminish; while the Greenland plants increase in pretty much the same ratio.

While agreeing with Mr Forbes in respect to the fact of the colonisation of the islands of the North Sea, the

boldness and novelty of the hypothesis by which he endeavours to explain the fact induces me to feel some hesitation in adopting it; especially as, without interrogating the past condition of the earth, I find a plausible explanation of the transport of seeds in causes actually existing. The great current termed the *Gulf Stream* takes its rise in the Gulf of Mexico, and passing along the shores of North America as high as Newfoundland, traverses the Atlantic, and strikes the western shores of Scotland. This it is which carries there the seeds of Mexico, even still endowed with germinative power, and has cast upon the Hebrides the *Eriocaulon septangulare*, a species of North American origin, and the only one of all the British plants which is not European. Passing the coasts of Scotland, the Gulf Stream collects, so to speak, innumerable seeds which the water-courses have brought down to the ocean, bears them along, and distributes them in the sandy nooks of the various islands. This current appears to me to be the principal agent of the diffusion of the European plants among them. Nor are the winds strangers to the work of dissemination; and whoever has once felt those long and terrible blasts on the northern seas, will no longer doubt their power of transporting such light bodies as seeds from one isle to another. A fact of recent occurrence may be cited in proof of such power. At nine o'clock in the morning of the 2d September 1845 there was an eruption of Mount Hecla; on the 3d, the ashes fell on the most southern of the Farøe group of islands; and the same day they were carried to the Shetlands and Orkneys, and were found on the decks of vessels sailing between England and Ireland. Another mode of transport has been but little attended to; namely, that by migratory waterfowl, millions of which leave the coasts of Spain, France, and England every spring-time for the islands of the Northern Sea, to return the following autumn.

AN ADDRESS TO THE LADIES ON A VERY DELICATE SUBJECT.

To every one of you, ladies, I believe I can say with a safe conscience,

‘I do, as is my duty,
Honour the shadow of your shoe-tye.’

I claim, however, that shoe-tyes, to be honoured, should be seen. At present they are enveloped in such a longitude of skirt as utterly extinguishes them. Every now and then we find you, dear ladies, labouring under some monstrous extravagance of attire, as wide sleeves, arachnoid waists, and so forth. Now the reigning solecism is over-long gowns. It is a case which may almost excite some doubts as to the soundness of the feminine understanding, so entirely does it seem to defy all the ordinary rules of common sense. Ah, gentle dames—but let us look into the matter a little in detail.

See yonder elegant lady moving along the pavement, like ‘Troy’s proud dames, whose garments sweep the ground.’ Very well for the Trojan dames, perhaps, to indulge in such dress in sounding epic; but oh, look at their living imitatrix of modern England! It has been a damp morning, and the flagstones are bespread with a thin paste of mud. Our fine lady’s skirts just skim this soft substance, and behold they are thickly dabbled for a few inches upward with mud, which they have also communicated in no small quantity to the shoes and stockings. She dare not now hold up her skirts to save them from further pollution, because that would expose a state of matters about her feet and ankles at which every other body’s eye would revolt. She therefore walks desperately on, knowing she is always getting worse and worse, yet unable to help herself until she shall reach home, by which time she

will be in a state only fit for the consideration of her maid, to whom I leave her. Is this a reasonable treatment either for silk or mousseline de laine? Is it doing justice to a pair of the neatest feet in the world? Is it right to visit mortal shoes and stockings with such indignity?

Or see the same figure in the same place on another day. It is now dry weather, and what was formerly mud is now dust. The same garments sweep up as much of the volatile as they formerly did of the humid nuisance. It does not clag and barken on skirts and feet, but it goes farther, and produces a worse abomination. The masculine imaginations coming up behind dwell for a moment on the dust-bath in which our Trojan dame is indulging, and its unpleasant consequences. For of what is the dust-bath composed? Alas, we all know what matters mingle with the soil of a crowded carriage thoroughfare. It is as a volunteer scavenger that our lady acts, with this remarkable addition to the usual duties of the class, that she chooses to go home laden like a bee with the materials on which she operates. Nor is it inanimate dust alone. In warm weather, the powder of the street is full of insects visible and invisible. Think of a proud and stately gentlewoman gathering an entomological museum about her as she treads the pavé. How much obliged must several of the better-known parasites be to her friendly skirts for transporting them into new settlements! Some of them will probably make themselves known to her ere long; others she will be spared knowing, but I can assure her they are there nevertheless.

Were there any irresistible elegance in long skirts, I should, dear ladies, have some little sympathy in your submitting, for its sake, to these inconveniences. But the fact is, that while a train is a fine thing in a state-room, a trailing gown is an unpleasant object to look upon in a street. It is so, because it is felt as utterly inappropriate. We cannot admire anything if it grossly shocks rationality. Long skirts, which can only be an inconvenience and a source of defilement in a street, shock rationality: therefore we cannot admire long skirts in walking-dresses. It is the plainest and most incontrovertible syllogism. Skirts which leave the feet free to move without being touched by them, fulfil the common-sense idea of the matter, and are felt to be handsomer accordingly. There is also what I may call a positive or absolute grace in the neatly-shod female feet seen moving smartly along a city way. A woman should not be a purely bell-shaped object, with the edge touching the ground. The feet are required for a basis in the figure; otherwise a painful sense of incompleteness or imperfection possesses us. I am not prepared to advocate the Slavonian brevity of petticoat, with a supplement of frilled trousers: perhaps our habits of feeling forbid the hope of such a fashion ever being introduced. But I would certainly recommend that the skirts of walking-dresses should never come within three inches of the ground, whether with supplements or not.

I hope, fair ladies, that you will not think of calculating against this friendly remonstrance and advice, on any such weak ground as that it is a matter which we men have nothing to do with. The very reverse is the case: you do pay us the compliment of dressing very much to please us. Knowing this, and grateful for it, we feel that it is but the simplest justice to apprise you when, from any misconception on your part, you fail in your amiable design. It is only right that we should endeavour to turn you to modes in which you are more likely to succeed. This is the sum of my wishes at the present moment. I have used strong

terms, because gentle ones would be of no use; but I mean kindly.

You will perhaps tell me that fashion is imperative, and that, till it changes, you are helpless. I know well that this is an influence against which the individual is in a great measure powerless, though I do not well see why any of you should become an entomological cabinet or a walking sample of the soil because another chooses. I aim, however, at affecting that general feeling or sense in which fashions take their rise. It must reside somewhere: the Journal goes everywhere: ergo, I have a good chance of reaching it. The only fear is, that the fashion-instituting power, like some other powers, resides with persons not the most shining in point of judgment, not to speak of taste. In that case, these reasonings will most probably be thrown away. I am, nevertheless, hopeful. The cause of retrenchment of skirts is one which may require agitation, and may not be crowned with speedy success; but it is one founded so clearly in rationality and a just sense of what is beautiful and what is decent, that sooner or later it must triumph. And so, with sentiments of the highest consideration and respect, I bid you, my fair countrywomen, a tender adieu.

J. BALDERSTONE.

POPULAR MEDICAL ERRORS.

THIRD ARTICLE.

Scarlet Fever.—I have heard people remark, in the slightest cases of scarlet fever, that they supposed the disease to be only scarlatina. It may be well just to observe that this supposed distinction between scarlatina and scarlet fever has no scientific foundation, and is simply a popular misunderstanding. Dr Watson has alluded to this notion in his valuable lectures on the 'Practice of Physic,' to which I have already referred. 'I need scarcely,' says he, 'remind you of a sort of mystification which prevails among the public about this complaint, and which many practitioners, for no good reason that I can see, seem disposed to encourage. Mistaking the Latin and scientific name of the disorder for a mere diminutive, you will hear mammas say, "Oh, my children have not got the *scarlet fever*, but only the *scarlatina*." I always disabuse them of this absurd error when the opportunity of doing so occurs. It can produce nothing but confusion, and a disregard of requisite precautions.* There is a distinction, however, in the terms used to distinguish the mild form of the complaint from that in which the throat is implicated, the former being called *scarlatina-simplex*, and the latter *scarlatina-anginosa* (from the Greek word *αγκω*, to strangle). The knowledge that there is such a distinction will of course do much to keep up the error alluded to.

Bleeding—Dark Blood.—It is very common for patients to remark on the colour of the blood removed by the application of leeches. They will say—'It is very well, doctor, that I have been bled, for the blood was very bad—as black as your hat.' The leech-women generally maintain similar views, and the practitioner is perhaps pleased to find a new argument adduced in favour of the steps which he has taken in having his patient bled. Of course there is a real peculiarity in the blood removed from different patients; but the profession are not in the habit, and indeed not capable, of judging in this summary manner by the darkness or lightness of the colour.

The blood removed by leeches has generally the aspect of venous blood; being principally from the minute vessels which form the extreme ramifications of the arteries and veins, and which carry blood of a dark and venous character.

Whilst on the subject of bloodletting, I may mention a fear which exists, that when bleeding has been once performed, it will be requisite to have it repeated

* Op. cit., p. 754, vol. ii.

periodically. If the necessity for bloodletting have arisen from causes which are likely to be permanent, it is true that it may again be necessary to have recurrence to the same treatment; but it is too much to say that the mere fact of taking blood imposes on us the necessity of repeating it periodically.

Again, there is an idea that leeches placed near the eyes weaken the sight. It is very certain that profuse bleedings, which drain the system of blood, and produce extreme palidity, may, and do often occasion, at least a temporary failure of vision; but this is no reason why we should object to a leech or two, as many do, on the ground that their application will weaken the sight.

Lungs Affected.—We often hear people ask whether their lungs are affected. Now, by the term *affected*, they imply something very serious; but the expression is of course a vague one, and may be applied with propriety to derangements of a very slight nature. Carelessness in the use of words is a frequent source of error with the public in respect to medical subjects. A man will tell you he has a disease of his liver, when perhaps it is only a little disordered. The terms disease and disorder have nothing in their etymology to render them peculiarly applicable to one or other condition; but conventionally there is a great difference, disease being mostly applied to actual structural changes in the organ, and disorder to mere disturbances or functional derangements (that is, derangements in the office or function of the part); but this is never known or attended to by the public, and hence very many mistakes.

The term *affected* of course may mean something or nothing. A person in the last stage of consumption has his lungs affected, but so also has every one who has the most trifling cough. Take the common dictionary meaning of the term, and it will do very well for its application to disease—there is nothing different in its appropriation to medical subjects.

Fire got out of Burns.—I never properly knew what people wish us to understand when they say that 'the fire is not got out of burns.' I really imagine some people suppose the fire to have actually entered the part, and to be inside it. This view of course is so absurd, that I will not insult the understanding of the reader by stopping to refute it. If the term be applied to the first or painful and inflammatory stage, it is allowable enough; but as I think it *does* exercise a sort of impression on many that the fire is a something to be *got out*, it would be better that this metaphorical mode of speaking were altogether abandoned. In this, as in many other instances which I have brought forward, it may be well to remark that many of these sayings are happily understood by those who employ them for no more than their true value, and therefore only to be considered as figurative expressions; but I am convinced that there are a very great many who believe them literally, and are more guided by them than by anything which can be said by their professional advisers.

Lungs Completely Gone.—Nothing is more common than to hear people gravely state that their lungs are gone, or almost gone. This may be, unfortunately, to a great extent true in cases of consumption, where the patient is in the last stage of existence—at least if it be meant to say that the healthy structure of the lung is spoiled by disease—death soon following this entire demolition of the pulmonary tissue. The public are, however, by no means content to restrict the term to these fatal examples: a patient will tell us, with all the confidence in the world, that Dr So-and-So has assured him that one of his lungs is entirely gone; or will tell us that a friend of his had one of his lungs quite 'gone' (they like this word *gone*), but set out for the Madeiras, and now is as well as he ever was in his life. Such cases are of course quite untrue. I cannot imagine myself that consumption ever goes on to any great extent in one lung without affecting the other; and certainly if it arrived at a point of complete disorganisation of one lung, the patient could not survive. One lung may

undoubtedly be greatly condensed by pleuritic effusion (altogether, however, unconnected with consumption), and even the side of the chest be contracted, without causing a fatal result; but this is not what is meant by the lung being *gone*, and does not even depend on any disease at all going on in the lung itself.

I think, with respect to this idea of the lung being gone, the profession is itself to blame—many members of it using terms which foster the mistake, or encourage the idea, with a view to increase their own reputation. I have always myself sought to contradict these popular errors wherever I have heard them.

Cinder Tea.—Those who are much acquainted with the diseases of infancy, and have necessarily mixed much with persons who attend upon them, will have frequently heard of cinder tea. To those who have not, the whole subject will appear eminently ridiculous. As I am now, however, speaking of errors which actually prevail, and that to a great extent, amongst almost all classes of society, I care not how ridiculous the subject seems. So long as the errors prevail, the importance of considering them is certain. We are all too apt to measure the value of a subject by its gravity or complexity, rather than by its real influence on mankind and its daily-recurring applicability.

Cinder tea, so far as I have heard of it, is prepared by pouring hot water on cinders taken up from the ashes. What medicinal properties can be imparted to water in this manner I cannot divine, nor indeed how anybody could anticipate good from such a system of proceeding. I remember seeing once in a book of jokes a receipt for making soup from pebbles. You were to put the pebbles into some clean boiling water, and whilst stirring it up, add various savoury articles, and at length a very good pot there would be. But the cinder tea is no such thing: it is to all intents and purposes *cinder tea*. I have heard of a French cook who could make an excellent ragoût of 'de small toot-comb.' The cinder tea would require such a cook to prepare it.

Midwifery.—Great importance is attached by the public to particular days and periods. Now there is, in reality, a curious law of periodicity in the animal world, but the public have not always been happy in hitting upon the real examples, and greatly overdo the point of fact. The ninth day of a confinement is well known to be considered a most important day. The lady may live as she likes on the eighth; but on the ninth, if she does not keep strictly to her bed, it is ten to one if she get well at all. Some rather more reasonably fancy that the nine first days are to be devoted to quietude; and as this reading has some good effect, it is not so very objectionable. However, in reality, the ninth day is of no more importance than the eighth or the tenth, and the particular importance attached to it is only a kind of superstition. In the same way people say that a seven-months' child is more likely to live than an eight-months' child, but they cannot tell you why; and how this idea arose it is difficult to say: a fondness for paradoxes may have had a share in it.*

It would require a treatise to enumerate all the absurd stories which nurses have collected in respect to obstetric medicine.

Of putting the Neck Out and In.—There are few people who have been sporting characters who have not some story to tell about having seen a man put out his neck. They will tell you that no sooner had their friend dislocated his neck, than some skilful fellow stepped forward, and putting one leg on each of his shoulders, set to work, and presently pulled it in again; after which the poor fellow mounted, and rode away as if nothing had happened. With all due deference to our sporting friends, these stories are altogether fabrications. A real dislocation of the neck would be immediately fatal. I once told a person so; but he cut me short by saying he had seen the thing himself. 'The neck was all awry, but a good pull set it to rights.' There is no

* Ramsbotham says this error is as old as Hippocrates.

reasoning against such philosophers, and therefore it is better to attack them in print.

Eyes Washed.—The same kind of people will tell you they have been present at surgical operations where the eyes have been cut out, a skin removed, and then replaced, as if nothing had happened. It is not always easy for a professional man to know how to answer such people. It would be a bore to both parties to enter into a serious refutation of the subject. I may again state that many of the things which I relate as popular notions may seem too absurd for any degree of credulity; but most of what I have said I have heard repeated more than once, and am firmly convinced that it was believed to be true.

We may be disposed to treat common notions as a parcel of silly stories, not deserving the trouble of a serious consideration; but when we find them in practice continually starting up, we are constrained either to join in them or deny them.

Gout.—People say that boils are healthy, or that the gout is healthy; but in these speeches, if they have any meaning at all, there is an elliptical idea. We might say that bleeding was salutary, or rhubarb and magnesia salutary; but then we should presume that there was a state of disease to be corrected. Now, allowing a certain amount of disorder to be actually present, an attack of the gout may be favourable, not because it is good in itself, but because, mischief being actually present, the gout is the means of eliminating the *materies morbi*. In this view of the subject, indeed, many of our diseases might be called healthy. However, we frequently find people congratulating themselves on the gout; or a friend will tell you, if you show him a painful boil, 'That you may thank your stars, inasmuch as it is an indication of full health.' In my own view, neither the gout nor the presence of boils is any proof of good health, but rather a proof of the contrary.

The other day I met a gentleman, who showed me a little boy covered with boils. He said 'he was very glad they were come out, and that they were much better out than in.' In the latter observation I perfectly agreed with him, though, for the poor lad's sake, I could wish that he had never been plagued with them.

Lancing the Gums.—I do not conceive the operation of lancing the gums in children is serviceable merely in facilitating the passage of the teeth, but in relieving the tension and fulness of the part. Surgeons frequently make incisions in parts which are inflamed, without any other object than that of diminishing undue tension. Sometimes it is necessary, therefore, to lance the gums of children when we do not anticipate the immediate protrusion of the teeth. Mothers, however, who like to reason about these things, will occasionally tell us that 'they are not advocates for the lancing of gums.' They will tell us that the parts become harder afterwards, and thus the passage of the teeth is impeded instead of being advanced. This idea is probably derived from seeing the cicatrices of wounds and burns, which certainly often present very hard ridges; but the analogy does not seem to hold good, for I have never myself felt any similar ridge in the gums of children. Besides, however hard these cicatrices may feel to the touch, they do not seem to be in reality very capable of resisting the process of ulceration, or what is called interstitial absorption. Sir Astley Cooper, in his 'Lectures on Surgery,' makes an interesting allusion to Lord Anson's voyage, which has a bearing on this subject. 'Lord Anson's book,' says he, 'is one of the most valuable works which has appeared on nautical subjects; nor is it without its use as illustrative of a principle in surgery. Lord Anson's expedition to the Pacific Ocean was undertaken with a view of destroying the power of Spain in the New World. As he was obliged to sail sooner than he expected, many of the crew which he took out were invalids, some having cicatrices, and others having previously had fractured bones. In his passage round Cape Horn he encount-

tered very severe weather: many ships were obliged to return; some were lost; and the crews of those which succeeded in getting at last to the Isle of Juan Fernandez suffered great hardships. In doubling Cape Horn the crew suffered severely from attacks of the scurvy; and it was remarked by the clergyman, who was an observing man, though he knew nothing of our profession, that the men who had ulcers before were invariably attacked with ulceration in the same parts, and that if their bones had been formerly fractured, they became disunited. . . . There cannot,' continues he, 'be a better example than this for the purpose of showing the readiness with which newly-formed parts ulcerate, as compared with the original structures of the body.*'

THE BRIGHT SIDE.

A TALE.

THERE was once a little boy, his name was Peter Bates. You will say he could not have been a very happy boy, when you hear that he cared for nobody, and nobody cared for him. This is a thing that very seldom happens, as almost every one in the world has somebody to love; and especially when we are young, and our hearts beat warmly, we feel as if we ought to love everybody we know. But it was not so with Peter: his little heart was chilled, until he hardly could tell whether he had such a thing at all; and at last he never even thought of trying; so the fault lay partly in himself, as well as in others. You will think, perhaps, that Peter had no home, no relations, parent, brother, or sister; and yet it was not so, though the place he did hold in his own family made him seem as if he really were alone in the world; for his father, who was a farmer, had married when he was a young man, had two or three sons and daughters, and then his wife died; so he, thinking he should want more money to support so large a family, soon married another woman for whom he did not much care, but who was said to be very rich. This was Peter's mother; her fortune was all a mistake—she had not any; and when her husband found that out, he cared for her less than ever; and then she grew cross, fought with him, scolded his children, and drove away all comfort from the house, until the day Peter was born, when it so happened that she died, and left nobody crying for her but the poor young babe, who, missing her sadly, never ceased wailing until he was sent out to be nursed, that he might no longer disturb the quiet of the house—quiet that, from its long absence, seemed doubly precious now.

And then, in a little while, Peter's father, grown wiser by experience, married another wife, with a smiling face and pleasant ways; and she and her children in time became great favourites with the elder ones, so that, between both, the unpleasant memory of Peter and his mother seemed entirely to have slipped away. But it is not so easy to get rid of disagreeable things; and one day they were all startled into recollection of the past by the arrival of the nurse with Peter, now grown a stout, rude, ungainly boy, so like his mother, that the moment they looked in his face, all their long-forgotten troubles seemed at once to revive. Little welcome was there for him, and he was quick enough to perceive it; in a short time understanding quite well that he was the one too many. So being somewhat shy and proud, instead of trying to overcome their dislike, and make himself pleasing, he grew moody and silent, and kept himself as much as possible out of the way, so that at last he was nearly as much forgotten as before. No one looked for him as part of the family group; and if by chance he did linger a moment after meals, or draw in his seat by the fire, he was stared at as an intruder, and made to feel that his rough manners and uncouth appearance unfitted him even for the society of his own family. It was a trying position: and yet we can all think of some bright loving child,

* Astley Cooper's Lectures on Surgery (small edit.), p. 59.

who would have won his way to their hearts in spite of it all; who would have shown a wish to oblige, or a wish to be loved; and whose smiles and winning words would have made friends by themselves alone. But not so with Peter: he had his mother's disposition, as well as her features, and no one had ever tried to work improvement in either: no one softened his proud little heart with a kind indulgent word; no gentle hand smoothed down his curls or tidied his dress, taking pleasure and pride in seeing him behave and look well; and so, left to himself, and brooding over the contrast between himself and others, Peter became more and more surly and awkward each day; until at last he was considered as a sort of fool, and employed in nothing else but watching the sheep or the geese as they picked up a few blades of fresh grass by the side of a road that passed within some fields of his father's house.

But if Peter cared for no person, it might have been known he had some feeling by the love he showed for one thing, and that was his dog Snap. This animal being rough and ugly like himself, they were truly a well-matched pair. Snap was just as much despised in the family as his owner; but he was quick and intelligent enough in his own way, and did his business well: he kept the cattle and the geese within proper bounds, watching them with his quick eyes, while he nestled at his master's feet, thereby keeping them warm. Best of all, he kept all intruders aloof, and often gave poor misanthropical Peter the gratification of seeing some more prosperous urchin, who might otherwise have flaunted before him, take himself off in double-quick time at the sound of Mr Snap's growl, or still more menacing bark.

It so happened one day that Peter, sitting as usual by the roadside with his dog on his feet, saw him prick up his ears, and look down the hill towards a spot where the road went out of sight. 'Some sport coming now,' thought Peter to himself; and laying his hand on Snap's rough coat, he held him in readiness to bound off at the proper moment and attack the new-comer, Peter all the while sitting gruffly by, as if he had neither hand nor act in the business; but even while he waited, his hand involuntarily pressed Snap more firmly down, and a faint gleam of pleasure flitted across the sullen face. No wonder—even Snap laid down his head quietly between his paws, and the ears which had been pricked up so fiercely, drooped softly over his face again, as they caught the pleasant sound of a young happy voice, singing some sweet old tune without any words, without beginning or end, but going backwards and forwards on the notes in unthinking glee. Presently the singer appeared at the turn of the road, now advancing, now stopping, now stooping down as she sought for the first violets that ventured to peep through the still wintry air. It was a fair little girl, not much older, and hardly as tall as Peter himself; but oh what a contrast to him was her bright young face as she now raised it up glowing with delight at discovering one more blossom, which she added to a little bunch already within a tiny basket on her arm! and then, as if determined not to loiter any more, advanced steadily up the hill.

As she approached, Snap, yielding to old habit, in spite of Peter's restraining hand, jumped up and uttered his growl; but this time, instead of his usual tacit encouragement, his master really held him back, and in tones almost as rough as those of the dog, called out to the little girl, 'Never fear: stand your ground, and he'll let you alone.'

'Why should I fear? Why should I run?' said the little one smilingly; and with one step she placed herself quite close to Snap, with her hand on his rough coat, he looking up with eyes half closed, from which all anger was banished, and even condescending slightly to wag his tail.

'Why should you run?' said Peter, echoing her question with some wonder. 'Every one does: every one,' added he with some pride, 'is afraid of Snap.'

'Then I am not afraid of him, or of anything else,' replied the little girl laughingly, and presenting a piece of bun from her basket to the dog. 'So Snap is his name. Well, good-by, Snap: the next time we meet we shall be better friends.' And away she tripped, once or twice looking back and waving her hand, as she repeated 'Good-by, Snap; good-by,' until the hawthorns, closing at another turn of the road, shut her out from their view.

There is an old English poet—he lived three hundred years ago, and so it is hard enough to read his old-fashioned verse—but he tells, in a poem called 'The Faëry Queen,' of a fair girl named Una, whose gentleness and sweet looks actually tamed a lion that she encountered one day wandering alone in a forest, and won on his wild nature so much, that he followed her about, and became her protector, until she found her way back to her friends. Now, as nature remains just the same, in spite of all the changes of the world, it was just in this way that the little girl we are telling of, by her fearless gentleness and good-humour, won not only on quarrelsome Snap—so that, when she passed on, he slapped his tail quite vehemently against the ground in token of his approbation—but also on his surly little master; both Peter and his dog feeling a sort of inward satisfaction at the little occurrence, which made one of them at least hope it might happen the next day again. Poor Peter! pleasant words and pleasant looks were a novelty to him, and he felt for the moment somehow as if the sun had shone out suddenly from behind a cloud.

The first time for many a day he thought a little about the future—a short future to be sure: it was only, 'Would that little girl come to-morrow?' Yet still it redeemed his mind from its usual dreary blank. But before the morrow came, fresh misfortune awaited Peter: true to his training, Snap soon forgot his softer feelings, and when the next wayfarer passed by, fierce, fiercer than ever, as if to make amends for his late forbearance, he growled, he barked, he sprang upon the traveller, and going even farther than usual, at last caught him by the leg. He was rewarded by a blow of a stick, which sent him stunned and sprawling back to his master's feet, who, now roused out of his assumed apathy, at once took his part, and in fiery indignation assailed the stranger himself. He, disdaining to punish the boy as he had done the dog, took him by the collar, in spite of a stout resistance, and leading him up to his father's house, delivered him to the authorities there. Unluckily, or rather luckily for Peter, his father was on the spot, and due punishment followed, though the good-natured stepmother would have begged him off on the plea of his being half a fool.

'Foolish enough to be mischievous at anyrate,' said his father, as he sent him off to his usual occupation the next morning, locking up Snap in solitary confinement, with the declaration that before evening he should certainly be hanged.

Peter had no language for remonstrance; he knew nothing of persuasion; and so in a temper more moody, more hopeless, more savage than ever, he took his now solitary seat by the roadside, missing the warmth as well as the society of his dumb companion, and shivering as much with grief and anger as with cold, until at last he burst into a fit of crying, very unusual with him, who knew nothing of sympathy, the spring of half the tears we shed. He had bowed down his head between his knees in this miserable state, when again, as yesterday, he heard the sweet song, the light step, draw nearer and nearer: he knew it was the little girl, but this time he could take no pleasure in anything; he was angry and ashamed, and so he determined he would let her pass on, and never raise his head.

But it would not do: the footsteps paused quite close to him, the sweet voice, no longer merry, but oh how gentle! inquired what was the matter. And then the little hand was laid on his shoulder, even as it had rested on poor Snap's shaggy coat the day before, and

in spite of himself Peter was obliged to look up. He knew what an ugly, wo-begone, forbidding face he must have; but he read no dislike in the compassionate one that was now bent over him; on the contrary, there was something like tears in the sweet blue eyes, as she again said, 'What can be the matter? And where is Snap?'

Poor Peter was quite upset at this question: he could not answer it; and so taking up the trouble that pressed at the moment, he contented himself with muttering, 'I'm so cold!'

'And so you are, poor fellow!' said the little girl kindly. 'But no wonder, when you are sitting here on the frosty side of the hedge. Look how the sun shines over there: come across to the bright side, and you will feel yourself cheered even before you are warmed with its heat.' And whether he would or no, she gently forced him from the chill seat on which he had sunk in the carelessness of grief, and made him settle himself comfortably on the sunny bank at the opposite side of the way.

'And now what is the matter?' she asked for the third time. 'I am sure there was something more than the cold.' And Peter, who had never before confessed a trouble to any one, found himself relating all his griefs to the little stranger whom he had never even seen till the day before. She laughed—she could not help it—at his account of Snap's encounter with the traveller; and the more rueful and serious Peter looked, the more it still made her laugh, until he came to the close of the adventure, and then she looked very grave, and readily allowed that the punishment, and, above all, the hanging, was no laughing matter indeed.

'But, Peter, though you say your father is very stern, still I wonder you did not try to beg off poor Snap; as you were punished yourself, and bore it well, maybe for your sake Snap would be forgiven if you tried. Did you try?'

'No, indeed; it would be of no use: I never asked my father for anything. They say I am a fool!' And poor Peter, in deep consciousness of his degradation, again buried his burning face between his knees.

'A fool!' repeated the little girl, and her blue eyes opened very wide. 'Oh, Peter, you surely are not that? Do not let any one think so. Go to your father, like a sensible boy, and tell him you are sorry for what happened—as you ought to be—and that you will promise for Snap that he shall not get into any more mischief. You know, Peter, you *can* promise that;' and again the bright eyes laughed gaily, while a dawning smile flitted over Peter's doleful features too. 'And now I can stay no longer, otherwise I shall be late for school; so good-by, Peter: do what I tell you, and be happy to-morrow.' And again the little one tripped away, turning again, and waving her hand until the bushes shut her out. But this time it was 'Good-by, Peter,' instead of 'Good-by, Snap.'

Peter remained lost in a world of wonder and perplexity at the new line of conduct proposed to him. Should he, could he follow it; had he any chance of being listened to? No, it could be of no use—he never could do it. Thus was he deciding, when again the sound of light footsteps made him turn his head, and in a moment the little girl stood breathless by his side, with her hand on her heart, to still its beating, but smiling all the time, as she waited impatiently for words. At last she exclaimed, 'Oh, I ran so fast! Just as I got to the top of the hill, I thought of one thing I wished to say; and I am so late; but I should tell you this: when you go to ask your father, Peter, do not hang your head, and look down as I have seen you do; maybe it is that makes him say you are like a fool; but look up in his face as if you trusted him, and were not afraid of him, or ashamed of what you asked for; and remember to say you are sorry, and promise for the future; and, that's all—remember now.' And before he could answer a word, she was again out of sight.

Her words just turned the scale; Peter manfully went through the ordeal, and succeeded; he even overheard his father say to his wife, as he turned away, 'That boy is not such a fool after all;' and he certainly looked a different being, sitting on the sunny bank with Snap by his side, on the following morning when his little counsellor came up.

And thus passed many a day—a short five minutes—giving food for thought, hope, and dreams for the rest of the twenty-four hours, to one whose mind had seldom strayed beyond the passing moment before: with habitual reserve, he never spoke of this acquaintance to any one: it was a treasure he could not bear to exhibit or share; indeed he had his own mysterious notions about it; and although not versed in fairy lore, he felt always a latent fear that something might break the spell; and when, in compassion to his poor chilled hands, the little girl brought him one day a pair of woollen mittens of her own knitting, and made him put them on, he carefully took them off in the evening when he was returning home, laying them by in a house six inches square, which he had employed himself during the day in building for them, in a hidden spot, with four well-fitting stones, and a flat one for the roof: there he always kept them when not on his hands—the secret was too precious to be carried over the threshold of a home occupied by any one else.

Each day, as spring advanced, the little girl's delight in the wild flowers grew more and more intense; now a garland of hawthorn, now a spray of honeysuckle, now a wreath of wild roses, called forth her admiration.

'Oh, are they not beautiful—beautiful!' she would exclaim.

'But they are so common; they are everywhere,' would be Peter's answer. 'I am always looking at them, yet I never noticed them before.'

'And are there not a thousand common, beautiful things, on every side of us, Peter, if we would only open our eyes. Thinking of them, and enjoying them, we need never feel lonely or gloomy. Do you remember that sorrowful day when you shut yourself up in misery from within and without, and all the sunshine going for nothing within a few steps of you, you had only to come over to the bright side, and all was well? Do you remember that, Peter? Well, there is a little sentence here that always reminds me of that day; see, here it is, "hope is the sunshine of the heart;" and pointing to the line as she found it out in one of her little books, she put it into Peter's hand. In a moment his brow grew scarlet, and he hung down his head; then remembering her advice, he looked up again, and with an effort at manliness, which showed the progress he had made, he ingenuously said, 'It is of no use; I cannot read: I never learned; no one ever taught me.'

Even before he spoke the little one guessed how it was, and she, too, had blushed deeply, painfully. But the sentence was hardly finished, when she hastened to exclaim, 'Oh, is that all; I was afraid it was—couldn't, or wouldn't—you shan't have that story to tell again. See, here is A, here is B; repeat them after me;' and as her musical ear caught the accidental rhyme, she laughed so joyously, echoing it again and again, that even Peter caught the infection, and joining in her mirth, they both laughed the little embarrassment away.

They went on with four or five letters; but then she closed the book, and more seriously said, 'Peter, this will never do; I have no more time; I must not loiter; and you must no longer stay in ignorance; you must ask your father to send you to school.'

It was now Peter's turn to open his eyes in unutterable astonishment; such a presumptuous thought had never once entered his head; he had never made any request of his father but one, and that under the prompting of superior intelligence; and now he could not even hope that he should be listened to again; in fact he even feared to mention such a boon.

But his little companion combated all his objections,

and, his spirit already roused by the shame he had just endured, it was settled at last that if he found himself successful in learning the alphabet under her teaching in a few days, with that as his groundwork he would make the trial. His lesson was marked out for that day; she spared him a little book, and to their mutual delight, in three days more he was perfect in all the letters. This success gave him some confidence; and, summoning his whole stock of courage, he accosted his father the following morning with a request that he might be sent to school.

'To school, boy! for what?—to idle, is it?' said his father, stopping short, and eyeing him from head to foot.

'No, father,' replied Peter resolutely; 'it is to learn. Try me at any rate. I know my letters now, and I would wish to get on.'

'Your letters! A great stretch indeed, for, let me see, nine years old.'

Poor Peter felt his heart swelling; but here his step-mother interposed—'And more shame for us to have him nine years in ignorance, if he was able to learn; and it *was* a great stretch for you, Peter, my little man, to learn your letters; you may well be proud of it; who knows but you may be a credit to us yet?'

Peter's look of grateful astonishment at the kind word went to both their hearts: his father patted him on the head, and told him it should be as he wished; and from that moment forward he seemed to enter on a new existence. He respected himself, and others soon learned to respect him also; while, in the new turn of feeling, every one tried to find some good quality in Peter never suspected before: his heart and his mind, both so long left in fallow, now were ready to yield a tenfold crop; and while he gained the regards of his playmates, his master, before many months, pronounced him one of the most painstaking and improving boys in the school.

What pride he would have felt in reporting his progress to his first little friend, as each day he went down the hill to their old place of meeting, and placing his four-footed or feathered charge under the guidance of Snap during the hours spent at school, loitered and watched in the vain hope of seeing her, if it were but for a moment. But she came not. After the first day when he related his triumph, and she shared in his joy, pouring a flood of courage and hope into his mind, he saw her no more; and the long summer waxed and waned, finding him still each morning on the same spot, returning ever with drooping head and disappointed heart. At last one day—it was late in autumn—joy of joy, he saw her coming slowly up the hill! Snap, with a quick cry, bounded to meet her, and for once Peter felt almost sorry that he should reach her first; but though she looked smiling and bright as ever—brighter even—she did not say one word in answer to all Peter's words of welcome, until she reached the little sunny spot where they were always used to sit; and even then she pressed her hand tightly on her side, as she had done on that long-ago day, and drew her breath quickly, though she had been walking very slow. 'Yes, it is a long time, Peter,' she said at last, in answer to all his questions—'a long time since I was even out, for I have been very ill; but to-day was so fine, that I was allowed once more to go and see a friend I love—that dear schoolmistress, for whom you have plucked so many nosegays.'

'No, indeed, they were not for her,' exclaimed Peter bluntly; 'they were always for yourself.' The little girl laughed one of her old blithe laughs; but then she put her hand to her side again, and Peter said quickly, as if to contradict his own thought, 'You are not sick now? sick people are always pale.'

She smiled somewhat sadly, and laid her hand on his. It was always a little hand, but now it looked so small and thin, that the blue veins showed themselves quite plainly through. Peter thought it prettier than ever; but still there was something in her look, and in

the little action itself, that raised a choking feeling in his throat which prevented his saying one word. After a moment's silence, she arose, and taking a book out of her basket—it was her little Bible—she said, 'You will keep this for my sake, Peter, and read it often: I am so glad you can read it now. I cannot stay longer, lest I should catch fresh cold; but whether we meet soon again or never, you will still remember me; and remember, too, what I always told you—in everything that pains or troubles us there is some bright side.'

She looked upwards as she spoke, and there was a strange beauty in her face which awed and silenced Peter. He bowed his head between his knees, to hide his emotion: when he raised it again, she was gone.

From that day forth, though each morning found him at the trysting-place, it was more to read a little portion of the book she had given him than with any sanguine expectation of seeing her again. And always when he turned away from his long-searching gaze down the valley, he used to raise his eyes to the blue sky and fleecy clouds, and feel as if the true answer was there. And then he bethought him how he had never asked her name, where she came from, or where she was going, but watched for her as he did for the morning sun, and saw her even like that, passing on day after day, and never returning back; and thus at last she became so identified with bright and beautiful nature in his simple mind, that he almost doubted whether she had been a reality at all. He kept her precious gift, even as he had done the first one, in the little stone-house, now carefully stopped with moss and clay, to preserve it from damp. But notwithstanding all his precautions, he perceived a spot one day on the cover; and the fear of injury to it being even stronger than the fear of discovery, he brought it home, at what he thought a quiet hour, to air it by the fire. But Peter had not yet learned to estimate female curiosity: a little sister, who had become a favourite of his, from a slight fancied likeness to his early friend, was hovering near; and peeping over his shoulder to see what he had got, did what Peter, long as he had the book, had never thought of doing—she turned the leaves over to the title-page, and there discovered the giver's name.

'Jane Watson!' repeated she, first aloud, then slowly to herself—'Jane Watson! why, that was the name of Mrs Bonar's grandchild; that sweet little girl, that every one said was too lovely, too wise, and too good to stay in this world!'

'And is she in it now?' asked Peter nervously.

'Ah, no—they spoke too truly—she died last Christmas-day! When we gathered back to school, the best and fairest was gone. But why do you ask so anxiously, Peter? And where did you get this book? Did you ever know anything about her?'

Prepared as he had been, the certainty was almost too much for Peter, to find out all about her only to know that he had surely lost her. But then recalling her last words, and remembering how much there was connected with their brief acquaintance that could never be lost to him, he gave his best tribute to her memory in the effort with which he conquered his emotion; in the smile, even though it was a sad one, with which he answered his sister's still questioning looks, as he calmly said, 'Yes, Letty, I *was* so happy. I knew her once, and am happier still that she knew me.'

SUNDAY IN GLASGOW.

Thirty-nine abstainers accomplished a moral survey of the city of Glasgow on the 29th October, being the communion Sabbath. The object of the survey was to ascertain the number of whisky-shops open for the sale of intoxicating liquors. The survey was made between the hours of six and ten in the evening. The result is the fact, which we now advisedly publish, that *one thousand and ninety-seven public-houses were open!* If a baker were to open his shop, a posse of policemen would be sent to shut it; and if the offence were repeated, the baker would be dragged before the authorities, and severely fined. The

day is too sacred to be desecrated by the sale of bread. But whisky, it appears, may be sold in a thousand shops on the Sabbath-day without profanation. The dignity of Sunday, it seems, requires that food should be withheld; but it is not at all marred by the sale of poison. The people may not buy what may do them good on Sunday, but may have a liberal supply of what must do them harm. Virtue must starve on the sacred day if it forgets to buy its loaf on the Saturday; but vice is better cared for—it receives its appropriate aliment on that day as on others. The occupations that clothe, lodge, and educate the nation, must cease one whole day in seven; but the occupation that covers the masses with rags, that doles to them as poison what the baker should have handed as food, that drives them out of comfortable homes into wretched warrens, that dooms their children to ignorance and beggary—this occupation never ceases in the city of Glasgow. The baker, the butcher, and the grocer must stop, but the publican never. Our legislators (we have much to thank them for) have carefully closed the wells of physical health on the Sabbath, and have, with a wisdom too deep for common minds to appreciate, thrown open the sluices of crime, pauperism, and disease. Railway travelling, though a tolerably good mode of Sabbath desecration, is a mere bagatelle compared with opening the whisky-shops on Sundays. Ten hundred and ninety-seven whisky-shops, containing ten customers each, is equal to a train with ten thousand nine hundred and seventy passengers! But the dram-shops could easily accommodate ten times the number.—*Scottish Temperance Review.*

THE HEDGEHOG.

Begging pardon of naturalists for such an accusation, I can't help saying that I think a great many fibs have been told about the hedgehog. In the first place, the old wives' fables about sucking cows, and so forth, were so horribly unbelievable, and yet so damaging to little hoggy's reputation with the vulgar, that the more erudite and more humane became his patrons and apologists, and made much more of him than he deserves. Dear old White of Selborne must have been taking a nap when he told us about hoggy's liking for plantain-roots. 'The manner,' says White, 'in which hedgehogs eat the roots of the plantain in my grass walks is very curious: with their upper mandible, which is much longer than their lower, they bore under the plant, and so eat the root off upwards, leaving the tuft of leaves untouched. In this respect they are very serviceable, as they destroy a very troublesome weed.' Boy and man this passage tormented me many years, because I knew hoggy to be a bloodthirsty poacher, a regular knight-errant for attacking vipers, and a tyrant over all manner of mice and such small deer, and I thought it passing strange that he should take to cooling his copper with the roots of the old gentleman's plantains. However, the tastes of pigs and men are every now and then somewhat eccentric, so I left the matter *sub judice*, until chance solved the mystery. In a grass walk I saw some flattened plants of the common plantain withering and half dead; by the side of each I found the hole, bored, as White supposed, by the long upper mandible of the hoggy; but it was scarcely big enough to admit a lead pencil, and so round and smooth, that I said directly to myself, 'Tis the burrow of a night-eating caterpillar.' I got a trowel, and in a trice the fellow was unearthed, and he afterwards turned to a ghost-moth, or yellow underwing, I can't say which, for both came out in one cage. The hedgehog is properly a nocturnal carnivorous animal; he prowls about at night, like an owl, looking after the nests of pheasants, partridges, cornebrakes, and larks: he kills the old ones if he can, and sucks their eggs if he can't; now and then he overruns a rabbit; but his favourite dish is a snake or an adder—he catches these while dozing under cover, and suffering from repletion caused by four or five mice lying undigested in their stomachs, tail on, and it is then that desperate fights ensue: it is then that his armour stands hoggy in good stead: the deadly adder, infuriated at feeling hoggy's teeth gripping her back, lashes her head against a skin less vulnerable than that once said to have been worn by a Mr Achilles. The pluck and power of both are tried to the utmost; but hoggy is almost sure to triumph in the end, and the adder, half devoured, is often found next morning by the countryman, who wonders 'how he come so mauled.' I take it that the spiny coat of the hedgehog is nature's defence against the poison fangs of his favourite prey.—*Letters of Rusticus.*

SONG OF THE FORSAKEN MAID.

I.

OH weel I mind! The sun flung bright
Upon the wave his trembling flame;
The birds sang luve frae howe and heicht,
And ane was by I daurna name.
The fields are mute, the sangsters flown,
The leaves hae left the silent tree,
In haste awa the spring has stown,
And my fause luve's forsaken me.

II.

Forgotten is that gentle strain,
Sae luved and lost; without regret
The wave in darkness sleeps again,
And why maun I remember yet?
Oh gin that lesson I could wrest
Frae thy cauld heart, thou darksome sea!
And whare suld I sae saftly rest,
Sin' my fause luve's forgotten me?

L. R.

MORAL WITHOUT PHYSICAL COURAGE.

Lieutenant W— was at the storming of Morne Fortunée in the West Indies. His behaviour on that occasion excited general admiration. He was the first to ascend the breach and plant the king's colours on the captured redoubt. His gallantry was recorded in the orderly book, and he was recommended for immediate promotion. Strange to say, the following morning he waited on his commanding-officer, then Lieutenant-Colonel V—d—r, and requested leave of absence to return to Ireland, his native country, and to resign his commission in favour of a younger brother, who was desirous of entering the service. The colonel, surprised at this extraordinary request on the part of a young officer with such bright prospects before him, very naturally asked him what motive induced him to make so singular a proposal; when the young man frankly told him that, when the troops were moving forward for the attack, and the enemy's fire had opened upon them, he felt a strong, almost an insurmountable disposition to fall out; and he believed that nothing but the rapidity of the advance, and the shouts of the men, prevented him from disgracing himself; but after a short time, he added, his brain was on fire, he knew not where he was, and he found himself on the summit of the breach, with the colours in his hand, he knew not how; but he added, not without hesitation, that he felt that the profession of arms was not his vocation; and fearing that at some future period he might not have sufficient courage to overcome his fear, he was desirous to leave the service with honour while it was still in his power.—*Dr Millingen's 'Mind and Matter.'*

THE ATMOSPHERE.

It is only the girdling and encircling air, which flows above and around all, that makes the 'whole world kin.' The carbonic acid, with which our breathing fills the air, to-morrow will be spreading north and south, and striving to make the tour of the world. The date-trees that grow round the fountains of the Nile will drink it in by their leaves; the cedars of Lebanon will take of it to add to their stature; the cocoa-nuts of Tahiti will grow riper upon it; and the palms and bananas of Japan will change it into flowers. The oxygen we are breathing was distilled for us some short time ago by the magnolias of the Susquehanna and the great trees that skirt the Orinoco and the Amazon. The giant rhododendrons of the Himalayas contributed to it, the roses and myrtles of Cashmere, the cinnamon-trees of Ceylon, and forests older than the flood, buried deep in the heart of Africa, far behind the mountains of the moon. The rain which we see descending was thawed for us out of icebergs which have watched the polar star for ages; and lotus lilies have sucked up from the Nile, and exhaled as vapour, snows that are lying on the tops of the Alps.—*British Quarterly.*

RETURN OF PILGRIMS FROM MECCA.

TOWARDS the end of last January, I was sitting in a shop in one of the principal streets of Cairo, watching, for want of better employment, the fluctuating stream of turbans and tarbooshes, that stretched on both hands as far as the eye could reach, when first a distant murmur, then a loud buzz of voices, and presently a shout, a roar, came rolling up the narrow thoroughfare. Some very gratifying intelligence was evidently passing from mouth to mouth. Buying and selling were suspended at once: the conclusion of many a bargain was adjourned: both dealers and customers rose to their feet. And now three men, mounted on dromedaries, made their appearance, moving swiftly down the street: I soon heard them announcing that the caravan of pilgrims from Mecca had arrived at Suez. As messengers of glad tidings, they had pushed on in order to bring letters from those who had survived the privations and dangers of the journey. Long after these men had passed on their way to the citadel, the greatest excitement and agitation continued. In a few hours most of the inhabitants of Cairo were to learn or infer the fate of relations or friends who had been absent for months, and who had either perished in the desert, or were returning, crowned with glory, and encircled by respect, to their homes.

Islamism boasts of many institutions admirably adapted for maintaining its character of unity; and the pilgrimage to Mecca is one of the chief among these. Every year, from every part of the Mohammedan world, a number of men, of all ranks and conditions, repair to the spot where the faith they profess took its rise, and amidst scenes, invested in their eyes with the most sacred associations, work themselves up into a state of enthusiastic devotion, to which perhaps they could never rise under ordinary circumstances. They must arrive at the Holy City in a frame of mind peculiarly susceptible of strong impressions. They have in general encountered great perils by land or sea during the journey: some of them have passed whole months in the horrid solitudes of the desert, exposed to hunger and thirst, fatigue and danger, and kept constantly in mind of the uncertainty of things here below by the deaths which must frequently occur amongst large bodies of men traversing those desolate regions, which no doubt seem to them to have been purposely thrown across the path of the pilgrim to test his zeal, and enhance the merit of his undertaking. Once at Mecca, everything contributes to enhance his enthusiasm; and the consciousness that he has earned the good-will of men—that he will be looked upon with respect and veneration in his own country when he returns—that his influence will be enlarged, and his station exalted—is perhaps equally active with the belief that he has deserved a place in

Paradise, and an unlimited enjoyment of all those pleasures which are promised in a future state of existence to the true believer.

The annual dispersion of men with faith thus invigorated, over the Mohammedan world, must produce a powerful effect. If the pilgrimage were abolished, by general consent, the votaries of the prophet would soon diminish. The tribes and nations who, like the Bedouins, neglect this duty, are far less bigotted, far more indifferent, than those who practise it with unswerving constancy. But it does not seem that the pilgrims derive any considerable enlightenment from their travels. Their object is not to get rid of their prejudices, but to strengthen them. It is true they mingle trade with devotion, and contrive to amass worldly wealth whilst increasing their claims upon heaven. As traders, they come in contact with the inhabitants of the regions they traverse; nevertheless they seem to return home with more confused notions than ever of geography, history, and manners. All they care about is collecting marvellous stories, wherewith to astound their less adventurous countrymen.

When the hubbub had subsided, I entered into conversation with the shopkeeper on the subject of the pilgrimage, on which he had great pleasure in talking. As usual with Moslems, my friend avoided any allusion to the religious part of the procession, as not likely to interest me, and dwelt only on what may be called the secular view. He told me that the chief courier, whom I had seen pass, made a good thing of his trip; it being his privilege to bear the news to the pacha, and the great officers of the court, as well as to all people of position. Every visit he makes produces a present. As to the large packet of letters he carries addressed to minor people, he sells them at so much a hundred to any speculative men who may undertake to distribute them on the chance of a reward.

It is customary for the walls round the doorways and shop-fronts of the pilgrims who return in safety to be painted in bright colours with all sorts of fantastic figures, of flowers, animals, and even men, despite the prohibition of the prophet. It is common now to see steamboats among these representations, which are supposed to indicate the extraordinary objects witnessed by the returning traveller during his absence. There is a good deal of competition among the rude decorators, each seeming to vie with the other in producing the most fantastic and uncouth designs. They succeed at any rate in giving a lively aspect to many of the streets.

Though many of the pilgrims leave their last camping-ground almost immediately on their arrival, and effect their entry at night, the great body wait till morning. I went out a little after sunrise, and found the streets already completely occupied by the procession. It was an animating scene. Immense crowds of people, in holiday

costume, were pouring towards all the eastern gates; some merely as spectators, others to meet their long-expected friends or relatives. Every now and then numbers of men bearing flags, or a band of music energetically playing, would pass, on their way to greet some particular pilgrim; whilst the uninterrupted line of camels, bearing gaudy litters of every description, slowly made its way in an opposite direction. On issuing from the Gate of Victory, I obtained a splendid view over the country. To the left were suburbs and palm-groves, in front was the desert, to the right rose the Red Mountain and the precipitous sides of Mokattam. The procession, with which an immense number of banner-bearers mingled, had divided into three or four columns, each directing itself towards one of the gates; whilst the intermediate spaces, and the slopes of the mounds that rose here and there, were filled up by groups of men and women, many of them evidently on the look-out for some well-known face. It frequently happens that the returning pilgrim neglects to write, and therefore, unless positive information has been received to the contrary, his family always goes out to meet him. Disappointment often awaits it; and every now and then, as I proceeded, I could hear shrill shrieks of sorrow rising in various directions. The women, on receiving intelligence of the death of a relative, return with loud wailings towards the city, tearing their clothes, and exhibiting other signs of grief; in strange contrast with the boisterous merriment, the exuberant delight of others. It is a curious picture of human life, with all its bustle and all its vicissitudes; all its triumphs and all its disappointments, its splendours and its miseries, its joys and its anguish. The drums, and the tambourines, and the pipes, the singing and the shouting, in vain competed with the voice of lamentation, which ever and anon pierced the air, and told how many hearts were ready to break amidst that scene of gaiety and rejoicing!

There was little variety to be observed in the procession. After I had seen forty or fifty camels go by, every one that passed was a counterpart of one that had preceded. The litters, which often hold several people, are in general either square or arched, and supported on two large trunks made fast to the animal's sides. Some few of the wealthier people had *tachterwans* carried by two camels; one in front, the other behind. A great many women were to be observed peeping forth from these litters; which, as I have intimated, are commonly very gaudy, being covered with red, yellow, or blue cloth. Several of the pilgrims rode on asses, which were often stained with *henna*, as were indeed numbers of the camels, in order to show that they had been to Mecca.

I found the emir, or chief of the caravan, encamped at the Haswah, along with the escort of four hundred irregular Arnaut cavalry, sent by the pacha. The tents scattered here and there, the horses picketed close at hand, the long spears, ornamented near the top with great tufts of wool stuck up near them, the savage-looking Arnauts lolling about, produced altogether a very picturesque effect. The Haswah is a place situated in the desert about a mile and a-half north-east of Cairo. Several fine ruined mausolea dot its surface; and in the distance may be seen, over the undulating ground, the summits of those still splendid buildings called the Tombs of the Caliphs. On a little mound near the emir's tent was the mahmal, some account of which I may as well give at once.

The mahmal is an emblem of sovereign power, a representative of the government of Egypt, which every year, therefore, is supposed to make the pilgrimage to Mecca. Six hundred years ago, Sultan Saleh, surnamed The Light of Faith, married Fatmeh, a beautiful Circassian slave, who, on his death, and that of his son, succeeded in ascending the throne of Egypt, and reigned with great magnificence and glory. In order to add a new prestige to her name, she resolved to perform the pilgrimage to the Holy City, and for this purpose caused a litter of a new form to be constructed. Her journey

was performed in safety, and she returned with a character of sanctity. To commemorate this event, every successive year she sent her empty litter with the caravan. Those who followed her upon the throne imitated her example; and at length the mahmal became a necessary adjunct to the pilgrimage. It is now esteemed quite a sacred object, and those who cannot visit the Kaaba itself are almost compensated by touching the mahmal on its return, and gazing at the representation of the holy place embroidered on its front.

A small company of the pacha's regular infantry were placed as a guard over the litter, which was covered with a rough cloth. It was nearly square, with a pyramidal top; and even when I saw it uncovered the next day, presented a very mean appearance. The frame was of common wood, and inside I saw an old box. With surprising toleration, the soldiers on guard allowed us to approach quite near, and even lifted up the cover that we might see the interior. I asked what the box contained, and received an evasive answer; but it was opened for us to look in. I could distinguish nothing but something like a carpet, possibly a piece of the *hiswah*, or covering of the Kaaba (with which the mahmal is often confounded by travellers), or perhaps the *bur'o*, or veil sent to hang before the door. The latter supposition is founded on a fact mentioned by the most correct writer on Egyptian manners—namely, that the custom of sending the veil originated with the same queen who instituted the ceremony of the mahmal, and that the people call it the veil of Our Lady Fatmeh. I am aware that the same writer states that the litter contains nothing; but when he went to see it, bigotry was very strong, and to look inside was out of the question. A French artist, who went with me, was allowed even to make a sketch of it. This was on the second day, when the outer covering was removed, and immense crowds were gathering round, and working themselves up into a state of religious enthusiasm.

There being nothing more to see, I returned slowly towards the city. On my way I observed a crowd collected round one of the ruined mausolea, and alighting, pushed my way in. I found that an old gentleman had selected with great good taste the splendid dome as a protection for his *hareem*; and the crowd around was composed of his friends and relatives, waiting with music and banners to conduct him in triumph to his home. Luckily the ladies were in the act of mounting their donkeys, and the old gentleman had bestridden his mule, before my presence, so great was the excitement, attracted any attention. I was then good-humouredly informed that I had committed an indiscretion, and requested to withdraw, which I did with divers apologies.

On entering the gate, I found the streets still crowded with spectators and the remnant of the procession. Every shop was shut, and on all possible places women and children were crowded to see the sight. Presently a tremendous din of drums and hautboys was heard approaching from behind, and an immense mass of excited Moslems came rushing in various directions; so that I was thrust up into a corner, and very nearly knocked down and trampled under foot. It turned out that a pilgrim of especial sanctity—a great sheik—was making his triumphal entry, surrounded by a huge band of bigots, waving broad red and green banners, shouting, and drumming, and piping. Every one seemed anxious to see this man pass; and the affluence of spectators was so great in the narrow crooked street, that the procession was compelled to stop at every few steps. This was the only occasion on which anything like the intolerance for which Moslems are so famous was exhibited. A single stone was flung at me, and struck me in the side; but several bystanders, who saw what happened, expressed their disapprobation of the action, whilst the followers of the sheik passed by in gloomy silence. I must not forget, however, that a furious little old woman attacked me with her tongue during the whole time the procession was defiling by, calling

me a dog, a miscreant, a hog, a Jew, and a Christian; and at length worked herself up to such a pitch of fury, that she said she would strike me on the mouth, and took off her slippers to carry out the threat. Two good-natured dames hereupon interfered, and seizing hold of the old lady, who cursed and swore like Termagant, conjured me, 'by my head and eyes,' to get out of her clutches, for that she was a devil. I thanked them for their assistance, and taking their advice, began working my way along the street; but it was a long time before I ceased to hear the volley of imprecations that was sent over the heads of the crowd to my address.

I should have liked to be present at one of the feasts given by one of the returning pilgrims that night, listening to the wonderful stories he related, and to the sage commentaries of his guests, but this was out of the question. It is true that I received an invitation from my *donkey-boy*, who told me that all the 'respectable' Assinegos were going to gather at the house of one of the fraternity who had performed the pilgrimage; but this was rather intended as a compliment than anything else, and I was not tempted to disturb their humble festivities by my presence. I may mention that most of the pilgrims bring back a variety of relics as presents to their friends—such as bottles of water of a certain holy well called Zamzam, fragments of the kiswah, to be used as amulets, &c. A great number, as I have already mentioned, have attended to their commercial interests, and return with bales of Hejazi scarfs—sometimes bound round the head in lieu of an ordinary turban—and various Indian manufactures. Frankincense and kohl—a cosmetic used for painting the borders of the eyes, and thus imparting that lustre for which Oriental women are celebrated—form important articles of Arabian commerce.

The next morning I was again out early at the Haswah. Every position from which a view could be commanded was already occupied, especially the sides of the mounds that line the first portion of the road, the cemetery that extends beneath the walls in the direction of the Tombs of the Caliphs, and the house-tops of the suburb on the left. A heavy damp mist at first covered the country, and gave it a cheerless aspect. At the Haswah I found large crowds assembled round the mahmal, now uncovered. A considerable detachment of the pacha's regular infantry, in their slovenly white uniforms and red tarbooshes, was drawn up close by; whilst the Arnaut cavalry were either galloping up and down the plain, showing off their horsemanship, and brandishing their long quivering spears, or lying lazily about, waiting the order to march. A good deal of delay took place. Probably the emir thought it propitious to wait for the appearance of the sun from behind the veil of mist, which soon, indeed, impelled by a slight north wind, went rolling away towards the range of Mokattam. The dazzling desert, with its long majestic slopes; the promontories of cultivated land; the white palaces; the ruined tombs; the tapering palms; the domes, and minarets, and ramparts of the city; the giant walls of the distant citadel, with its enormous mosque, revealed themselves at once to the eye; whilst the flanks and gorges of the mountains remained long encumbered with gloomy clouds.

By the side of the sacred litter knelt a camel, which is looked upon with great respect by the people, on account of the following story:—Three years ago, it is said, the animal which bore the mahmal fell down in the desert, and died. This was an unexampled occurrence, and caused a mighty perplexity. The emir did not like to elevate one of the ordinary beasts of burden to the honourable post thus left vacant. A halt took place: but much time would have been spent in useless discussions, had not a wild camel suddenly appeared in the distance, hastening to put itself, of its own free-will, at the disposition of the emir! So remarkable a circumstance caused a deviation from the usual custom, according to which a fresh camel is chosen every time;

and the fine animal I now witnessed—which had probably strayed from a Bedouin encampment—had already three times performed the pilgrimage to Mecca. I may mention that the Arabs say—I believe without foundation—that seven mahmals, from seven sovereign princes, are yearly sent to the Holy City, and that there is always a race between the camels which shall first enter the temple. Fortune never fails to give the victory to the Egyptian.

The striking up simultaneously of a European and a native tune by two rival bands—the gathering of the escort, and the rush of the crowd to line the road—announced that the procession was about to commence. I hastened to return, and take up a position near the gate, from which I could obtain a view down the whole of the little defile by which the mahmal was to approach. The people seemed extremely anxious and excited, especially the women, and devotional exclamations resounded on all sides. At length the burnished instruments and glittering bayonets of the Nizam made their appearance, clearing their way through the agitated crowd, and the mahmal, swinging slowly from side to side with the step of the camel, followed close behind. As it advanced, the shouting became vehement and enthusiastic, and there was a general rush of those who occupied the foremost ranks to touch the sacred object. Most of those who could not get sufficiently near to lay their hands on the litter, raised them in the air, as if invoking a blessing.

Immediately behind the mahmal rode the Sheik-el-Gamel, or Sheik of the Camel, one of the remarkable characters of the procession. He seemed a man of about sixty years of age, strongly built, and covered with hair. A pair of drawers was his only article of clothing. His head was bare and bald, and he kept rolling it from side to side in a most painful manner. He accompanies the caravan during its whole journey; and from the time he leaves Cairo until he returns, never once ceases to revolve his head. What a state his brain must be in!

Next followed the emir and his attendants, on gorgeously-caparisoned horses; and then a group of camels, with bright-coloured saddles, decorated with flags. These, it was said, had, during successive years, been the bearers of the mahmal, and had been maintained by the government in idleness ever since. Then came a large band of native music, and the procession was closed by some five or six hundred irregular cavalry, mounted on rough-looking, but sturdy horses, and some armed with spears, others with firelocks. They were a wild-looking, uncouth set, and rode pell-mell, sometimes dashing in among the people, sometimes simulating a charge. As they crowded beneath the sombre arch of the Gate of Victory, whilst the vast crowd behind came precipitating itself from side to side to follow them, they imparted a very picturesque aspect to the scene.

Knowing that it would be useless to follow the procession of the mahmal through the narrow streets of the city, where it is slowly paraded, in order that the greatest possible number of people may behold and touch it, I determined to ride round the walls, and choose a good position at the citadel to see the finale of the ceremony. On my way, I noticed that the clouds were still hanging heavy and thick over the range of Mokattam: I never saw them assume so meteoric a character in Egypt. On all the rest of the scene, however, the sun shone brilliantly. After passing the Caliphs' Tombs, and the ruined suburbs in their neighbourhood, we entered by the gate leading to the citadel, and soon reached the lofty platform from which, it is said, the last of the Mamloks took a leap to save his life. Here a kiosque, which was in course of construction for Mohammed Ali—then sinking under the illness which removed him from the government of Egypt—afforded a splendid view over the two large spaces that lie between the foot of the citadel and the town—the Rumeileh to the right, and the Karamaidan to the left. These spaces are divided by a long row of low buildings

and a gate. Over the first rises that magnificent structure the mosque of Sultan Hassan; whilst the second is surrounded by barracks and public stores. The innumerable minarets of the beehive-like city, with here and there a garden, stretched beyond; then came a broad plain of verdure, streaked by the silvery reaches of the Nile; and in the background, from their unbounded basement of desert, rose in calm grandeur, cleaving the placid bosom of the sky, those mystic monuments, those eternal enigmas, 'the star-pointing Pyramids!'

A rush of voices drew my attention to the great square of Rumeileh, into which, from fifty avenues, a countless multitude—a sea of all bright colours—came pouring. Presently the soldiers, the mahmal—the whole procession, closed by the irregular horse, that came galloping after, as if in pursuit, made its appearance. The Rumeileh was soon traversed, and in the Karamaidan the Nizam formed a vast hollow square close at our feet. I now understood that Abbas Pacha, with all the grandes of Cairo, were sitting in a divan below, waiting to receive the mahmal. The spectacle that followed was curious. The people gathered round in vast crowds; the Arnauts performed their evolutions in the vacant spaces, whilst the camel bearing the mahmal was introduced into the hollow square. The band now struck up the Polka! and to this profane tune did the camel, bearing the sacred litter, move seven times round, each time increasing its speed, until it came to a gallop. A tremendous cheer followed; and then the crowd began to disperse. Great numbers of people, however, followed the mahmal to the gate of the citadel, where I went to meet it. Here the covering, which is the sacred part, was taken off, in order to be conveyed to a small mosque, to be kept in safe custody until wanted at certain periods of the year, when it is paraded about at several religious festivals held in various parts of Egypt, and at length cut up and distributed as relics.

During the process of taking it to pieces, the French artist I have before mentioned made another sketch. It seems this was observed; for when the Sheik-el-Gamel passed us on his way home, the boy that led his camel called out to him, and said, 'This is the dog that was making a picture of the mahmal!' The sheik glanced at us, gave an extra roll of his head, and replied, 'It is no matter, my son; it is no matter.' And so ends my account of the great event—the Return of the Pilgrims from Mecca.

THE OLD WRITING-MASTER'S HEIRESS.

A STORY FOR YOUNG PEOPLE.

'DRAW your hair-strokes lightly, Henri; lean heavily on the down strokes, and round off your capitals bravely. There: very good!' 'Armand, you are not attentive to-day. I can tell you, little boy, your poor mamma, who works so hard to pay for your instruction, cannot afford to have you idling.' 'Now, Jaques, finish your copy, and sign your name with a bold flourish at the end!' So did old Maître Caillot address his writing class, composed of three ruddy-faced boys, whose coarse habiliments and rough hands showed that they belonged to the lower rank of life. The pupils were seated at a rickety-looking desk, in the scantily-furnished upper room of a house situated in one of the meanest and most obscure suburbs of Paris. The master was a thin man, bent from age, but whose vivid glance and sharp careworn features seemed to tell that the vigour of his mind was unimpaired. While standing behind the boys, and instructing them in the art of penmanship, he would sometimes pause and sigh, and look round at a very young girl who was busy at the earthen stove preparing bread soup for their dinner. She was a fair-haired delicate-looking creature, about fifteen, and small for that age; her little hands were scarcely able to lift the earthen pot, in which she put two thin slices of bread, an onion, a few sweet herbs, a bit of dripping,

some pepper and salt, and then filled it with water. With an effort she placed it over the tiny fire in the stove, and watched and skimmed it as it gradually boiled. She then drew forward a small table, covered it with a coarse clean cloth, and neatly arranged on it two bowls, plates, knives and forks, together with a jug of water, and half a brown loaf. Having finished these arrangements, she took some needlework, and seated herself near the stove. At length the hour of one sounded from a neighbouring church, and the pupils of Maître Caillot rose from their seats, and with a politeness which children in this country would do well to imitate, bowed respectfully to their teacher, and then to Mademoiselle Louise, before they withdrew. The old man sighed as the last little gray blouse disappeared. 'Three francs a week,' he said, 'are all I can earn by teaching; and yet thou seest, Louise, I take as much pains to improve these little plebeians as when I directed the hand of the king's son.'

M. Caillot's lot had indeed been one of strange vicissitude. The office of writing-master to the royal princes had been for a number of years hereditary in his family. His ancestor had instructed Louis XIV.; and his son, in due course, taught the dauphin; and so on in regular succession, until the disastrous events of the Revolution brought the good Louis XVI. to the scaffold, and consigned his innocent little son to a lingering death. Then M. Caillot lost his office, and very nearly his life. He had saved scarcely anything from the wreck of his possessions, and now lived in great poverty with his granddaughter. She was his only remaining relative, with the exception of an aged female cousin—Madame Thérèse—who lived at the other side of Paris, and whose circumstances were as indigent as his own. Louise was an amiable, affectionate girl; she attended her grandfather, did the household business, and yet found time to earn a few sous by needlework, so as to add to the small pittance which M. Caillot gained by teaching writing to a few of their neighbours' children. He was certainly very poor, and yet there was a circumstance that appeared to Louise very mysterious. Her grandfather, when in a communicative mood, often spoke of a treasure he possessed, and which she should inherit; and on one occasion he showed her a green tin box, carefully locked, which he said contained a precious possession, not available to him, as he could never bring himself to part with it, but which would one day enrich her. This box he always kept cautiously secreted at the head of his bed; and Louise could not help sometimes wondering why grandpapa would not use his treasure, and prevent them suffering so much from poverty; yet fearing to annoy him, she never spoke on the subject, but quietly put her trust in God, humbly hoping that in His good time their circumstances might alter.

A change indeed came, but it was one that filled the tender heart of Louise with sorrow. One day, about six months from the time when our narrative opens, M. Caillot complained of being very ill: a sort of numbness seized his limbs, and he had scarcely strength to reach his bed. Louise immediately warmed water to bathe his feet, and begged the mistress of the house to fetch a doctor. While waiting his arrival, the old man said in a feeble voice, 'Louise.'

'Well, dear grandpapa?'

'Death is approaching, my child. I feel I have not long to live; and but for leaving thee, I should feel quite happy. I leave thee, my child, in the midst of a dangerous world, yet I feel assured the goodness of God will never forsake thee as long as thou continuest to keep His commandments. I have very little to give thee: the sale of the furniture will do little more than pay the rent; and my other possessions, with one exception, are of trifling value. Give me the tin box at the head of the bed.' Louise did so; and the old man put a small key of curious workmanship into her hand. 'Try, Louise,' he said, 'to earn your livelihood by

honest industry; but if your resources fail, then open this box, dispose of its contents, and they will bring you a sum of money. They are'— But here his voice failed, his breathing became laboured, and pressing once more the hand of his beloved child, he expired just as the physician and the landlady entered the room. The former, seeing that all was over, immediately withdrew, and the latter busied herself in performing the last sad offices for the dead. As to poor Louise, she was stupified with grief; and it was not until the funeral was over, and she found herself alone, that she was able to rouse herself, and consider her situation.

The door opened, and her landlady, Madame Duval, entered. 'Well, Mademoiselle Louise,' she said, 'I am come to ask what you intend to do? Has your grandfather left any money?'

'No, madame, nothing but one five-franc piece and a few sous. But perhaps you will have the kindness to put me in the way of disposing of the furniture, which will, I hope, pay your rent and the other expenses?'

'It will hardly do that,' said the landlady, casting a scornful glance around. 'And then pray how are you to live?'

'I can work neatly, madame; and I hope you will kindly allow me to remain with you, while I try to procure employment.'

'Oh, if that's all you have to depend on,' cried the landlady, 'I promise you I cannot afford to keep you here. Why, child, in these hard times a young creature like you could not earn enough to keep you from starving, and then how am I to be paid for your lodging?'

'You need not fear, madame,' said Louise a little proudly, 'that I shall be a burden to you. Though dear grandpapa did not leave me money, he told me he left me a "treasure" in this tin box; but I am not to open it until I am really in want.'

'Oh, that alters the case,' said the woman. 'Of course, my dear Mademoiselle Louise, I shall be most happy to have you here; indeed I was only jesting when I spoke of sending you away. But wont you open the box now? I'm sure you must be anxious to see what it contains.'

'No, madame,' said Louise firmly; 'I must obey grandpapa's wishes, and not open it unless I fail to earn a livelihood by work.'

'As you please, my dear child; as you please,' replied Madame Duval. But she thought to herself, 'She is an oddity, like her old grandfather: I must humour her for the present, and keep her here, so that I shall secure my share of the treasure.'

In pursuance of this plan, the landlady lavished fond words and caresses on Louise: she invited her to eat with herself, and took care to provide some little delicacy for dinner. She disposed of the furniture to the best advantage; and after having satisfied all claims, presented Louise with three francs, saying—'See, my dear, how well it is for you to have an attached friend to manage your little affairs: if less carefully disposed of, your furniture would not have brought half the sum.'

Louise was a gentle, well-principled girl; but she was young, and the pernicious flattery and indulgence of her false friend soon produced an evil effect on her mind. She indeed fell speedily into idle habits. She procured some work from a neighbouring shop, but the remuneration was very small; and she often thought, as she held her needle with a listless hand—'How tiresome it is to work so long for a few sous: I really think I might open grandpapa's box, and enjoy what he has left me!'

It happened one day that Louise saw a very pretty bonnet in a milliner's window; it seemed as if it would exactly fit her, and she inquired the price. 'Fifteen francs,' the milliner said. 'Very cheap, indeed too cheap; but it would become mademoiselle so much, that she would let her have it at first cost.'

Louise looked and hesitated. Her conscience whispered, 'You have not got the money; and even if you had, fifteen francs could be better spent than in gratifying vanity.' 'But the bonnet is so pretty,' she thought again; 'and I can open grandpapa's box to-night, and then I shall be so rich, that fifteen francs will seem a trifle.' Conscience was silenced, though not satisfied; and Louise returned to the house of Madame Duval. They sat down to dinner; but the young girl felt so agitated that she could not eat.

'Madame,' she said at last, 'I think I will open the box to-night. You know I have tried to work, and could earn but little, and 'tis right that I should repay you for your kindness.'

At these words the landlady embraced her. 'Oh, my dear child,' she said, 'you know I love you so much, that I would gladly have you here without any payment. But come, where is the key? Let us look at your treasure.'

Louise produced the key, unlocked the box, and raised the cover. Madame Duval thrust in her eager hand, and drew forth—what?—a bundle of manuscripts carefully tied up. They were evidently written by juvenile hands, and looked, indeed, like schoolboys' copy-books. The landlady and Louise looked carefully through them, hoping they might contain bank-notes, or some paper of value; but when nothing of the kind appeared, the rage of Madame Duval knew no bounds. She accused M. Caillot and his granddaughter of being impostors, and even threatened the poor girl with being sent to prison.

Louise was quite stunned by her misfortune, and could scarcely find words to implore the compassion of her cruel landlady. At length, having exhausted her anger in various abusive epithets, Madame Duval stripped the poor child of everything she possessed, leaving her nothing but a few ragged garments to cover her, and then turned her out of doors, to seek a shelter where she could.

Night was fast approaching, and Louise found herself in a dreadful situation: sent at such an hour to wander, penniless and half naked, through the streets of Paris. When Madame Duval was closing the door, Louise ventured to ask her for the fatal tin box.

'No,' replied she, 'that may be worth a few sous, so I shall keep it; but if you wish for the trumpery papers in it, you may have them, as a precious *souvenir* of your thievish old grandfather.' So saying, the cruel woman threw her the carefully-tied-up manuscripts, and then shut the door.

The heart of Louise was humbled; she felt no inclination to return railing for railing. 'I have deserved this misfortune,' she thought; 'it comes as the just punishment of my idle selfishness. May God protect me, and enable me to act better in future!' After a short but fervent prayer, her mind felt calmed, and she bethought herself of the aged cousin of her grandfather, Madame Thérèse. 'I will go to her,' she said, 'and ask her to let me share her lodging; and perhaps, by working hard, I may contribute to her support as well as my own.' Holding her grandfather's papers carefully in her hand, she set out. The humble lodging of Madame Thérèse was situated in an obscure suburb, and Louise had some difficulty in finding it out. At length a good-natured shoemaker, living in the same street, directed her to the door, and the young girl knocked gently.

'Come in,' said a feeble voice. Louise entered.

The room was small, but very clean: a bed, covered with a white quilt, occupied one corner, and a cupboard another; at the side was a small earthen stove, in which a few sticks were burning, and two or three chairs and a table completed the furniture of the apartment. Madame Thérèse was seated on a low stool near the stove: her dress, though humble, was very clean, and her gray hair, drawn tightly under a muslin cap, gave a venerable air to her wrinkled features. She had been for many years so crippled by rheumatism, as to be unable to walk; but her hands being free from

the disease, she was constantly employed in knitting, and thus gained a scanty subsistence. Yet often in the cold dark days of winter the poor widow would have perished but for the timely assistance of a few charitable neighbours, who, out of their own small supply, used to bring her little presents of soup, bread, and firing. It was now four years since she had seen Louise, her own infirmities, and those of M. Caillot, having prevented their meeting: indeed so secluded was her life, that she did not even know of her cousin's death, and was therefore much surprised both at seeing Louise, and hearing all she had to tell.

Encouraged by the maternal kindness with which she was received, the young girl made a frank confession of her errors, and concluded by saying—'Now, dear madame, if you will allow me to share your room, I will try, with the blessing of God, to be some comfort and assistance to you. I am young and strong; and indeed I will try to work hard.'

'You are welcome, my dear child,' replied Madame Thérèse: 'while God spares me, we will never part; indeed I feel assured that He has sent you to me, and that all our misfortunes, if borne with cheerful resignation, will prove for our real good.'

She then set herself busily to prepare some bread soup, and when it was ready, pressed Louise affectionately to partake of it. Afterwards she made her share her clean hard bed; and the young girl, happy to have found so truly good a friend, slumbered peacefully till morning.

When Louise awoke, she set herself to consider her present situation, and resolved to leave nothing undone that might contribute to her cousin's comfort. Accordingly, having dressed herself, she assisted Madame Thérèse in putting on her clothes, and then arranged the room neatly, while the old lady prepared breakfast.

'How handy and useful you are, my child!'

'Oh, aunt—will you allow me to call you aunt?—I was always accustomed to attend dear grandpapa, and shall be glad to do the same for you.'

Their light meal over, Louise asked her aunt, as she now called her, to look up in the cupboard her grandfather's manuscripts; for although she could see no intrinsic value in them, yet, as a memento of him, she prized them.

The old lady looked at them. 'I am a poor scholar,' she said; 'but certainly these papers appear to me like a schoolboy's scribbling. I cannot think why my poor cousin called them a treasure. However, for his sake we will put them up carefully, and I certainly feel indebted to them for bringing you to me.'

Madame Thérèse then lent Louise a cloak with which to cover her shabby garments, and directed her to a large haberdasher's shop, where she might succeed in gaining employment.

It was situated in one of the busiest streets of Paris, and a number of gaily-dressed people were purchasing at the counter when Louise entered. Ready-made shirts, blouses, and children's clothes were among the articles sold; and these Louise hoped to be employed in making. She advanced timidly towards the mistress of the establishment, and said, 'If you please, madame, do you require a workwoman?'

'Not at present,' was the reply; and poor Louise was turning away, when the woman added, 'If you can work well, and on low terms, I may find something for you to do. Have you any one to recommend you?'

'Only my cousin with whom I live.'

'Who is she?'

'Her name is Madame Thérèse Caillot. She lives in a room, No. 27, Rue —; but she cannot come out of doors, for she is disabled by rheumatism.'

The shopkeeper laughed. 'A fine recommendation truly! You don't suppose, child, that in this establishment we trust our work to persons who can give no better reference than you offer?'

The tears stood in the young girl's eyes. 'Good-morning, madame,' she said humbly, and left the shop.

She recollected passing another warehouse of less splendid appearance in the next street, and thither she turned her steps. There had been a heavy fall of rain, and the pavement was muddy. As Louise walked slowly on, she struck her foot against something that jingled; she stooped, and took up what looked like a lump of mud, but felt very heavy. Louise wiped it, and then perceived it was a purse. With some difficulty she opened the clasp, and found it contained twenty gold pieces. What a treasure! Her first feeling was joy; her second, 'This money is not mine; I must seek for the owner, and return it.' She then resolved to take it to Madame Thérèse, and be guided by her advice as to the best means of restoring it. Securing it carefully in the folds of her dress, she entered the second shop, and applied for work. She met with a similar refusal; and with a heavy heart was quitting the shop, when a few words spoken at the counter arrested her attention. An elderly gentleman was purchasing some gloves, and when the parcel was handed to him, he said, 'I fear, madame, I must be in your debt for these until to-morrow, for I have just been so careless as to lose my purse.'

'Ah, monsieur, what a pity! As to the gloves, don't mention them I pray; it will do to pay for them at any time. But how did monsieur lose his purse?'

'I can scarcely tell. I remember taking out my pocket-handkerchief in the street next to this, and probably drew my purse out with it; but I cannot be certain. It was rather a serious loss—twenty Napoleons.'

Louise advanced eagerly—'Monsieur,' she said, 'I believe I have found your purse; and she handed him the one she had found.'

'You are a very honest little girl,' said he; 'this is indeed my purse, which I never expected to see again. And now what shall I give you for finding it?'

'Thank you, monsieur; I do not expect anything.'

'That's no reason why you should not be rewarded. You look poor: tell me where you live?'

Louise replied that she lived with her cousin, an old woman, and was now seeking for work to support them both.

'Madame,' said the gentleman, turning to the mistress of the shop, 'will you, on my recommendation, supply this girl with work. I heard you refuse her just now, as you said she could give you no reference. I think we may both be assured of her honest principles.'

'Certainly, monsieur, I shall have much pleasure in trying her; and if she works well, I shall be able to supply her with pretty constant employment.'

'Now,' said the gentleman, turning to Louise, 'here are four Napoleons for you; they are only the just reward of your honesty. I leave Paris to-morrow with my family, and shall probably be absent for some months, otherwise I would ask my wife to call at your lodging; but on our return, I hope she will be able to see you. Here is a card with my name and address.'

Louise gratefully thanked the kind gentleman, who hastened from the shop; and she then took the materials for a shirt, promising to bring it back finished the next day. What joyful news she had on her return for Madame Thérèse, and how cheerfully did they partake together of their evening meal, to which a salad and a bit of cheese were added, to make a little feast!

Louise continued to work hard and steadily. Winter set in this year with unusual severity, and poor Madame Thérèse became quite disabled. Rheumatism attacked her hands as well as her feet, and rendered her quite unable to work. She suffered dreadful pain at night, which Louise sought tenderly to relieve by rubbing and chafing her limbs. The four Napoleons were gradually expended in providing medicines and nourishing food for the invalid. Taught by adversity, Louise learnt to forget herself, and was never more happy than when ministering to the wants of her aunt. Before the end of February, their money was all spent, and the earnings of Louise, always small, were farther

diminished by the expense of candle-light, and the necessity of giving up much time to attending the invalid. To add to their trials, the young girl's own health began to fail. Loss of rest, constant sitting at her needle, and want of sufficient food, produced their usual effect. She became pale and thin, her breathing was quick, and her appetite failing.

Madame Thérèse became much alarmed about her. One day she remarked her frequently putting her hand on her side, and sighing as if in pain.

'My child,' said the old woman, 'the good gentleman whose purse you found is a physician. I am sure if he knew of your illness, he would do something for you. Will you, then, call at his house to-day, for indeed I feel uneasy about you?'

Louise felt reluctant to go. She feared it would look like begging from one who had already done much for her; but her aunt fearing that her health was seriously affected, managed to satisfy her scruples, and induced her to go.

Nothing but disappointment awaited them. Louise found the house shut up, and the old man who was left in charge of it told her the family were not expected home for two months. She returned sorrowfully to her lodging, and continued with Madame Thérèse to struggle against poverty and illness.

When Dr Leverrier, the loser of the purse, at length returned to Paris, he called to mind the poor little girl, and one day, accompanied by his wife, sought out the humble lodgings of Madame Thérèse. Ascending the dark, narrow staircase, they knocked at the door, and the voice of Madame Thérèse said 'Come in.' They entered. The room, though perfectly clean, looked almost bare; every little article of furniture had by degrees been parted with to meet the necessities of the poor inmates. Louise, whose weakness had considerably increased, was seated on a bundle of straw, which formed their only bed, and her wasted fingers were feebly endeavouring to finish some work which ought to have been returned the day before. So changed was her appearance, that Dr Leverrier could scarcely recognise her; but she knew him, and blushed deeply as she rose and said, 'Aunt, this is the kind gentleman who gave me the money.'

'I am sorry,' said Madame Leverrier, 'to see you look so poorly; but we are come now to do what we can to relieve you, and I hope, please God, you will soon be well.' She then entered into conversation with the old woman, while her husband inquired into Louise's state of health. He found she had no fixed disease, nothing which might not be removed by good food, fresh air, and freedom from toil. These he took care should be secured to her, by giving her aunt a sum of money sufficient for their present necessities, and promising to continue it until both the invalids should be restored.

They then took their leave, followed by the grateful blessings of Louise and her aunt. That evening Madame Leverrier sent them a comfortable bed and blankets, together with a warm gown and shawl for each. How comfortably they slept that night! and how fervently did they bless the goodness of God in sending them such friends!

Dr Leverrier continued frequently to visit them: he used to send Louise out to walk, and sometimes sat with her aunt during her absence. One day he asked the old lady to tell him all the particulars of their history, which she very willingly did. When she mentioned the manuscripts which M. Caillot had bequeathed to his granddaughter as a treasure, and which had proved so useless to her, he became greatly interested. He was a member of several scientific societies, and very fond of antiquarian research; it therefore occurred to him that the papers might possibly possess some value, and he asked anxiously to see them.

'You can have them, and welcome, monsieur,' said Madame Thérèse. 'Louise, poor child, was greatly attached to her grandfather, and for his sake she keeps

them carefully locked up. I will open the cupboard and get them for you.'

Accordingly, she handed Dr Leverrier the bundle tied up with tape. He opened it, and found it to consist of several small parcels. One of them was labelled, 'The writing of his most gracious Majesty Louis XIV., in his eighth year, while instructed by me (Signed) L. CAILLOT.' Dated 1646. Another had a similar superscription, describing it as the writing of the dauphin, the amiable pupil of Fenelon, and grandson to Louis XIV. Then came the first attempts at penmanship of Louis XV. Then the first copy-book of the unhappy Louis XVI. And lastly, tied up and covered with peculiar care, the writing of the little 'Captive King,' Louis XVII. As we mentioned before, the office of writing-master to the royal family had been for many generations hereditary in that of M. Caillot, and these mementos of their princely pupils' progress had been carefully treasured by each of its representatives, and transmitted to his successor. They had all been well off, and therefore none of the family of Caillot had had any temptation to part with these precious relics until they descended to the grandfather of Louise, who yet, in the midst of his poverty, could not bring himself to sell them. He knew that, as antiquarian curiosities, they would fetch a high price, and therefore justly regarded them as forming a provision for Louise. The suddenness of his death prevented his explaining to her in what their value consisted, and, as we have seen, she remained ignorant of it for a long time.

'These are indeed treasures,' said the doctor: 'I know some persons who will gladly purchase them at a high rate. I have no doubt they will bring Louise several thousand francs.'

Just then the young girl entered. Her eye glanced at the rolls of paper spread out on the little deal table.

'Ah,' she said, 'poor grandpapa's manuscripts that he prized so highly! I have often wondered why he valued them so much.'

'Don't wonder any more, my good girl,' replied her friend. 'They are indeed most valuable; and I heartily congratulate you on your good fortune, which I hope and trust you will try to deserve.'

He then explained to her the nature of the papers; and when he mentioned the large sum which he expected they would sell for, Louise clasped her hands and exclaimed, 'Oh, dear aunt, at last I shall be able to make you comfortable!' Then turning to the doctor, 'Dear sir, how can I ever thank you for your kindness!'

It was all she could say; the sudden emotion was too much for her; and Dr Leverrier took his leave, carrying the manuscripts with him, and promising to return as soon as possible.

Two days elapsed, and on the third morning, as Louise was preparing her aunt's breakfast, the doctor entered.

'Good-morning, my friends,' he said; 'I bring you good news. Louise,' he added smiling, 'how many thousand francs do you suppose yourself possessed of?'

'Dear sir, you are jesting! I cannot guess.'

'Well, I will tell you my adventures since we last met, and then you can judge. I have a particular friend, the president of the Society of Antiquaries, and to him I took your manuscripts. He was in ecstasies. "They are invaluable," he said; "quite unique—worth any money! I am not very rich, and yet I would gladly give thirty thousand francs for them." I explained to him the circumstances connected with them, and told him that as I was acting for another, I considered it my duty to obtain the highest possible price for them. He quite agreed with me, and directed me to a brother antiquary of immense wealth, who, he said, would, he was sure, purchase them. Accordingly I took them to Monsieur Lemont (that is his name), and, as I expected, he was delighted with them. He finally offered to pay fifty thousand francs for them, which, considering it the full value for them, I agreed, in your

name, to accept. I have lodged the sum (about L.2000) to your credit in the bank. It will produce you a yearly income of about three thousand francs, and you have now only to consider how to spend it to the best advantage.'

The first impulse of Louise was to kneel down and humbly thank God for his great goodness. She then affectionately embraced her aunt, and turning to Dr Leverrier, 'Oh, sir, how can I thank you!' It was all she could say.

The doctor sat with them for some time, and when Louise became calm, proceeded to discuss her future plans. She was ready to be guided implicitly by him; and his advice was, that she and her aunt should immediately remove to some neat, quiet lodging in the outskirts of Paris, and when settled there, that Louise should apply herself to the cultivation of her mind, in order to become fitted for the new rank in which she was to move.

This judicious counsel was followed, and through the kind offices of the doctor and his lady, Louise and her aunt were speedily established in a nice lodging in the suburbs. The young girl's first care was to provide Madame Thérèse with everything necessary to her comfort; her second, to engage teachers and purchase books for herself. Her efforts at self-improvement were crowned with success. Being now exempt from bodily toil, her health became robust, and she acquired insensibly both polish of manner and refinement of appearance. No one who saw the neatly-dressed venerable old lady walking out, leaning on the arm of an elegant-looking girl, could have recognised Madame Thérèse and Louise as they appeared formerly. Dr Leverrier and his family continued to take the kindest interest in their welfare. He frequently invited them to his house, feeling sure that Louise was a safe and profitable companion for his daughters.

It happened one day that Louise and her aunt were taking an airing with Madame Leverrier. They stopped at a shop to make some purchases, and as they were coming out, an old woman accosted them, begging for alms. She was clothed in rags, and looked miserably poor. Madame Leverrier put a trifle in her hand, and was passing on, when she was surprised to see Louise stop and look eagerly at the beggar woman.

'Can it be!' said the young girl. 'Are you Madame Duval?'

'Yes,' replied she, 'that is my name; but, mademoiselle, how do you know me?'

'I knew you well at one time: have you forgotten Louise Caillot?'

The unhappy woman hid her face with her hands, and said, 'Have pity on me—I am justly punished!'

Louise hastily explained to her friends who it was; and Madame Leverrier having requested the shopkeeper to allow them the use of his parlour for a short time, they caused Madame Duval to come in and explain how she came to be so sadly reduced.

With many expressions of shame and humiliation, the unfortunate woman told them that, by a course of extravagance and idleness, she had gradually become poorer and poorer; until at length everything she possessed was seized for debt, and she was compelled to wander about begging. 'Then,' she said, 'when I found myself a homeless outcast, without a friend, I recollected my cruelty towards you, mademoiselle; and I felt that the just vengeance of God was pursuing me for my sin against an orphan. I thought of all you must have suffered, and I longed to know what had become of you. I am a miserable creature both in mind and body: can you forgive me?'

Louise burst into tears. 'Most freely I forgive you, madame,' she said, 'and will gladly do what I can to assist you.'

She then gave her some money, and having inquired where she lived, promised to send her further assistance. The poor woman seemed ready to embrace her feet with thankfulness, but Louise and her friends hastened away, overcome with various emotions. Louise and her aunt spent that evening at the house of their friends; and when Dr Leverrier came in, his wife told him their morning's adventure. He listened to it with much interest, and asked Louise what she wished to have done for her ancient enemy.

'I should like, sir,' she replied, 'to relieve her wants, and afford her the means of support.'

'Then you have no feeling of enmity towards her? Recollect how badly she treated you.'

The young girl's eyes filled with tears as she looked at him almost reproachfully. It was sufficient answer.

'You are right, my dear child,' said the doctor; 'I spoke only to try you. True greatness of spirit is shown in forgiving an injury, not in returning it; and after all, though she meant it not for good, Madame Duval has been the means of rendering you a real service; for the hard season of adversity you have passed through has been the blessed means of subduing what was evil in your heart, and conferring on you "the ornament of a meek and quiet spirit."'

MACKAY'S 'WESTERN WORLD.'

Two books of travels in the United States have just come under our notice—one in three volumes by Mr Alexander Mackay,* the other a pocket volume by Mr Archibald Prentice. These works differ not less in external aspect than in the manner in which they are written. That of Mr Mackay consists chiefly of a series of disquisitions on social and political topics, united by a thread of personal narrative; while the small volume of Mr Prentice is a lively description of a tour, and scarcely aspires to be instructive. In the meanwhile, laying the last-mentioned book aside, we propose to confine our attention to Mr Mackay's 'Western World,' which, though tedious in many parts, is far from being without interest. The writer tells us in his preface that, from a residence of some time in the country, he has possessed better opportunities of drawing sound conclusions than travellers of an ordinary class; and as far as we can judge, his views are warranted by the actual and prospective state of society. He would, however, be a very dull person who could travel through the United States without having his sentiments roused on divers matters of social concern, or who would not be impressed with the national greatness that awaits our American brethren.

Mr Mackay begins his observations at Boston, and thence proceeds southwards; each place he visits being a peg whereon to hang a string of observations. New York suggests a disquisition on the commercial policy of the States. At present, a contest rages between the manufacturing and agricultural interests, in reference to free trade; but conversely to that which prevails in Britain. The American agriculturists and cotton growers desire freedom of import and export: the manufacturers alone desire protection; they fear the spindles and looms of Lancashire. What a pity to find such men as Mr Webster and Mr Clay advocating restrictions on trade! In spite of all odds, the free-traders are in the ascendant: the tariff bill of 1846 decided that custom-house duties should be taken only on a revenue basis. Yet that in effect tends to preserve monopoly, and a great modification of duties is contended for. While on this subject, our author refers to the vast injury which America could inflict on England. One is startled by a mere announcement of the fact. The internal peace and prosperity of Great Britain depend on the regular action of the cotton trade. Throw Lancashire and Lanarkshire idle, by stopping the supplies of cotton, and who will say what would be the consequences? For these supplies we are dependent on America. 'This is a dependence,' observes Mr Mackay, 'which

* The Western World, or Travels in the United States in 1846-7. By Alex. Mackay, Esq., of the Middle Temple, Barrister at Law. London: Bentley. 3 vols. 1849.

cannot be contemplated with indifference. As regards the supply of cotton, we are as much at the mercy of America as if we were starving, and to her alone we looked for food. She need not withhold her wheat: America could starve us by withholding her cotton. True, it is as much her interest as ours to act differently; and so long as it continues so, no difficulty will be experienced. But a combination of circumstances may be supposed in which America, at little cost to herself, might strike us an irrecoverable blow: a crisis might arise when, by momentarily crippling our industry, she might push in and deprive us of the markets of the world. And who, should the opportunity arise, will guarantee her forbearance? . . . It is the consciousness of this absolute dependence that induces many to look anxiously elsewhere for the supply of that for which we are now wholly beholden to a rival. The cultivation of cotton in India is no chimera; the time may come when we may find it our safety.' It should have been added, that the late opening of British ports to American corn is the best guarantee against the catastrophe which is feared.

In America all is activity and hopefulness. The possibility of doing great things, striking out new fields of enterprise, causes a universal restlessness. Repose is unknown. In this old country we are at almost every step governed by traditions: we are terrified to do anything which is not sanctioned by the usage of centuries. No man is listened to who has not attained to gray hairs; if he is bald, so much the better. We have another social peculiarity. Politics do not form a quite respectable subject. Criticism of state policy is a kind of half treason. No man is so estimable as he who candidly declares he neither understands nor cares for matters of government. In America all this is different. Old men have there little to say; young men take the upper hand; and politics are not only perfectly respectable, but commendable. 'The American,' says Mr Mackay, 'is from his earliest boyhood inured to politics, and disciplined in political discussion. The young blood of America exercises an immense influence over its destiny. Perhaps it would be better were it otherwise. Frequently are elections carried, in different localities, by the influence exerted on the voters by the active exertions of young men who have as yet no vote themselves. A minor may, and often does, make exciting party speeches, to an assembly composed of men, many of whom might individually be his grandfather.' We should be inclined to say that this is going a little too far. There is a good mid-way in everything.

With something to condemn in their hot political contests, we give the Americans credit for one thing, in which they are clearly our superiors. 'In America there is no volunteering one's services as a representative.' Suitable candidates are brought forward by committees of electors, and no others have a chance of success. Volunteer candidates are called 'stump orators,' and their pretensions are treated only with derision. How much better is this than the beggarly practice which prevails in Great Britain, where candidates condescend to the meanness of seeking votes, and not only so, but of paying for them also—in England by bribes of money, in Scotland by expectancies of situations!

Mr Mackay mentions that few things are more surprising in American society than the sway exerted by young unmarried ladies. With us, a Miss fills a very subordinate social position: she is nobody, and enjoys consideration only through her parents. In the States, 'the mother is invariably eclipsed by her daughters,' who issue invitations, and receive company, as if independent beings. The moment a lady submits to the matrimonial tie, she is laid on the shelf, and soon disappears from general society. 'Whilst the young ladies engross all attention to themselves, the married ones sit neglected in the corners, despite the superiority which they may sometimes possess both in personal charms and mental accomplishments.' Possibly the great demand

for wives is the main cause of this social peculiarity. Our author speaks of the number of society meetings, at which young ladies assist nearly every night in the week. Dorcas societies are particular favourites, as they blend a bit of amusement and gossip with the obligations of charity. 'The ladies of a congregation, married and expectant—the latter generally predominating—meet in rotation at their respective houses at an early hour in the afternoon, sew away industriously by themselves until evening, when the young gentlemen are introduced with the tea and coffee: whereupon work is suspended, and a snug little party is the consequence, characterised by a good deal of flirtation, and closed by prayer: the young men afterwards escorting the young ladies home, and taking leave of them, to meet again next week under the same happy circumstances.' In general society, the conversation is said to be greatly made up of 'dreary commonplaces, jokes, and rapid compliments.' We would hazard the remark, that conversation cannot be more commonplace in America than it is in ninety-nine houses in a hundred throughout England—a talk of furniture, the weather, articles of eating and drinking, the Opera, the last picture exhibition, and the comparative lighting qualities of gas and candles.

Travelling in a railway car between Philadelphia and Baltimore, Mr Mackay witnesses the extent to which Americans carry their antipathy to the unfortunate coloured race. 'At one end of the car in which I was seated sat a young man, very respectably dressed, but who bore in his countenance those traces, almost indelible, which, long after every symptom of the colour has vanished, bespeak the presence of African blood in the veins. The quantity which he possessed could not have been more than $12\frac{1}{2}$ per cent. of his whole blood, tinging his skin with a shade, just visible, and no more. If his face was not as white, it was at all events cleaner than those of many around him. I observed that he became very uneasy every time the conductor came into the car, eyeing him with timid glances, as if in fear of him. Divining the cause of this conduct, I determined to watch the issue, which was not long delayed. By and by the conductor entered the car again, and, as if he had come for the purpose, walked straight up to the poor wretch in question, and without deigning to speak to him, ordered him out with a wave of his finger. The blood in a moment mounted to his temples and suffused his whole face; but resistance was vain; and with a hanging head, and broken-hearted look, he left the carriage. He was not a slave; but not a soul remonstrated, not a whisper was heard in his behalf. The silence of all indicated their approval of this petty manifestation of the tyranny of blood.' Some coarse remarks followed from various persons in the car, commendatory of this odious expulsion. Shocked at what he had seen, our author proceeded to search out the unfortunate young man, whom he found seated in a bare wooden crib, along with about a dozen negroes, who, envious of his white tinge, 'rather rejoiced than otherwise at the treatment he had received.' Mr Mackay states, that on a late occasion the captain of a British steamer on Lake Ontario violently expelled a gentleman of colour from the dinner-table in the cabin, in concession to the prejudice of some Virginians who were present. For this illegal and audacious act he was very properly apprehended on a warrant at Kingston, and had to pay a heavy fine for his officiousness; 'his command being continued to him on condition of his not offending in a similar manner in future.' It is pleasant thus to see British law vindicating the rights of humanity irrespective of race or colour.

Slavery is visibly observed to be a blight wherever it rests. The slaveholding states are palpably retrograding; the non-slaveholding states are rapidly advancing. 'View it whichever way you will,' says Mr Mackay, 'whether as a crime or as a calamity, this institution in the United States invariably carries with it its own retribution. However indispensable it may be to the

wealth and productiveness of some localities, it is a present curse to the land, fraught with a terrible prospective judgment, when we consider the hopelessness of its peaceful removal, and the awful catastrophes to which it will inevitably lead. Where activity and progress are the rule, all that is not advancing assumes the melancholy aspect of retrogression. North Carolina is virtually retrograding. Since 1830, her population has increased but at a very trifling ratio, which is partly to be accounted for by the numbers who annually emigrate from her, as from Virginia and other sea-board states, to the Far West. Her foreign trade, which was never very large, has also of late years been rapidly on the decline, and there is now but little prospect of its ever reviving. She still holds some rank in point of wealth and political importance in the confederation; but every year is detracting from it, and throwing her more and more into the background. She has not only lagged behind most of the original States amongst whom she figured, but has permitted many of the younger members of the Union greatly to outstrip her. Were Virginia freed from slavery, it would become one of the most favourable fields of settlement for emigrants of a wealthy class. As it is, it is, like other slaveholding States, shunned by men of capital and enterprise.

Railways have been already constructed in the United States to the extent of 5700 miles, and 4000 miles are in course of construction. This far exceeds the aggregate length of railways in Great Britain; but the two systems can scarcely be compared. Our lines are generally double; constructed with great care; and are decorated with splendid station-houses and termini: great sums have also been paid for land; and the parliamentary expenses have been enormous. In America the cost of land has been comparatively trifling; the rails are usually of timber, shod with thin slips of iron; the station-houses are wooden booths; and the bridges are also of wood, on an inexpensive scale. By this studying of economy, the railway system has been pushed to great lengths in the States, vastly to the benefit of the more remote regions. When the country is more densely peopled, the lines will of course be improved. At present, although the rate of transit is only from 15 to 20 miles an hour, they answer the purpose of travellers, and make a return of from 5 to 8 per cent. to the shareholders. Much as we admire the elegance and even grandeur of some of our railway termini and other works, we wish, all circumstances considered, that plainer models had been adopted.

On the subject of the Mississippi valley and its productive powers we have some useful particulars. This valley, which is interlaced with 15,000 miles of navigable rivers, and will in time contain a population of a hundred and fifty millions, is capable of furnishing food for the whole of Europe. The soil is generally so fertile and easily cultivated, that a farmer is well remunerated if he gets sixpence a bushel for his wheat. Ten shillings may be assumed as the cost of producing a quarter of wheat in most portions of the prairie land of the valley; and if 20s. be added for cost of transit to England, grain of a fair description at 30s. a quarter may be looked for. At present, from the want of capital, and also from the demand on the spot by a new and growing population, large shipments of wheat cannot be made to Great Britain; but every year the capacity for export will increase, and we have no doubt that ultimately there will be an abundant influx of American wheat at the price stated. From the wheat-growing States on the Atlantic, grain will be exported at a considerable lower rate. Of course facts of this kind will be kept in remembrance by British farmers in renewing their engagements for land.

From Canada, wheat may be transported to Quebec or to New York at about equal rates, the cheaper line of transit, all things considered, being to Quebec. But there the preference ceases. The freight from New York to Liverpool is cheaper than from Montreal or Quebec to Liverpool. So great is the disparity, says

Mr Mackay, that he has known 7s. 6d. sterling asked at Montreal for every barrel of flour to be conveyed to Liverpool, whilst forty cents, or about 1s. 8d., was the ruling freight at New York. Curiously enough, this great difference, which is so injurious to the colonists, arises from nothing else than a wish on the part of Great Britain to benefit the colonies. According to the navigation laws, no vessel but one of British or colonial build can bring goods from a British colony to England; the object of the law being to keep our own trade to ourselves. On this account foreign vessels taking goods to Canada cannot reload with cargoes for England. If the shippers of Montreal had as much wheat on hand for England as would fill ten vessels, and ten empty American ships were lying at the quay, they could not employ them. They would require to wait until British-built vessels came in and were prepared to take the wheat on board; consequently these British-built vessels having a monopoly, would charge a comparatively high price for their services. Such is one of the effects of what are called 'the navigation laws,' for the abolition of which an effort is now about to be made in parliament. 'It frequently happens,' says Mr Mackay, 'that the quays both of Montreal and Quebec are overlaid with produce waiting for exportation, but which remains for weeks on the open wharfs for want of sufficient tonnage to carry it to Europe. . . . It is of this monopoly, and its ruinous consequences, that the Canadian so loudly and so bitterly complains. Such, indeed, is sometimes the want of tonnage in the Canadian seaports, that produce forwarded to tide-water, with a view of being conveyed to Liverpool that season, is not unfrequently detained until the opening of navigation in the following year. The inconvenience of this is great, especially as wheat and flour are perishable commodities, and the exporter loses all the advantages which the English market may in the meantime have offered him. The remedy for this evil is obviously to throw the navigation of the St Lawrence open to the shipping of the world.' What a howl will this proposition raise among the shipowners of Glasgow and Liverpool!

The rapid transmission of news among us has been rather conspicuous since the electric telegraph was put in requisition; but in this department of affairs we are still outdone by our American brethren. 'For some time after the breaking out of the Mexican war, the anxiety to obtain news from the south was intense. There was then no electric telegraph south of Washington, the news had therefore to come to that city from New Orleans through the ordinary mail channels. The strife was between several Baltimore papers for the first use of the telegraph between Washington and Baltimore. The telegraph office was close to the post-office, both being more than a mile from the wharf, at which the mail steamer, after having ascended the Potomac from the Aquia Creek, stopped, and from which the mail bags had to be carried in a wagon to the post-office. The plan adopted by the papers to anticipate each other was this:—Each had an agent on board the steamer, whose duty it was, as she was ascending the river, to obtain all the information that was new, and put it in a succinct form for transmission by telegraph the moment it reached Washington. Having done so, he tied the manuscript to a short heavy stick, which he threw ashore as the boat was making the wharf. On shore each paper had two other agents, one a boy mounted on horseback, and the other a man on foot, ready to catch the stick to which the manuscript was attached the moment it reached the ground. As soon as he got hold of it, he handed it to the boy on horseback, who immediately set off with it at full gallop for the telegraph office. There were frequently five or six thus scrambling for precedence, and as they sometimes all got a good start, the race was a very exciting one. Crowds gathered every evening around the post-office and telegraph office, both to learn the news, and witness the result of the race. The first in secured the telegraph, and in a quarter of an hour afterwards the news

was known at Baltimore, forty miles off, and frequently before the mail was delivered, and it was known even at Washington itself. On an important occasion, one of the agents alluded to as being on board beat his competitors by an expert manoeuvre. He managed, unperceived, to take a bow on board with him, with which, on the arrival of the boat, he shot his manuscript ashore, attached to an arrow, long before his rivals could throw the sticks ashore to which theirs was tied.'

Mr Mackay recommends emigration to the United States in the strongest possible terms, and expresses a surprise, in which we unite, that this country should be embarrassed with a redundant population—redundant in reference to existing means of support—while so great and glorious a field of settlement is open for all on such very easy terms. While society in Great Britain seems to be gradually pauperising—while 'what to do with our beggars' is becoming the most urgent of questions, it is pleasant to read the following passages in reference to a contrary state of things in America:—'The most important feature of American society, in connection with its physical condition, is, that competence is the lot of all. No matter to what this is attributable, whether to the extent and resources of the country, or to the nature of its institutions, or to both, such is the case, and one has not to be long in America to discover it. It is extremely seldom that the willing hand in America is in want of employment, whilst the hard-working man has not only a competency on which to live, but, if frugal, may soon save up sufficient to procure for himself in the West a position of still greater comfort and independence. There are paupers in America, but, fortunately, they are very few. They are generally confined to the large towns; nor need they subsist upon charity, if they had the energy to go into the rural districts and seek employment. This, however, is not applicable to the majority of them, who are aged and infirm. It may be laid down as a general rule, without qualification, that none are deprived of competency in America except such as are negligent, idle, or grossly improvident.' Truly, it has been said, America is the paradise of the working-man.

ANCIENT IMPLEMENTS OF POPULAR SPORTS.

AMONG the suburban outskirts of London city, long since swallowed up in the ceaseless progress that converts green fields into *brick-fields*, and *brick-fields*, with the old rural footpaths they have displaced, into paved streets and squares, some memento of former associations still survives, as a memorial of 'the country' that skirted in olden times the city's northern walls.

Clerkenwell Green still sounds as a strange memento of the days gone by, when its gentle pastures and green slopes lay along the 'River of Wells,' as the 'Fleet Ditch' was then termed, while beyond extended in grassy fields, or still greener morasses, Spitalfields, Moorfields, and Finsbury. Ben Jonson tells us of 'the archers of Finsbury, and the citizens that come a-ducking to Islington Ponds;' and many a sly hit by the wits of James's Court at the Cockney-rivalry of Robin Hood's feats, shows that these civic heroes were often sorely galled by lighter sharpshooters than the archers of Finsbury Fields.

Even so early as 1598, Stowe complains of 'the ancient daily exercises in the long-bow by citizens of the City, now almost clearly left off and forsaken;' and subsequent enactments of James I. proved altogether unavailing in preventing the total abandonment of 'the yard-long shaft,' which had proved the safety and honour of England on many a hard-fought field. Just beyond the old site of Moorgate, the Artillery Grounds still preserve a small area rescued from these old archery grounds, for civic feats of mimic war; but a recent chance discovery in the same neighbourhood carries us back to still older sports and pastimes of 'the London 'prentices' in these extra-mural fields.

In the collection of the Society of Antiquaries at

Somerset House, as well as in various private London museums, specimens of ancient bone-skates may be seen, such as in early times, and even, it is believed, to a comparatively recent period, were used by the citizens of London in their favourite winter pastime on the ice. The Serpentine River of former days was an undrained marsh lying outside London wall, at the foot of the long slope by which the endless tide of Paddington and Highgate omnibuses now wend their way to the Angel at Islington. The winter rains accumulated here into a broad and shallow pond, which required no long continuance of frost to convert it into a safe and ample sheet of ice. Towards this the pleasure-seeking crowds of citizens might then be seen jostling one another as they pushed their way through the old Moorgate archway, each carrying in his hands a pair of homely skates, fashioned in most cases of the leg-bone of a horse, with a hole drilled from side to side at the one end, and into the end at the other—the latter probably to receive a peg by which more effectually to secure the cords that fastened it to the foot. These simple skates, dropped from time to time, and buried in the mud and soil, at first occasioned some little perplexity to the antiquaries of London when they revisited the light. It is not unlikely, indeed, that they may have often enough been found and tossed aside before, as mere musty bones, during the constant excavations in the City and its neighbourhood. But now that archaeology has become a science with numerous students and devotees, the barest bone is often found worth picking; and since attention was first directed to the subject, about eight years ago, many such bone-skates have been dug up in various districts around London, and particularly in the immediate neighbourhood of the City.

The examples which we have seen of these rude specimens, illustrative of the antiquity and progressive improvement of one of the most popular and healthful recreations of our northern winters, were dug up, in the year 1839, in Moorfields, near Finsbury Circus, London. Though Moorfields—to use a familiar Cockney pun—are no more fields, the whole area having long since been built over, and laid out in streets and squares, beyond which miles of brick tenements and stone-paving extend between it and the open fields, the ground still exhibits, in the course of any excavations by which it is opened up, distinct evidences of its former character as a bog or marsh; and it will presently appear to what uses it was put so long as it retained this character.

Strutt, in his 'Sports and Pastimes,' while confessing his inability to trace the introduction of skating into this country, refers to evidence of its existence in the thirteenth century; and adds an opinion, which few will be inclined to dispute, that 'probably the invention proceeded rather from necessity than the desire of amusement.' The rudeness of these bone-skates is such as seems to justify the antiquary in assigning to them a very early date: and a curious passage, which occurs in Fitz-Stephen's description of London, enables us to establish their identity with those used in that writer's own time—that is, in the reign of Henry II., 1151–1189. Fitz-Stephen, in describing the sports of the citizens of London, says—'When that great moor, which washeth Moorfields at the north wall of the city, is frozen over, great companies of young men go to sport upon the ice;' &c. After enumerating the various modes of sliding, he adds, 'Some are better practised to the ice, and bind to their shoes bones—as the leg-bones of beasts—and hold stakes in their hands, headed with sharp iron, which sometimes they strike against the ice; and those men go on with speed, as doth a bird in the air, or darts shot from some warlike engine!'

It is rare, indeed, that the antiquary discovers so distinct and unmistakable a reference not only to the character and uses of a chance-found relic, but to the exact locality in which it has lain unheeded for nearly seven centuries.

In Bishop Percy's 'Five Pieces of Runic Poetry,' translated from the Icelandic language,* more than one refer-

* London, 1763.

ence occurs to skating, as one among the most essential qualifications of a northern warrior. In 'Harold's Complaint' the hero thus enumerates his slighted worth:—'I know how to perform six exercises. I fight with courage, I keep a firm seat on horseback, I am skilled in swimming, *I glide along the ice on skates*, I excel in darting the lance, I am dexterous at the oar, and yet a Russian maid disdains me!'

In M. Mallet's 'Introduction à l'Histoire de Danemarck,'* a quotation is made from the 24th table of the 'Edda,' in which the following allusion to skating occurs:—'Then the king asked what that young man could do who accompanied Thor? Thialfe answered, That in running upon skates he would dispute the prize with any of the countries. The king owned that the talent he spoke of was a very fine one,' &c.

But a still more definite description of the ancient skate than that already referred to occurs in Olaus Magnus's 'History of the Nations of the West.' He speaks of it as being made of iron, or of the shank-bone of a deer or sheep, about a foot long, filed down on one side, and greased with hog's lard to repel the wet.

Mr C. Roach Smith, on showing examples of these bone-skates to the eminent northern antiquary Herr Worsaae of Copenhagen, was informed by him that similar examples had been found in Holland, in Scandinavia, and particularly in the southern part of Sweden. He referred him also to a very curious passage in one of the old Scandinavian mythological songs, in which it is said that *Oller* or *Uller*, god of the winter, runs on bones of animals over the ice.

It cannot surprise us to find such early and varied evidences of the practice of skating on the ice among the northern races of Europe, nor of their use of a skate so readily supplied as one of the least-valued spoils of the chase. It seems indeed surprising that a skate so very simple and easily accessible should not still remain in use among our juvenile population, with whom the more refined and complicated modern instrument of steel is sometimes a matter not readily obtained.

No allusion occurs, that we are aware of, among early Scottish writers to a similar practice among the natives of our northern region, though it cannot be doubted that there also skating was one of the winter pastimes of our ancestry from a very early period. Gavin Douglas, in the prologue to the seventh book of the 'Æneid,' gives a most vigorous and picturesque description of the northern winter, in which he depicts both the aspect of nature and the influence of the season on man and beast; but no allusion occurs to such popular pastimes as those to which the earlier Scandinavian and Icelandic poets refer.

Most Scottish readers are familiar with Sir David Lindsay's lively satire on the obsequious courtiers of James V., which occurs in the 'Complaynt':—

'Ilk man efter thair qualitie,
Thay did solist his majestie,
Sum gart him ravell at the rakket,
Sum harlit him to the hurly-hakket,' &c.

The hurly-hakket, more correctly *hurly-hawkie*, was a boy's game practised in James's time and later, on the slope of the Heading Hill, or ancient place of execution near Stirling Castle. Seated on the inverted bone of a cow's head, the youth descended this slope with thundering speed, to the wonder of quiet people, and his own no small delectation. On the Calton Hill near Edinburgh, the game was practised at the end of the last century with a horse's head; but the skull of the ruminant seems to have been the more normal vehicle, as the name *hawkie* is simply the familiar appellation for a cow in Scotland.

It may readily be believed that as the bones of animals were among the early spoils of the chase, they would be adapted in a rude age to many uses for which the devices of modern ingenuity and civilisation have found other substitutes. Among the rude savages of the South Sea Islands, as well as among the Kamtchatkins and Esquimaux, the bones and horns of many animals are turned to account in the construction of their weapons

and implements; and we frequently find among the contents of early British tumuli, evidence that our own barbarian ancestry applied them to the same useful purposes.

It was not, however, for objects essentially useful only, but also for the instruments used in games of chance and skill, that the bones of animals were found applicable by our rude forefathers. In Herr Worsaae's comparison of the 'Antiquities of Ireland and Denmark,' in the third volume of the proceedings of the Royal Irish Academy, he refers to ancient draftsmen of bone, of a hemispherical shape, and with a hole in the flat bottom, which frequently occur in considerable quantities in Norwegian tumuli, and are also occasionally found in Ireland. They are believed to have formed the implements of gaming among the roving Norsemen, their form being designed to admit of their use on shipboard, so that they might not be liable to displacement by the rolling of the vessel.

Many allusions of our early dramatists also suffice to show that such games as nine-pins, loggats, skittles, and the like, were originally played with bones. The name of skittles is evidently derived, like the older term kayles, or kayle-pins, from the French *quille*, a pin. And to the latter game—of which Strutt gives an illustration, somewhat oddly derived from a missal of the fourteenth century—the more modern nine-pins are obviously traceable. Several of these games are enumerated in early English statutes against gaming, particularly in more than one of Henry VIII. And a game called *closh*, which appears to have been nearly identical with nine-pins, is specified in a similar statute so early as the reign of Edward IV.

'Loggats,' says Sir Thomas Hanmer, one of the early editors of Shakspeare, 'is the ancient name of a play or game, which is one of the unlawful games enumerated in the 33d statute of Henry VIII.: it is the same which is now called kittle-pins, in which the boys often make use of bones instead of wooden pins, throwing at them with another bone instead of bowling.'

In a rare old play of Queen Elizabeth's reign, entitled 'The Longer thou Livest the more Fool thou Art,' a dunce is introduced, who boasts of his skill

'At skates, and the playing with a sheep's joynite.'

So, too, in the well-known scene with the gravedigger in Hamlet—

'That skull had a tongue in it, and could sing once. Here's fine revolution, an' we had the trick to see it. *Did these bones cost no more the breeding but to play at loggats with them?* Mine ache to think on't!'

These allusions place beyond doubt the use of bones in these popular games of the sixteenth and seventeenth centuries; and so, too, we find a later dramatic writer of Charles II.'s reign, in a play called 'The Merry Milk-Maid of Islington,' making one of his characters address another thus—

'I'll cleave you from the skull to the twist, and make nine-skittles of thy bones!'

These latter illustrations may perhaps be considered as having a very slight connection with the subject of ancient bone-skates. They suffice, however, to show to how many uses, which have since been lost sight of, these waste articles of the chase and of the kitchen were applied in early, and even in comparatively recent times.

POPULAR MEDICAL ERRORS.

CONCLUDING ARTICLE.

Drawing Salves and Strengthening Plasters.—People entertain some curious notions as to the properties of salves. We continually hear them talk of drawing salves. It might be possible, no doubt, to trace some of the old doctrines of medical men in these sayings, when what was called the humoral pathology was in vogue. I seldom pass many days without hearing that a particular ointment draws too much, or not sufficiently. The least that can be said of it is, that the phraseology is not good, and altogether indefinite, for the greater part of those who employ it scarcely know precisely what they wish to express. As to strength-

* 2 vols., London, 1770.

ening plasters, I must confess my complete want of faith. To communicate strength by a pitch plaster is more easily said than done. I remember there was formerly a great cry for strengthening plasters at the Manchester Infirmary. Many old men and women would beg for them, as if a plaster was the greatest favour that could be conferred; and afterwards, when their plasters were worn out, they would endeavour, in the most ingenious way imaginable, to bring round the conversation to the subject of plasters, and end by requesting to have others, 'as the virtue,' they said, 'was gone out of the old ones.' It would be well if they could find any relief from their real ailments from such impotent means. As to what are called 'warming plasters,' more faith may be given to them, for these act more or less like blisters, being indeed composed of pitch plaster and blistering plaster, and to some extent, therefore, useful in cases where external irritants are necessary.

People Heavier after Death.—That a person weighs heavier when dead than when living, is one of the popular errors which one cannot well suppose to prevail amongst the better-informed part of society. The phrase *dead weight* has probably sprung up from this idea. Why a person should be heavier when he is dead is not very apparent, unless the principle of life is to be considered as one of levity, as phlogiston was supposed to be by the philosophers of a former day. The supporters of Stahl's celebrated doctrine of phlogiston believed that when a body was burnt, a principle, which they called *phlogiston*, escaped from it in the form of light and heat; but unfortunately for this view, it was found, when the products of combustion were carefully collected, that they weighed more than the body did previously. This would have been fatal to their doctrine, had not the idea been broached that phlogiston was a principle of levity, which, being removed, left the body heavier than before.

This was of course quite fallacious, and so would such an idea be with respect to life. One reason that a dead body is thought to be heavier than a living one is probably this, that in carrying a living person we have the centre of gravity adapted by the person carried to suit the convenience of the carrier, and maintained in a position as far as possible to fall within the base of his body. Again, the elasticity of the structures of the body, especially the cartilages, though not in reality diminishing the weight, gives an appearance of lightness, as we see in the beautiful movements of the stag, and this would seem to corroborate the notion of living creatures being lighter than dead ones. We have also phrases which would seem to imply that lightness was the concomitant of gentleness. How often we are admonished by the poets to tread lightly on the ashes of the dead!

Mother's Marks.—Of what are called 'mother's marks,' I may say a word or two. Everybody has heard of strawberries and cherries being represented on children's heads and backs, and people pretend that these appearances alter according to the season of the year, as the fruit may or may not be ripe. The question as to the origin of these marks appears at one time to have given rise to rather a warm controversy. A Dr Samuel Turner, in the eighteenth century, published a work on diseases of the skin, in which there was a dissertation on these congenital marks contained in the 12th chapter, and in which he attributed them to the influence of the mother's imagination. In answer to this part of the work, an anonymous publication appeared denouncing the idea as a vulgar error. However, Dr Turner discovered the work to be written by a Dr James Augustus Blondel, and looking upon the reply as a direct attack upon himself, republished his views in an appendix to another work which he was then bringing out. Dr Blondel was not, however, to be set down in this manner, and again controverted these opinions. Dr Turner now began to consider his reputation seriously at stake, and supported his views by references from Skenkious, Hildanus, Horstius, and others

who are fond of dealing in prodigies. Though it is evident that he had the worst of the discussion, the fourth edition of his work, which appeared in 1731, is said still to have contained the 12th chapter without alteration, and to be supported with a fierce-looking portrait of the author.

Proverbs.—There are two proverbial sayings which may be just alluded to, particularly as one of them has perhaps a somewhat injurious influence. We often hear people use the expression—'Stuff a cold, and starve a fever;' and many think this plan should be literally adopted, and proceed to act accordingly. I never properly understood the sense of the proverb until one of my professional friends explained to me that there was an ellipsis in the sentence, and that it should be understood as a brief way of saying, 'Stuff a cold, and you will have to starve a fever;' that is, if you do not refrain from generous living during a cold, ten to one you will set up a fever in which you will have to abstain altogether. This is certainly a more sensible reading of it. The next proverb is, 'That twilight is the blind man's holiday.' At first it would seem a ridiculous saying, because if want of light is to excuse us from work, a blind man must have a perpetual holiday.

The proverb no doubt relates to the well-known fact, that a man with a cataract can see better in the twilight. This is very easily explained; for in the softened light called twilight, the pupil of the eye expands, and as the diseased lens which intercepts the light is chiefly opaque in the centre, it follows that the rays of light are in some degree admitted when the pupil is fully dilated.

Bones Brittle in Winter.—Accidents frequently happen in winter-time from the slippery state of the roads; but there is a general belief that the bones are more brittle in winter than at another time. In frosty weather, it is a common remark made to domestics to be careful in cleaning the windows, as the glass is brittle; and this certainly is the case, and for an obvious reason. The outside of the window is exposed to the cold frosty air, whilst the inside is warmed by the heated air of the room; hence the two sides are expanded in different ratios, and a slight accident is sufficient to break the pane; just as hot water, put suddenly into a cold glass, may crack the vessel; especially if it be so thick that the heat is not readily transmitted through it. Well, then, probably the notion about the brittleness of the human bones in winter is derived from the fact I have mentioned; but the animal heat does not differ in cold weather, except indeed on the surface of the body. Nor would there otherwise be any analogy in the cases. That the bones of *old* people are more brittle than those of the young, is quite true; but this is of course altogether a different question.

Of the Lock-Jaw.—Many people entertain a very singular idea of the complaint called lock-jaw. It is, I think, often supposed that the disease consists alone in the forcible closure of the jaw, and that the patient, being unable to get sustenance, dies from inanition. Some of these people, who consider themselves a little more ingenious than their neighbours, will suggest to you the extraction of a tooth as a remedy, which, they think, may not have presented itself to others. In reality, the stiffened state of the muscles of the jaw is only a part of a general condition of spasm, the origin of which is ill understood, notwithstanding the great attention which has been devoted to the subject, and the ability which has been directed to it. The body is sometimes bent back like a bow in a most frightful manner, and the hands and feet dreadfully distorted. As the complaint first shows itself about the muscles of the jaw, it may have acquired the name from this circumstance. Some non-professional people mistake dislocation of the jaw for lock-jaw. When the jaw is dislocated, it remains widely open, and the patient is unable to shut his mouth. One laughable case is related of a person singing very

loudly at a concert, who suddenly became silent, and was found staring with his mouth wide open. At first people thought he was mad, but at length it was discovered that his jaw was dislocated.

Red Flannel.—The very name red flannel brings to me a thousand recollections of old women with mountains of bandages round their heads, or of swelled knees and joints carefully swathed like Egyptian mummies. It is really surprising to see the number of rolls which surround the heads of some of the aged and invalid poor. I have frequently endeavoured to effect their removal or diminution, but I always found I was touching on a sore point; and though I succeeded in some cases, I could evidently see there would be a struggle to return to the old red flannel as soon as my attendance was discontinued.

But the red flannel is not used merely for warmth: it is looked upon as a sort of remedy in itself. In the same way as you would apply a blister, or an ointment, or lotion, so you use the red flannel. But though the red flannel is so generally confided in by the poor, in this, as in many other instances, I have in vain sought from any of its supporters to obtain any precise idea of its *modus operandi*. The efficacy of red flannel must then be conceded, I suppose, as an ultimate fact, which must be granted, and not reasoned upon.

It would be altogether profane to ask whether the virtue depends on the coarseness of its texture, or upon its colour, or some properties imagined to reside in the dye. People do not say, shall I use coarse flannel? or shall I keep the part well wrapped up in many folds of flannel? but shall I use red flannel?

Mussels.—Mussels, it is well known, sometimes produce nettle-rash, and other unpleasant symptoms; so that it is common to say people are *musselled*. We often hear it stated that this depends upon a certain part of the mussel, and that when this part is taken out, there is no fear of bad effects arising. I cannot for my own part speak on this point, but I will simply quote what Dr Paris states. 'The mussel,' says he, 'is a species of bivalve, which is more solid, and equally as indigestible, as any animal of the same tribe. The common people consider them as poisonous, and in eating them, take out a part in which they suppose the poison principally to reside. This is a dark part, which is the heart, and is quite innocuous: the fact, however, is sufficient to prove that this species of bivalve has been known to kill, but not more frequently perhaps than any other indigestible substance.*

Galvanic Rings.—A little while back it was very much the custom to wear what were called galvanic rings for the relief of rheumatic and other pains. Even granting that these rings have a galvanic action, I do not myself see how they are to cure such complaints. Perhaps they are intended to act like charms. Formerly, rings were very much used to charm away diseases. Pettigrew tells us that Paracelsus had a ring made of a variety of metallic substances, which he called *electrum*. 'These rings were to remove cramp, palsy, apoplexy, epilepsy, or any pain. If put on during an epileptic fit, the complaint would be immediately cured.' Sometimes rings were formed from the hinges of a coffin. 'Andrew Boorde,' he continues, who lived in the reign of Henry VIII., says, 'the kynges of Englande doth halowe every yere crampe rynges, which rynges worn on one's finger doth help them which hath the crampe.'†

'In the Gentleman's Magazine for 1794, we are told that a silver ring, which is made of five sixpences, collected from five different bachelors, to be conveyed by the hand of a bachelor to a smith that is a bachelor, will cure fits. None of the persons who gave the sixpences are to know for what purpose, or to whom they gave them.‡ Bachelors were not, however, the only contributors of these charms.

'The London Medical and Physical Journal for 1815 notices a charm successfully employed in the cure of epilepsy, after the failure of various medical means. It consisted in a silver ring, contributed by twelve young women, and was constantly worn on one of the patient's fingers.* It seems, then, that the practice of curing diseases by metallic rings is by no means new. A short time ago I attended a gentleman for a rheumatic complaint, who all the time wore one of these galvanic rings. I do not know whether he attributed his recovery to the ring or his medicine, or whether he divided the credit.

Heart.—There are some errors which are of an anatomical nature. There is a common misunderstanding as to the position of the heart, though it is common enough to talk of the heart *being in the right place*. People say the heart is on the left side; but in reality it inclines only a *little* to the left, being almost immediately behind the breast-bone or *sternum*, and is situated higher than I think is generally conceived by non-professional people. The breast-bone is the bone with which the ribs are articulated at the front of the chest, and immediately behind the breast-bone lies the heart, surrounded of course by its proper coverings. I have known people imagine the stomach to be immediately at the termination of the windpipe, because the feelings of indigestion are often referred to this point. In respect to the heart, the term ossification, applied to disease of the heart, is generally but imperfectly understood. There are people who think the heart is literally and completely changed into bone. A person would, however, die long before such a change could be brought about. There are, however, some very extraordinary cases related by Corvisart, Burns, Haller, and others, in which large portions of the heart were replaced by ossific deposits. In general, however, when ossification of the heart is spoken of, it is merely meant that the valves of the heart are impeded in their action by ossific deposits, and instead of falling in a manner to close the orifices over which they are situated, remain to a certain extent patulous.

Amongst this class of anatomical errors is that which we sometimes find people run into, of supposing that they have what they call a *narrow swallow*. Such people cannot take pills. The same people will swallow much larger bodies with ease. I have several times been called to children who have swallowed marbles and other large bodies, whilst the mothers have asserted that their throats were too narrow to admit the passage of pills. In these cases there seems a want of consent in the muscles of deglutition with those of the mouth and palate, and this must proceed from a mental feeling, sometimes difficult to overcome.

Inward Fits.—Nurses often speak of *inward fits*. When I first heard the phrase I was somewhat puzzled with it. There is something terrible in fits, but still more terrible in supposing that they are going on in the interior without any external manifestation. The truth is, these inward fits (*quasi fights*) are no more inward than any other fits, and scarcely to be dignified by the term fits. I conceive that the expression is applied to those little nervous twitchings which we occasionally see during sleep. An infant will have its mouth drawn up into a sort of smile, and the eyelids will be scarcely properly closed.† The nurses will shake their head, and tell the anxious parent that it is suffering from inward fits. I do not like the term, for I think it is calculated to produce a sort of alarm which is not always justified by the case.

Means of Preventing Contagion.—I think it is often supposed that medical men are in the habit of carrying about them some drug which has a protective influence against the operation of contagion. If this were the case, it would be very proper that it should be made generally known. I remember, when I was very young,

* Paris on Diet, p. 163. 1836.

† Op. Cit. p. 87.

‡ Op. Cit. p. 62.

* Pettigrew, p. 62.

† Burns's Practice of Midwifery, p. 786. 1838.

having a little bag of camphor stitched in my dress, to prevent fever during the time that it was prevalent. Some people will suppose that smoking is desirable. I have known ladies put lavender in their handkerchiefs if they thought they were going to run any risk. Most of the remedies used are of this class—namely, such as have a powerful odour. The celebrated Hahnemann, the author of the homœopathic doctrines, thought that belladonna had a protective influence against the scarlet fever. It was, however, to be given internally, of course in a very small dose—three grains dissolved in an ounce of distilled water, of which three drops were to be administered twice daily to a child under twelve months. The homœopaths assert that if it does not prevent the disease, it renders it mild.

The plan of carrying camphor bags reminds one of the old amulets and charms to which we have already given attention. I mentioned the importance of rings. In the Harleian manuscripts (according to Pettigrew, p. 67), is a letter from Lord Chancellor Hatton to Sir Thomas Smith, written at the time of an alarming epidemic. He writes thus:—‘I am likewise bold to recommend my most humble duty to our dear mistress (Queen Elizabeth), by this letter and *ring*, which hath the virtue to expel infectious airs. . . . I trust, sir, when the virtue is known, it shall not be refused for its value.’ Perhaps some one may bring out cholera rings—I dare say people would be found to buy them. The more ridiculous a remedy is, the better it often takes. However, medical men do not attach importance to these portable remedies, at least such as operate merely in giving out an odour without exercising any chemical influence on the atmosphere. I am not now alluding to such as chloride of lime, which is to be kept in the house. The subject of the prevention of contagion is much too vast and important to admit of cursory remark, and I shall content myself, therefore, with denying that medical men are in the habit of carrying about their persons remedies to prevent contagion.

Of Bile.—Just as I stated that the public use the word *scurvy* as a general term for diseases of the skin, so it is common to use the epithet *bilious* for a number of distinct affections. A person is in the habit of putting his stomach out of order, and declaring that he is very bilious; or another shall lay the flattering unction to his soul that some serious structural disease is all attributable to the bile. There is one common mistake made in respect to vomiting *bile*. Whenever bile is found in the ejected matter, it is at once concluded that it was owing to a redundancy of bile that the sickness was created. This is, however, in most cases an error, for the bile is brought into the stomach from the first bowel (the duodenum) by the straining efforts of the patient, which cause a reflux or regurgitation of the bile in opposition to its natural route. Thus nothing is more common than to find bile ejected from the stomach in sea-sickness, even when the sufferer set out on his voyage in the full enjoyment of health.

Whilst engaged in writing out these brief memoranda of medical errors, I stumbled on a book on the subject, written by a Dr Jones, dated 1797, in which he places in the category of popular errors some which one would scarcely expect to meet with in such a connection. Thus he considers it as one of the errors to be refuted, ‘that a physician just called to a patient ought, as soon as he comes down stairs, to inform the family of the name of the distemper.’ Most medical men will agree with him that this is certainly an egregious error.

He also alludes to the absurdity of asking a physician questions at a dinner-table, which it is impossible for him to answer without a careful inquiry into the case of the querist. I shall not now, however, trespass longer on the attention of the reader, but conclude by again reminding him that if I have been led to mention many things of a very commonplace kind, I have been obliged to do so by the nature of the subject; and in respect to the style or manner in which this has been done, it appeared to me that common things would

be best described in common and familiar language, and colloquial phrases would best embody the ideas with which they are generally connected.

THE SEVEN-SHILLING PIECE;

AN ANECDOTE.

It was during the panic of 1826 that a gentleman, whom we shall call Mr Thompson, was seated with something of a melancholy look in his dreary back-room, watching his clerks paying away thousands of pounds hourly. Thompson was a banker of excellent credit; there existed perhaps in the city of London no safer concern than that of Messrs Thompson and Co.; but at a moment such as I speak of, no rational reflection was admitted, no former stability was looked to; a general distrust was felt, and every one rushed to his banker's to withdraw his hoard, fearful that the next instant would be too late, forgetting entirely that this step was that of all others the most likely to insure the ruin he sought to avoid.

But to return. The wealthy citizen sat gloomily watching the outpouring of his gold, and with a grim smile listening to the clamorous demands on his cashier; for although he felt perfectly easy and secure as to the ultimate strength of his resources, yet he could not repress a feeling of bitterness as he saw constituent after constituent rush in, and those whom he fondly imagined to be his dearest friends eagerly assisting in the run upon his strong-box.

Presently the door opened, and a stranger was ushered in, who, after gazing for a moment at the bewildered banker, coolly drew a chair, and abruptly addressed him. ‘You will pardon me, sir, for asking a strange question; but I am a plain man, and like to come straight to the point.’

‘Well, sir?’ impatiently interrupted the other.

‘I have heard that you have a run on your bank, sir.’

‘Well?’

‘Is it true?’

‘Really, sir, I must decline replying to your very extraordinary query. If, however, you have any money in the bank, you had better at once draw it out, and so satisfy yourself: our cashier will instantly pay you;’ and the banker rose, as a hint for the stranger to withdraw.

‘Far from it, sir: I have not one sixpence in your hands.’

‘Then may I ask what is your business here?’

‘I wished to know if a small sum would aid you at this moment?’

‘Why do you ask the question?’

‘Because if it would, I should gladly pay in a small deposit.’

The money-dealer stared.

‘You seem surprised: you don’t know my person or my motive. I’ll at once explain. Do you recollect some twenty years ago when you resided in Essex?’

‘Perfectly.’

‘Well, then, sir, perhaps you have not forgotten the turnpike-gate through which you passed daily? My father kept that gate, and was often honoured by a few minutes’ chat with you. One Christmas morning my father was sick, and I attended the toll-bar. On that day you passed through, and I opened the gate for you. Do you recollect it, sir?’

‘Not I, my friend.’

‘No, sir; few such men remember their kind deeds, but those who are benefited by them seldom forget them. I am perhaps prolix: listen, however, only a few moments, and I have done.’

The banker began to feel interested, and at once assented.

‘Well, sir, as I said before, I threw open the gate for you, and as I considered myself in duty bound, I wished you a happy Christmas. “Thank you, my lad,” replied you—“thank you; and the same to you: here is a trifle to make it so;” and you threw me a seven-

shilling piece. It was the first money I ever possessed; and never shall I forget my joy on receiving it, or your kind smile in bestowing it. I long treasured it, and as I grew up, added a little to it, till I was able to rent a toll myself. You left that part of the country, and I lost sight of you. Yearly, however, I have been getting on; your present brought good fortune with it: I am now comparatively rich, and to you I consider I owe all. So this morning, hearing accidentally that there was a run on your bank, I collected all my capital, and have brought it to lodge with you, in case it can be of any use: here it is, sir—here it is;’ and he handed a bundle of bank-notes to the agitated Thompson. ‘In a few days I’ll call again;’ and snatching up his hat, the stranger, throwing down his card, walked out of the room.

Thompson undid the roll: it contained L.30,000! The stern-hearted banker—for all bankers must be stern—burst into tears. The firm did not require this prop; but the motive was so noble, that even a millionaire sobbed—he could not help it. The firm is still one of the first in London.

The L.30,000 of the turnpike-boy is now grown into some L.200,000. Fortune has well disposed of her gifts.

SNODGRASS THE INVENTOR.

THE decease of a generally little known, but useful inventor, Neil Snodgrass, is noticed by the ‘Glasgow Citizen’ newspaper. This ingenious man, who has just died in his seventy-third year, appears to have begun his inventive career by applying steam to the purpose of heating public works, &c. Mr Snodgrass was also the inventor of the ‘Scutcher,’ or blowing machine, commonly called in cotton-mills the ‘Devil,’ by which an important saving in the raw material is effected, while the cotton is prepared in a much more uniform manner than could possibly be done by the hands. It is, however, in connection with the steam-engine that the name of Mr Neil Snodgrass chiefly deserves to live. Notwithstanding Watt’s grand invention of the separate condenser, and the completion of his numerous other improvements, a mighty defect still existed at the very heart of the machine. How to render the piston of the steam-engine perfectly steam-tight, and yet capable of moving in the cylinder without enormous friction, was, in the early history of the invention, felt to be an insuperable difficulty. This difficulty would have been considerably lessened had it been possible to construct a perfectly true cylinder; but as no skill in workmanship could secure this necessary height of perfection, the only alternative remaining was to render the periphery of the piston elastic, so as to adapt itself to the inequalities of the surface against which it was to slide. To effect this object, the piston was constructed with an upper and lower flange, between which a mass of hemp was wound, which it was necessary to renew and tighten at frequent intervals, and to keep at all times profusely saturated with grease. In order to provide a substitute for this primitive and clumsy process, Mr Snodgrass passed many a night of anxious thought. Having in 1818, with the assistance of a number of master spinners who had profited by his inventions, built a mill of his own at Mile End, Glasgow, he commenced in 1823 to make experiments in packing the piston on an entirely new plan, and in 1824 his splendid invention of metallic packings was given gratuitously to the public. These packings consisted of segments of metal acted upon by springs pushed outward from the centre, and thus adapting themselves to the inequalities of surface unavoidable in the cylinder. This novel and beautiful invention of an elastic metal piston shared for a time the fate of many discoveries destined to revolutionise the world. It was ridiculed and discredited. After encountering some opposition, Mr Snodgrass prevailed upon the late Dr Stevenson to allow the experiment of the metallic packing to be tried in the Caledonian steamer, which was most successful. From that day up to the present time no other description of piston has been constructed. Its value is altogether incalculable. It is supposed that in the Clyde alone the saving it has effected in the mere article of tallow amounts to not less than L.20,000 per annum. The importance of the invention has been prodigiously increased by the introduction of the railway system, as the old pistons would have been totally inapplicable to the locomotive. Beyond the barren fame of the invention—

and not always did he receive even that—his sole profit, if we except the premium that was awarded to him in 1825 by the Glasgow town council, from Coulter’s mortification, consisted in his being employed to manufacture some fifty metallic packings at the rate of 5s. per inch of the diameter of the respective pistons. In the course of his long and laborious life he introduced a variety of minor improvements in machinery, many of which continue, we understand, in general use. Among these we may mention a new application of the Mendoza pulley and wheel for leading out the mule-spinning carriage; a new plan of skeleton bars for furnaces; and an apparatus for the prevention of smoke on the Argand principle. Mr Snodgrass also claimed to have anticipated Mr Dyer of Manchester by two or three years in the present arrangement of the tube roving frames, for which the latter obtained a patent by which he is said to have cleared L.50,000.

SONNET—RASH OPINIONS.

BY CALDER CAMPBELL.

We judge too rashly both of men and things,
Giving to-day’s opinions on the morrow
Utter denial, while we strive to borrow
Hollow apologies that—like the wings
Of butterflies—show many colours. Sorrow
Hideth its tears, and we disclaim its presence
Where it hath deepest root; Hate softly brings
A smile, which we account Love’s sweetest essence;
Simplicity seems Art; and Art we deem
White-hearted Innocence—misjudging ever
Of all we see! Let us, then, grant esteem,
Or grudge it with precaution only; never
Forgetting that rash haste right judgment mars:
What men count but as clouds may prove bright stars!*

* Earl Rosse’s telescope proves that what were deemed nebulae, are in reality clusters of stars.

CRUELTY TO ANIMALS.

In a certain town, a miserable wretch was lately brought before the magistrates charged with having cruelly beaten his jackass. The evidences for the prosecution were a gentleman and two gamekeepers. The gentleman saw the prisoner beat his jackass cruelly, and the two gamekeepers corroborated the fact. ‘Now, man,’ said the presiding magistrate, ‘what have you to say for yourself?’ ‘Why, please your honour, I was in a hurry; the ass would not go, so I beat him; that’s all, and he’s used to it.’ The magistrates were shocked: one of them made a touching speech on the cruelty and cowardice of ill-using poor dumb creatures—and the culprit was fined the full penalty. A gentleman then said to the man who had been fined, ‘Why, John, I thought you had something to say touching cruelty to poor dumb animals?’ ‘Oh, sur, you means about them gins or steel traps; well, if I shall not get into harm by offending the bench, I will tell what I saw the same morning I was cotched wallopping my donkey. I was in — wood, picking up a few sticks; ’twas just daylight; when I heard something cry and squeal; and I went up to the place not fur from the higher hedge of the wood, and saw a rabbit caught by the leg in a gin; a few yards further was a pheasant; and a little further a fox, which was trying to bite his own leg off, all caught in gins, and all alive: just at the moment I heard voices, and hid myself. When they two gamekeepers came up, one said, “Poorish luck to-night, only ten rabbits and four pheasants; but here is another rabbit and a pheasant.” They then saw the fox: “We must bury that,” says one to the other, “or there will be a row about it.” They then knocked the fox on the head, bagged the rabbits, and pocketed the pheasants, and whilst they were earthing the fox, I stole away to my Neddy.’ ‘Now, gentlemen,’ exclaimed the advocate, ‘this is a strong case of cruelty, so many poor innocent creatures made to suffer torture so many hours. Gentlemen, ye have fined, and justly too, yon poor fellow for cruelty, now punish those two gamekeepers with severity for acts of most atrocious and barbarous cruelty.’ The magistrates hem’d and haw’d, consulted among themselves, said there was no precedent, and left the hall.—*Plymouth Herald*.

METAPHYSICS OF PARTY.

IN all states where the popular voice is heard, there is a divarification of the people into parties. It seems to be an unavoidable consequence of deliberation on their part that a diversity of view arises, under which they commence pulling different ways. It usually depends on external circumstances which of the two sets gives the actual direction to affairs. It is a mistake, however, to suppose that the entire population is divided into parties. It is only in extraordinary circumstances that even an approach is made to an involvement of the whole people in controversial politics. The actual partisans are usually but a handful on each side, while the great mass remains in the centre with a comparatively dull sense of what is going on, and little disposition to interfere, although liable to be to some extent affected towards one view or the other, according as arguments are successfully addressed to them, or circumstances arise to enforce their attention to public questions, to excite their prejudices, and to awaken their hopes and fears. It is this torpor of the mass which forms the great difficulty in democratic arrangements. In tranquil times they would rather not use their votes. In times of excitement, the use to be made of these votes depends almost entirely on the dexterity with which popular prejudices are addressed by unscrupulous members of the thinking handful; whence of course disappointments, despair of progress, patriotic heartbreak, and many consequent evils.

In that intelligent and active portion of a people which becomes inspired with party feelings, it is curious to study the various causes which determine particular predilections. What may be called the natural bases of partisanship are readily traceable. Some minds are from the cradle venerative of authority, and through life continue ready to submit to it, and to exert themselves for its support. Others are congenitally jealous of power, indisposed to yield to it, and eager to keep it in check. Here are the two great sources of loyalty and Jacobinism. Some minds look with a romantic tenderness on what is old; they love to wander back into the past, and regret whatever tends to produce a change in the ancient landmarks. Others, again, are all for the romance of the future. Change is to them a continual subject of hope. The present does not satisfy them; the past they despise. Here are the two great natural sources of conservative and reforming politics. Some minds, again, are intolerant of whatever is not clearly useful, expedient, and economical. Others regard such matters with indifference or with contempt. The former have a satisfaction in viewing the means of promoting the benefit of the community. The philanthropy of the latter never gets beyond the particular case of some friend, or dependent, or any individual

casually brought under their attention. Here, it is equally evident, are the natural origins of the politico-economical reformer and his opposite. Now though there are three sets of characters brought here into contrast, they are all in general resolved into one set of persons. Jealousy of power, hopefulness of change, and love of the economical, are attributes usually found in one person, as the opposites also are, though perhaps not all found at the same time, as it is not always that there is occasion for the development of the whole set of feelings at once.

There are, however, secondary and modifying circumstances. Where the natural tendencies are not of a very resolute character, they will be much affected and biassed by parental authority and example, and the force of external circumstances generally. They will also, even in pretty strong cases, undergo a change in the course of advancing years. Thus he who begins with romantic feelings in favour of authority and antiquity, is often seen, as he grows soberer, and acquires more solid, as well as more extensive views, to pass wholly or partially into the opposite range of politics. He who began with ardent hopes of improvement from change, is often, in like manner, disenchanted in his middle or elderly life, and becomes fain to own that things which he once thought wrong may have an intermediate bastard utility not altogether to be despised, while as yet society is composed of a mixture of the civilised and savage. Then there is a set whose general determination is apt to be affected by whims, crotchets, or views of interest. Thus we sometimes see a neighbour range himself on the conservative side, not exactly because he primarily tends that way, but because the opposite system has awakened some antipathy in his nature. Popular causes, though often invested with a certain sublimity, are more generally liable to vulgar associations. The cant, the clangour, the dust and sweat attending them, are repulsive to a fastidious nature; while, on the other hand, the select few ranged in opposition appear gentlemanly, gallant, almost martyr-like. In this way many fine spirits are lost to great movements, both in politics and religion. A mind, too, which is in the main of liberal inclinations, may betake itself to the opposite banners because of something in its own position which brings it painfully into collision with authority. An arrogant father or master will sometimes send one of nature's conservatives to the camp of the enemy. A proud spirit, chafing in an unworthy situation, looked down upon by reputedly superior classes, while conscious of that within which ought to annul all social distinctions, will often take the rebellious side in despite of the first intention of nature.

Among this class of causes there is obviously none more powerful than the selfish feelings. It is a mistake, however, to suppose that men are to any great

extent bought by actual money or by prospects of advancement. The chances on both sides are much alike in these respects. Purchased partisanship was a feature of grosser ages, but scarcely of ours. People are now more liable to be gained or lost through their self-love and love of approbation. A man thinks he is of some value: if courted to the extent of his sense of this value, he will perhaps give his support; if neglected, he will be apt, out of pique, to go to the other side. A very small matter in the way of courtesy will often not merely obtain a vote, but determine a career of some importance to the public. It is not that there is a want of conscientiousness in such minds. They are merely irresolute in the midst of contending arguments, and liable to be taken to that side which shall place them on the most agreeable footing with themselves. Once let any petty circumstance decide the way which they are to take, and the personal feeling, 'This is *my* side,' will keep them as upon a line of rails through life, or till something equally petty shall occur to disgust them with their party.

All of these causes may be said to be alike natural, though all cannot be considered as alike respectable. Where one's line of politics is determined by innate tendencies of the mind, apart from all selfish considerations, the whole range of action which results, as far as bounded by rules of honour, is entitled to public respect. It is all that we have of the nature of a Divine voice speaking in the breasts of men. Therefore, no matter how inconvenient the dictates of this voice may appear, no matter to what consequences it may threaten to lead, it must be respectfully listened to and intreated. To call the ultra-loyal by any such appellation as Malignants, or the ultra-liberal by such a term as Destructives, is not to be approved of by those who are out of the heat of the strife. Let there be as much activity of counteraction by argument as possible; seek by all means to establish the supremacy of what you believe to be better doctrines—but spare the fellow-creature who acts under the resistless necessity of his own lights, believing him to be, in intention, as good as yourself.

When we come to consider the secondary or modifying circumstances, we feel of course more at liberty to assign degrees of merit and demerit. The mind which has been affected by educational influence, or yielded to the authority of others, even though these may have been persons generally entitled to reverence, cannot be considered as quite on the same moral platform with one which obeys great primitive impulses inherent in itself. Those who have changed their views with advancing years, alike true to the natural voice at the one time as the other, ought of course to be carefully distinguished from common renegades. The victims of crotchet and of petty feelings of self-love may be pitied, but we can never esteem them. They ought to have reflected on the great interests at stake, and not allowed themselves to be swayed by trivial considerations as to themselves. It is of importance to pass rigid judgment on such persons, because they often have from the rest of their character a high claim to respect. They may have, for instance, great talents. Common thinkers argue that because this is an able man, his word ought to go a great way. It is important to see that, while this would be true of an able man whose mind was clear to form sound conclusions, it is not true of one who has allowed himself to be carried out of his proper track by some romantic whimsey, some disgust at a successful rival, or some pique arising from his finding that his own estimate of himself was not admitted by the party to which he first seemed inclined to attach himself. It is one of the most distressing things in the world of politics to see a man who, from some such frivolous cause, has thrown himself into a false position. His energy and eloquence are hampered at every turn by his own secret convictions. He has to act, with affected cordiality, with those whom in his heart he despises. Should he have given himself to a failing cause, as very often happens, he is doomed to see his best talents

expended in vain, to feel himself growing old without having accomplished anything, while inferior but better-directed men are reaping their due harvest of both profit and honour. These are amongst the moral suicides of the able men of the world. How powerfully do they warn us that we are not to be guided in any of the greater affairs of life by the selfhood, but by its opposite—a generous view of what is good for all!

It is difficult, or rather impossible, for some natures to maintain coolness in times of violent political excitement; but to many it may not be altogether useless to remind them that the most earnestly-cherished dogmas are liable to be followed by great disappointment. The French revolutionist sees his high aspirations for a rule by and for the people lead resistlessly to a despotism. The panic-struck conservative sees nothing follow from the changes which he vainly resisted, but a ridiculous falsification of his fears. If men would reflect how often the result has been different from that contemplated on either side, there would be on the one hand a soberer hope and a less intolerant feeling towards all thwarting influences, on the other a more cheerful trust in the course of Providence, even under what appear the most trying crises. Few politicians of any shade seem sufficiently aware of the character of that great central mass which has been already described as non-political. There, in reality, resides that which defeats alike the hopes of democratic and the fears of oligarchical parties. It is a mass which refuses to be democratised. It minds its own affairs, content with whatever rule may be over it, unless it be one which makes itself painfully felt indeed. Go beyond the capacity of change inherent in this mass, and you must come back again to where you were. Give it true cause of discontent, and it becomes an element of great danger, though one which cannot long remain in such an attitude. The great secret of successful rule is never to offend irremediably this true *squadrone volante* of parties, never to resist it beyond a certain point, and never to lose faith in it as a mass which can only be temporarily thrown out of its proper condition, as that which gives at once momentum and stability to the entire machine.

THE CORNER HOUSE.

A SUBURBAN SKETCH.

BURNHAM TERRACE has always enjoyed a reputation for gentility. It consists of ten houses, each let for the respectable sum of a hundred a year; and its lady inhabitants, of whom I am one, rather take a pride in seeing that everything is kept in high order about the place. No encouragement, for example, is given to peripatetic venders who bawl out the names of their articles; the slip of enclosed ground in front common to all the dwellers, is as neat as a hired gardener can make it; and the door-steps are hearthstoned freshly every morning. All things have gone right with Burnham Terrace except No. 10, the house at the northern corner. That corner house was for years an annoyance and a mystery.

No. 10 was the property of a lady called Miss Delany, and so was No. 8 and No. 9—a large mass of building worth three hundred a year; and at least as regards my house, No. 8, and that of Mrs Smith, No. 9, well-paid money. What kind of person the proprietrix was we had no means of forming a correct judgment. We never saw her, though we heard that she lived in some obscure out-of-the-way place in a most penurious, and, for a woman with three hundred a year, a very eccentric way. Her strange method of living was considered the less proper, on account of her having a brother a judge. The only shade of excuse ever offered for Miss Delany was, that No. 10 had on several occasions stood for a short time empty. It had so frequently changed inhabitants, that there seemed to be something unlucky about it; and yet it was as good a house as any in the row. This changeableness was not liked by the residents in the row generally. People take a

grudge against a house which occasionally stands empty, and has not its windows and doorway cleaned regularly.

One morning, after cook had received my orders for the day, she paused as if she had something to communicate; and to my 'Well, Sally, what is it?' replied, 'Oh, ma'am, what do you think? A lady has come to live in No. 10! Her furniture came last night in a donkey-cart; and the milkman called with his milk this morning.'

'Furniture in a donkey-cart! Sally, you must be dreaming.'

'Not at all: No. 7's servant told me all about it. She saw a deal-table and a bed brought to the door; and the lady was there to take them in.'

'And who is the lady?'

'I hear it is Miss Delany herself, the landlady. But surely it cannot be her, as it would be so strange!'

Strange indeed, and not less strange than true. The intelligence spread, as if by electric telegraph, through all the houses in the terrace; and their organs of wonder were excited to a surprising degree. Several ladies suddenly bethought themselves of going to view the corner house; 'they had friends who were looking out for a residence of that kind in the suburbs.' Mrs Smith, my next-door neighbour, as much interested as the others, persuaded me to call at No. 10, just as we were passing for a morning walk; 'not from curiosity,' said she, 'but merely because I have friends, the Petworths, who are looking out.'

Mrs Smith's loud triple knock reverberated through the desolate mansion; and the door was opened by a young fair-haired girl, who preceded us through the house. She was a pretty modest creature, of about fourteen years of age, plainly dressed, but scrupulously clean. After we had mounted to the attics, and descended again, having visited every apartment except the dining-room, which opened from the hall, the little girl hesitated as we approached that room, and slightly colouring, asked if we desired to view that also? 'Yes, certainly we do,' peremptorily exclaimed Mrs Smith: 'it is of the first consequence,' winking to me, as much as to say, 'Now we shall at last hunt out this shadow, and see if Miss Delany is flesh and blood.'

I must do myself the justice to say that I hesitated; but with the view of neutralising any abruptness Miss Smith might be guilty of, I followed her into a large front room—the dining-room of the house. There was a small bright fire in the grate, a strip of carpet placed where a rug usually is, and a wooden table and two chairs before it. A stump bedstead occupied one corner of the apartment, and nothing else was visible; for no doubt other necessities were stowed away in the spacious closets on each side of the fireplace. Perfectly well-ordered and exquisitely clean were the simple arrangements, giving even a habitable appearance to that dingy bare apartment. The wooden table was covered with books and needle-work, and a female rose from beside it as we entered. She was a small, pale, middle-aged woman, clad in coarse stuff habiliments, her placid face surrounded by the close crimped border of a primitive Quaker cap; but it was one to arrest attention, from its peculiar sweetness of expression; while *lady*, in the best and truest acceptation of that often misused term, was stamped on this individual in unmistakeable characters.

'Have I the pleasure of addressing my landlady, Miss Delany?' said Mrs Smith advancing.

'I am Miss Delany,' quietly answered the little lady; 'and I presume that I am addressing one of the two ladies who have tenanted my two houses, Nos. 8 and 9, for many years?'

'You are perfectly right, Miss Delany,' rejoined Mrs Smith. 'I occupy No. 9, and I am glad to have the opportunity of becoming acquainted with my landlady personally. Your little attendant has shown us over the house, which I wished to see on account of some friends of mine.'

Miss Delany kept her eyes steadily fixed on Mrs Smith, which somewhat disconcerted that voluble lady, during the latter part of this speech, and her voice sank in faint accents ere she concluded.

'This child is not my attendant, madam,' said Miss Delany, 'but my niece and companion; and it is fortunate for me that the ladies of Burnham Terrace have so many friends looking out for houses just now. I hope, amongst them, I may succeed in letting this: it has hitherto been unlucky; as they say corner houses often are,' added the speaker smilingly.

'I am sure, Miss Delany, I shall be happy to do all in my power to forward your letting it,' said Mrs Smith, 'if it were only on account of the high respect I bear for the public character of your brother the judge.'

I observed a singular expression flit over the listener's pallid countenance, but it was too transient to be studied by the mere looker-on; and Mrs Smith continued, 'But I hope you do not think of remaining here during the winter in this uncomfortable manner?' looking round as she spoke.

'We are not uncomfortable, madam,' was the quiet answer; 'and it is my intention to occupy my dwelling until I succeed in meeting with an eligible tenant.'

'Well, Miss Delany, if such is *really* your intention,' rejoined the hospitable Mrs Smith, 'I hope you will drop in and take a cup of tea in a friendly way at my house very often. I am sure we shall all be happy to add to the comforts of a lady like you, particularly for the sake of the learned judge, your excellent brother; and I hope this dear girl will come too. And what is your name, my child?' said Mrs Smith, meaning to be winning and familiar, as she turned towards the blushing niece.

'I am called Lily, ma'am,' answered the young girl, hanging down her lovely head.

'Lily! dear me, what an odd name!'

'Lilian Traher is my niece's name, madam,' interrupted Miss Delany gently. 'Those who love her have given her the pet one of Lily. Do you think this house likely to suit your friends, madam?' she added suddenly, causing Mrs Smith to start slightly. 'Perhaps you will let me know: it is of great moment to me, as my subsistence and that of this child entirely depends on its proceeds.'

'Oh, Miss Delany,' broke in Mrs Smith, determined now or never to penetrate this mystery, 'have you not a good clear L.200 a year from Nos. 8 and 9 that we know of? I am sure your rent is paid to the day: allow me to remark it is *very* peculiar—to say nothing more—your mode of living here—a lady like you, with a judge so distinguished for your brother: pray allow me to remonstrate.'

Miss Delany glided towards the room door, and held it open in her hand, as she mildly said, 'My morning hours, ladies, are valuable, being devoted to instructing my niece; therefore, will you permit me to plead my engagements, and not think me uncourteous for saying good-morning?'

We found ourselves on the terrace, gazing at each other, quite amazed at our easy dismissal, and ejaculating that it was strange—'passing strange.'

'If she is a miser,' quoth I, 'she is the sweetest and kindest-looking one I ever imagined. I examined some of the books on the table when you were speaking, and their studies are apparently not those of crooked or illiberal minds: and that sweet young girl, too, how lovingly she watches her little aunt,' pursued I half to myself: 'no selfish, miserly being *could* have won her guileless affection. No, no; I can put two and two together as well as most people, Mrs Smith; and though there is a mystery here, it is nothing discreditable to Miss Delany, I am certain. She is perfectly a lady; and it is melancholy to see her thus—for so often as that unlucky house has been empty, what straits she must have been put to—for you know she plainly told us that she depended on the rent of it for daily bread.'

'Well, miss, all may be as you say,' said Mrs Smith. 'You are always on the charitable side: but I cannot

make it out: living in an empty house to save a few shillings a week for a lodging!

'A few shillings must be a great object to her,' answered I, 'when she has so little, and that little so uncertain: we must try all we can and be kind to her, poor thing!' But proffered civilities and attentions on the part of her neighbours were gratefully but decidedly declined by Miss Delany for herself. There was a large family of children in No. 7, and they had made acquaintance somehow with Lily, according to the freemasonry inherent in the young among themselves; and at the merry Christmas tide, so beseeching were their intreaties that she might be permitted to join their circle, it was not in human nature to refuse, much less in Miss Delany's. Then on Twelfth Night, all the little people assembled at my house, and I pleaded successfully for my favourite Lily, and she came too. Delicacy prevented my questioning the artless girl relative to her aunt, their mode of life, or any other information I might gain. But Mrs Smith's curiosity overcame such feelings, and she examined my pretty guest in a manner I quite disapproved of, though without elucidating aught that tended to throw light on the matter. Lily said that she had resided with Aunt Marjory for four years; in the same lodging for half that period at the Potter's cottage; and elsewhere in a secluded farmhouse. She had many brothers and sisters 'far far away,' she admitted, with tears standing in her large blue eyes—a father and mother too. She had never seen Uncle Delany, but she knew him by name very well; and she was—'Oh! so happy, and loved dear Aunt Marjory, oh! so much!'

Now all this amounted to 'nothing,' said the vexed questioner; 'And it does not tell us *what* Miss Delany does with her money. Are your papa and mamma rich, my dear?' said the persevering lady to Lily.

'Rich, ma'am; what is being rich?' simply demanded the little girl in reply.

'Why, keeping a carriage, and servants, and living in a large house to be sure, you stupid little soul!' exclaimed Mrs Smith laughing.

'Then, ma'am,' said Lily, 'father and mother are not rich, for they live in a small thatched cottage; but there are beautiful roses and eglantine round the old porch, and they only keep a wheelbarrow, and are their own servants.'

'O—h!' exclaimed Mrs Smith. This was a complete sedative; and presently she whispered to me that Miss Delany's relatives were low people, notwithstanding she had a judge for her brother.

The first days of spring came, and still was the ticket to be seen at the corner house, and the friends of the Burnham Terrace ladies, it seemed, were difficult to please. I ventured occasionally to look in, for the ostensible purpose of leaving flowers and fruit, the products of my garden, for little Lilian; and Miss Delany seemed pleased and grateful, yet cold and distant in her bearing, on any attempts being made at further intimacy.

There were two factions in the row; one for, the other against, Miss Delany: the latter, and, it must be confessed, the largest and most influential, reviled her as a mean creature, or a mad woman. 'She *must* have done something,' said they, 'to disgrace herself, or the judge would not cast her off: it is a shame of her to keep that beautiful girl in the miserable manner she does. No wonder the house will not let; *she alone* is enough to give it a name for ill-luck!'

Miss Delany's friends, and they were few, spoke of her blameless life, resignation, and patience in the midst of privation and poverty; to say nothing of her devotion to the niece, who would reflect credit on any teacher. These friends also threw out hints that although Judge Delany's character and talents in his public capacity were so fully admitted, in private life he was not remarkable for amiability or benevolence.

Such a discussion as this was one evening going forward at a neighbour's house when I was present, when an elderly gentleman of the name of Colville, who had

that evening arrived on a visit to our host, for the *real* purpose of house-hunting on behalf of a son about to marry and 'settle in life,' hearing the name of Delany repeatedly mentioned, asked if we were speaking of Judge Delany; and when an affirmative was given—a slight sketch also being thrown in relative to the occupant of No. 10—Mr Colville became interested in the conversation; and, to our amazement, on a non-admirer speaking disparagingly of the lady, he warmly advocated her cause.

'I happen,' said he, 'to know all about Marjory Delany and her affairs, and I tell you that she reflects credit on her sex.'

'Oh do tell us all about her!' eagerly exclaimed many voices, as a crowd gathered round the stranger. But the pleasant old gentleman smiled, rubbed his shining bald head, and only adding that it was not 'convenient' to say more just then, left us all with curiosity more excited and tantalised than ever. However, he managed to ask me privately every particular I knew concerning Miss Delany; and next day he went alone to No. 10; the ticket was taken down; the house was let to Mr Colville's son.

Miss Delany and Lilian disappeared as quietly and expeditiously as they came; and in due course of time Mr Peter Colville and his bride arrived to take possession. When the young couple settled down into the jog-trot routine of respectable married life, old Mr and Mrs Colville came to visit them for a few weeks; and then were tea-junketings and whist parties every evening at one or other of the neighbours' houses; and to return all this hospitality, young Mr and Mrs Colville gave an entertainment on quite a grand scale. We were collected round the supper-table, pleasant jokes passing, when some one alluded to the corner house, trusting the ill-luck had flown away, and the bride's presence turned the scale in its favour.

'Nay,' broke in old Mr Colville, 'if *that* were needed, it has been already done—purified—exorcised,' he continued, laughing heartily at his own conceit, 'from all evil influences.'

'How so?' we exclaimed.

'By the presence of Marjory Delany,' said he gravely; 'one for whom I bear a higher respect than for any woman I know; saving and excepting *you*, my dear,' turning with a kind smile to his comfortable-looking wife, who nodded to him cheerily in return. 'Marjory is about to be your neighbour again,' Mr Colville went on to say, addressing the company generally, 'for she has taken Burnham Beech Cottage!'

'Dear me!' said Mrs Smith, 'how can she manage that on L.100 a year, secure as it is *now*?'

'She has recovered her property, madam,' answered Mr Colville, 'after ten years' heroic endurance of privation and want. Yes, actual want, for the sake of others too.'

'Oh, do tell us her history, and why the judge disowns her!' cried many voices.

'I am not at liberty to enter into all the details,' said the old gentleman, 'but, for the sake of suffering innocence, thus much I will unfold:—Sixteen years ago, Marjory Delany's only sister, whom she tenderly loved, made an imprudent marriage, against the express advice and wishes of her brother, her natural guardian. The individual she united herself to was in a mercantile house; but within six years after his marriage with Marjory Delany's sister, he forfeited his situation through misconduct; and had it not been for the faithful affectionate sister, the unhappy man's ruin and that of his family would have been complete. She alone came forward to assist these perishing creatures; for Judge Delany not only was implacable towards *them*, but extended the same baneful feelings to *her*, on her refusal to disown the sister so fearfully punished for her imprudence through a husband's misdeeds. Silently she has borne reviling and contumely cast upon her by a harshly-judging world. But let it be a lesson to you all, my friends, for the future, never to prejudge others,

but to learn both sides of a question fairly ere you form an opinion.'

'But, my dear sir,' said Mrs Smith, 'I do not see why poor Miss Delany should have been so *very* liberal, even in a Christian point of view—giving *all* her income away to these relatives, and leaving herself only an uncertain pittance, besides maintaining her niece.'

'Madam,' replied Mr Colville, 'all Miss Delany possessed in the world of her own were the three houses on this terrace left her by an uncle; her sister was peniless, and entirely dependent on her brother the judge. Ten years ago, Marjory Delany became bound to pay £200 a year for a term of fourteen years, interest included, for her brother-in-law Mr Traher. The two houses in the terrace, Nos. 8 and 9, were therefore not at her disposal during that term; but not only did she sacrifice the income derived from them, but out of the scanty pittance reserved for herself she assisted her relatives, and, as you have seen, supported and educated one of the children. She has just been fortunate enough to obtain a release from her debt, which otherwise would have burdened her for the next four years.'

'God grant this excellent lady may long continue to enjoy her £300 a year, nor ever want good tenants for her houses!' said I. 'But is Mr Traher unreclaimed, and does he eat the bread of idleness while this lone woman is making such noble sacrifices?'

'No, madam; I am happy to say he does not: he has seen the error of his ways, and labours even with his hands to aid in supporting his family. But be sure a good portion of Marjory's income, restored as it now is, will find its way to the poor outcasts, for she is a capital economist.'

In process of time Mrs Peter Colville and myself became extremely cordial, and she related to me some further particulars respecting Miss Delany, which her father-in-law had omitted—worthy, benevolent man, not liking to speak of his own good deeds. He had been a partner in the mercantile house where Mr Traher was employed; and when it was discovered that this young man had defrauded them to the amount of some thousands, Mr Scrape, the senior partner, determined that the law should take its course; and transportation, perhaps worse, seemed inevitable. Fortunate it was that the matter *could* be hushed up; and the prayers and intreaties of Marjory Delany prevailed, and softened even the obdurate heart of Mr Scrape. She became bound, as already told, securing the property to the firm until the debt was liquidated. Often had the worthy Mr Colville wished to lessen this burden, but his wishes were overruled; and it was only on Mr Scrape's retirement, and the introduction of Mr Peter as junior partner, that his father found himself at liberty to indulge the dictates of his heart. His visit to our neighbourhood decided the point at once; and if he had been interested in Miss Delany and her affairs before, he became doubly so now. The debt was immediately cancelled—the corner house taken; and I may here as well remark, it has been the luckiest house in the row ever since—a lovely family, prosperity and happiness, having entirely dispelled the dark shadows haunting it heretofore.

About two years after Miss Delany had been settled at Burnham Beech Cottage, another fair niece being added to her circle, one of the sweet Lily's sisters, she learned the sudden decease of the judge; and gossip being rife respecting his affairs, it was soon known that he had left half his fortune to public institutions, but the other half to his sister Marjory; thus making her amends in death for his cruel conduct during life.

It were almost needless to add how gratefully Miss Delany disbursed the remainder of her bond to the firm of Colville and Son. Two of her nephews, the young Trahers, were received into its employment, and are thriving steady youths.

As to the dear Marjory herself, she goes on her way in quiet usefulness, though her two beautiful nieces attract so many visitors to Burnham Beech Cottage,

that her retirement is invaded oftener perhaps than she would choose. Her visits are restricted to the corner house, and Mr and Mrs Peter Colville are her most intimate and valued associates; for my part I hope the lesson we have all received at Burnham Terrace will be a warning not only to ourselves, but to many others, to suspend their judgments of their neighbours.

THE SUBMARINE TELEGRAPH.

THE recent experiments with regard to the submarine electric telegraph should be more generally known than they are, for they may be said to be the rudimentary efforts at realising one of the grandest conceptions of the age—a power of instantaneous communication to the uttermost ends of the earth.

The experiments, which took place on the channel at Dover, were attended by many gentlemen of science, desirous to witness the results. The arrangements and plan of operations were under the direction of Mr Walker, the superintendent of the electric telegraph on the South-Eastern Railway; and one of this company's steamers was commissioned to assist in carrying out the undertaking. The principal object of the experiments was not to carry a telegraphic wire across the Channel, but simply to prove, on a sufficiently great scale, the practicability of such a system of communication with the continent. To this end, there was placed on the deck of the steamer a sufficient length of prepared wire; it being considered that if the telegraphic intercourse proved to be perfect through that wire when submerged in the water, there existed no *a priori* reason for doubting that the same result would follow even though the wire were prolonged to the opposite coast. Unfortunately, the weather proved most unfavourable to the experiments as intended to have been performed by aid of the steamer. The wind rose in the night; and continuing to blow smartly on the morning of the day fixed, the swell became so great, that it was not thought possible to conduct the experiments on their original plan. The steamer was to have steamed out to sea for about two miles, 'paying out' the wire in her progress, and then to have been hove to, so as to give her passengers the opportunity, as she lay embosomed in the still waters, of a little conversation with the busy metropolis. The ruffled state of the sea set aside this project, since it was feared that the roll of the steamer would endanger the safety of the wire, and that telegraphic intercourse would have been in another way rendered impracticable, in consequence of the unsteadiness of the indicator-needles. The wire, however, was transferred from the steamer to a small boat, and by that means a length of upwards of two miles was submerged in the sea along the mouth of the harbour, and at the side of the pier. One extremity of this sunken coil was then put in metallic union with the wire, the end of which was in London, and the other extremity was connected to the electro-telegraphic converser placed on the deck of the steamer lying in the harbour. A sand galvanic battery of six dozen plates, weakly charged, in the usual manner, with dilute acid and water, was then placed in connection with the wire through which it was to send the mysterious agent of the telegraphic tongue, and all things were now ready to solve the problem of submarine intercommunication. It was about noon when all the arrangements were completed: the communication was then made; and instantly, in the far-distant London station, the clatter of the electric alarm informed the chairman of the company that the experiment was crowned with perfect success. Messages of congratulation were passed up and down with complete facility, the fact of more than two miles of the conveying medium being buried in

the depths of the sea, exercising not the least influence upon the freedom and rapidity of the conversation. A continued correspondence was then kept up between the steamer and the stations of London, Ashford, and Tunbridge, which was continued with perfect success at intervals for three or four hours, messages of various import being interchanged between the steamer and all those stations. The bells at the electric-telegraph offices at Tunbridge and London Bridge were vehemently rung by the operators on board the steamer; and the various signals and interlocutory manœuvres peculiar to the conversers on these instruments were gone through with as much ease by means of the submarine wire as with the ordinary wires disposed by the rail-side on land. The exact total length of the submerged wire was 3600 yards. Before dark—the experimental trials having been continued a sufficient time to demonstrate the success of the investigation—the submerged wire was wound up, and drawn in again, and was found not to have sustained the least injury, the assembly of scientific gentlemen separating with the conviction that, so far as these experiments went, the practicability of a telegraphic communication between England and France had been completely established.

Bearing in memory that water is a good conductor of electricity, and that consequently the perfect insulation of the telegraphic wires cannot be effected unless by surrounding them with some non-conducting material, it will be readily conceived that here must be the chief difficulty of submarine communication. In conveying the wires of the electric telegraph through tunnels, much practical inconvenience has arisen from the same cause, the damp continually carrying away a portion of the current from the wire into the earth. In addition to this annoyance, the sulphurous acid and steam rising from the locomotives produce a chemical action on the wires, which materially interferes with their usefulness. To meet these objections, various plans have been devised of more or less ingenuity: some have recommended covering the wires with woollen yarn, varnish, &c.; and it has been proposed to convey them in tubes of earthenware, perforated with four or five holes lengthways, according to the number of wires proposed to be employed. Mr Walker, of the railway in question, had the defects in existing wires presented to him constantly in a most disagreeable manner. Despatches from the continent being now almost entirely transmitted by electric telegraph to the morning papers, the messages became next to useless to the editors, unless passed up very quickly, and the wires in the tunnels were only too often in a very refractory condition. He accordingly put himself in communication with the manager of the gutta-percha manufactory at Streatham, and suggested to him the adoption of a metallic wire well coated with this singular substance. In a few days the wire was supplied, and patented; and shortly afterwards was put to a practical test in one of the tunnels with the most complete success. Subsequently it was introduced into the Shakspeare, Abbot's Cliff, and Martello tunnels; and at the present time all despatches to and from the metropolis are made by the instrumentality of this wire.

The defective insulation of the wires, against which this new wire has so successfully provided, has been the only serious practical difficulty in working the electric telegraph. It may be thought, however, that sufficient time has not yet been given to put the capabilities of the improvement to a proper test. Mr Walker says, 'I have had specimens of this wire buried in the earth in a damp place for more than a year.' It is sound and good still. Specimens have been immersed in sea-water for three or four months, and are unaffected.' It has been suggested also, that perhaps, in process of time, the continued action of sea-water, with its combinations of the chlorides and iodides, may destroy the powers of this coating of vegetable substance for insulation; but much weight is not to be attached to the conjecture, since gutta-percha has exhibited, in all the investigations to

which it has been submitted, a marked indifference to the operation of the most powerful chemical reagents. Its insulating properties are indeed altogether peculiar, and far surpass those possessed by any other substance with which we are acquainted; and this, together with the facility with which it is manipulated and applied to the wire, renders it in all respects a most valuable application for the purposes of electric intercourse. Professor Faraday has instituted an important series of experiments upon this substance, and these have shown that insulation effected by its means is one of the most perfect known to philosophy.

Mr Walker proposes the following as the plan he would suggest for uniting England with France by the electric cord. Between each port—say Dover and Calais, or Folkestone and Boulogne—he would lay down two or three wires. These wires would be run out in different tracks across the Channel; and by this means, and by not making the communication dependent at either port upon a single wire, the probabilities would be greatly against their being all broken or damaged on the same day. In the event of one of the wires being injured or broken, notice of the accident would be instantly given by the refusal of the wire to act; the spare wires would now come into activity, and little or no delay would take place. Meanwhile one of the South-Eastern Company's steamers would fish up the damaged wire until the seat of the injury was discovered; when its repair would be the work of probably a very little time, and all would go on as before. So confident does Mr Foster, the patentee of the wire, feel as to ultimate success, that he has signified his willingness to provide the gutta-percha necessary for coating a wire of sufficient length to stretch across the Channel, whenever the directors of the railway consent to supply the wire.

It cannot be denied that difficulties of a formidable kind threaten the invention. One is the danger of the fracture of the wire: it may be caught by the fluke of a ship's anchor, as she is endeavouring to ride out a stiff gale, and thus dragged away and broken. Then, again, it is to be remembered that the lower regions of the waters are only unvisited by fish when their depth is far greater than that of the Channel, and these monsters of the deep might happen to take a fancy to the long body of the wire, and by a single effort of their powerful jaws, snap it in twain—perhaps in the very middle of an important official despatch! It may be said, however, that the wire would shortly become so covered with sand as to be secure from these casualties, or from the last; and in portions of its length, undoubtedly, this would be the case. But across the depths and uneven hollows of the bottom, the wire would still lie fully exposed to this danger. The proposed remedy has been already discussed: it being to lay down two or three separate wires, by which means the amount of the risk to the intercommunication is considerably lessened. A serious cause of inconvenience may also be found to arise from accidental injuries to the coating of the wires, which, though slight in themselves, might expose a portion of the metallic surface to the conducting medium around, when the practical working of the wire would be almost as effectually interfered with as if it had been cut across with some sharp instrument. Add to these the suggestion that the gutta-percha may in process of time undergo chemical transformation, and we have probably enumerated the most formidable of the obstacles which the submarine telegraph is likely to meet with. The history of a thousand inventions in modern times presents us with practical difficulties more formidable in their kind and amount than any or all of these, so that a good hope may be cherished that these too will in time give way before the persevering energies of our enlightened age.

It is satisfactory to be able to point to an example of submarine electric intercommunication, which has hitherto answered every reasonable expectation: this is the wire from Gosport to the dockyard. It consists

simply of one line, requiring no other wire to complete the circuit, the water answering as the conducting medium. The wire, surrounded by a rope, in which it is imbedded, was simply allowed to drop into the water, and sink to the bottom. Telegraphic communications are constantly flying through this submerged wire, and hitherto with complete success.

The newspapers are continually telling their readers, or quote the tales from other sources, that such an international communication is being undertaken by this and that inventor, but nothing seems to come of it. It is not long since we were assured that some inventors in the metropolis were about to connect Dover and Calais with the electric wire, and to establish a printing electric telegraph at each port. At the close of the last year permission was actually given to a civil-engineer, by the Lords Commissioners of the Admiralty, to effect a communication between Holyhead and Dublin by means of a submarine electric telegraph. The wires were, or are, to be connected with the lines of railway radiating from the Irish metropolis, and with the Chester and Holyhead Railway. Official assistance is promised to aid in carrying out this undertaking, which is undoubtedly one of great and momentous interest. Since the publication of the experiments narrated in this paper, a monster scheme has been propounded for connecting America with England by these magic-working wires; but until something on a smaller scale has been accomplished, it will be prudent to waive the consideration of a project which is calculated for the time when electric intercommunication, with all its difficulties, shall be a resolved problem.

Arduently, indeed, may the time be wished for when, as one of our wise men has said, 'the earth may be girdled with a sentence in a few moments;' and when, to every civilised nation, a common tongue and a common medium of speech will be given. What new and rapid evolutions of truth may not be expected, what advancement in arts and sciences, what progress in civilisation, when this hour a discovery will be made, and the next will see its knowledge scattered to the 'ends of the earth!' 'Knowledge,' in the words of the sacred writer, 'shall be increased;' and the warring, contending, opposing, and wide-scattered members of the human family shall begin to feel for the first time the reality of the existence of the family relationship. If it is in the order of Supreme Providence that such results should flow even from the humble instrumentality of a copper cord, may that time soon come!

HISTORY OF THE HIGH SCHOOL OF EDINBURGH.

THE histories of places and of local things, when executed with industry and taste, are often both amusing and instructive, from the number of curious matters which they bring out. A history of the High School of Edinburgh, by one of the clergymen of the city, is of this character.* Without any great pretension, it forms a most agreeable narration, embodying what we might call the life of a very distinguished seminary, together with many interesting traits of the persons connected with it, pupils as well as masters, and conducting not a little to illustrate the progress of education.

It now appears for the first time that the High School of Edinburgh is descended from one of those conventual schools which formed the chief seminaries of secular learning in the middle ages: it was originally the school taught by the Augustine monks of Holyrood Abbey; and the first mention of it as the school of the city occurs so late as 1519. It was not till after the Reformation that it had entirely shaken off this early connection, and fallen under the entire control of the municipality. In those days it was settled in a build-

ing at the bottom of Blackfriars' Wynd, which had been successively occupied by Archbishop and Cardinal Beaton. In 1578 it was removed to a new building in the garden of the Blackfriars' Monastery, where it remained, though latterly under a renovated fabric, till 1829. It was there that Scott, Brougham, Francis Horner, and many other eminent men of our age, imbibed the first draughts of polite learning. How many a brave soldier and good civilian in all parts of the world must remember with pleasure the days of happy youthful excitement long ago spent in 'the Yards!'

The purpose of a grammar-school of former times was strictly limited to the teaching of the Latin language. Greek was unknown in such seminaries till a comparatively late period. For a long time, even writing was not taught in the High School. The methods appear to have been far from inviting. For one thing, a pupil, after the first six months, was obliged to speak in Latin, under penalty of a fine. He had to learn the grammar in a Latin book. Thus, by a curious pedagogic absurdity, he was presumed from the first to know that which he professedly came to learn. The doctrines of his faith were also imparted to him in a Latin catechism, which, to complete the solecism of the business, he had to repeat each Sunday in church before an illiterate congregation.

Towards the end of the sixteenth century, corrupted by the barbarisms of the recent civil wars, and partaking of the general lawlessness of society, the boys were addicted to armed rebellion against their masters—chiefly, it would appear, in order to secure that allowance of holidays which they thought their due. In September 1595, being denied a week's vacation by the magistrates, 'a number of them, "gentlemen bairnis," entered into a compact to revenge this supposed encroachment. Accordingly, having provided themselves with firearms and swords, they went, in the dead of night, and took possession of the school-house. On the following morning, when Rollock [the head master] made his appearance, he soon understood that his pupils were there, but that they had another object in view than the prosecution of their studies. The doors were not only shut against him, but every means of access being completely blocked up, and strongly guarded from within, all attempts to storm the garrison were found impracticable, and endeavours, oft repeated, to effect a reconciliation, proved unavailing. At length it was deemed expedient to call in the aid of the municipal power. John Macmoran, one of the magistrates, immediately came to the High School at the head of a party to force an entrance. When he and the city officers appeared in the Yards, or playground, the scholars became perfectly outrageous, and renewed remonstrances were quite fruitless. The boys unequivocally showed that they would not be dispossessed with impunity, and they dared any one at his peril to approach. To the point likely to be first attacked they were observed to throng in a highly excited state; while each seemed to vie with his fellow in threatening instant death to the man who should forcibly attempt to displace them. William Sinclair, son to the chancellor of Caithness, had taken a conspicuous share in this barring-out; and he now appeared foremost, encouraging his confederates steadily to persevere in defence of those rights which he doubtless conceived immemorial usage had fairly established. He took his stand at a window overlooking one of the entrances, whence he distinctly saw every movement of those without. Macmoran, never dreading that such hostile threats would be carried into execution, boldly persisted in urging his officers to force the door with a long beam, which, as a battering-ram, they were plying with all their might. The bailie had nearly accomplished his perilous purpose, when a shot in the forehead, from Sinclair's pistol, laid him dead on the spot. The anxious spectators of the scene were panic-struck, and the mournful tidings cast a gloom over the town.

* Early on the following day the Town-Council held

* History of the High School of Edinburgh. By the Rev. William Steven, D.D. Edinburgh: MacLachlan and Stewart. 1849.

an extraordinary meeting, and gave expression to their deep regret on account of this distressing occurrence, by which they had been deprived of a much-respected colleague, and the city of an active magistrate. The provost, two of the bailies, the convener of the trades, and seven councillors, were deputed to proceed to Fife, personally to communicate the sad intelligence to the king, who was then at Falkland, his favourite hunting palace.

'After two months' imprisonment, seven of the scholars, who were apprehended along with Sinclair, submitted their case to the Privy-Council. In their memorial, they assert their innocence in the most positive terms; complain of being closely shut up with abandoned characters in a damp prison, at the imminent peril of their lives; that, as most of the petitioners were sons either of barons or landed proprietors, they did not consider themselves amenable to the magistrates of Edinburgh, who, besides, being parties, could not sit as unbiassed judges; and humbly intreated his majesty to name an assize, of whom the majority should be peers of the realm. Their request was complied with. What actually took place at the trial, however, is not now known, as the record of the Justiciary Court of that period is unfortunately lost; but Sinclair and the others were soon liberated.

'Here perhaps we may be pardoned for cursorily noticing a tradition, which bears indeed the marks of probability, that a boy of the name of Campbell, implicated in this barring-out, apprehensive of the result, fled alone to the Isle of Skye, where he settled, and left behind him a generation of Campbells, isolated, as it were, amidst a nation of Macleods. One of these, a great-grandson of the rioter, hospitably received the unfortunate Charles in his wanderings in the year 1746, and was very kind to him. Some other boys, the sons of Highland chieftains, were engaged in the affray, which proves that the Highland proprietors of that period could not have been so illiterate as it is generally supposed they were.'

We have heard that poor Macmoran's skull was long after dug up in the Greyfriars' Churchyard, and recognised by the small hole through which the fatal bullet had entered. His house still exists in the Lawnmarket, a stately mansion, saying not a little for the affluence and comfort of the first class of merchants in Edinburgh in the reign of King James VI.

Towards the close of the sixteenth century, the remunerations of the masters appear to have been on a moderate scale. The head master, Hercules Rollock, a man of distinguished learning, and famous for his many compositions in Latin poetry, is found complaining of the insufficiency of his salary of £50 Scots (being £4, 3s. 4d. sterling), in as far as the fees were ill-paid by the boys; wherefore the magistrates agreed to his stipend being doubled. In 1598, these gentlemen fixed a scale of fees and salaries for all the masters, which will be understood by the modern reader, if he divides by twelve for sterling money: 'George Hastie, the first regent, was to have quarterly from each scholar 13s. 4d.; Patrick Peacock, the second regent, was to have the same sum; John Balfour, the third regent, had 15s.; and Alexander Hume, the fourth or principal, 20s. Besides this, the Principal was to be acknowledged by every boy at the school, "of ane quarterlie dewtie of xld." The teachers received salaries from the town: the first and second regents had twenty pounds, the third had forty marks, and the head master had two hundred marks yearly.'

There was, however, an irregular source of income, which has continued to be a feature of Scottish schools almost down to the present day. 'On the 20th of January 1660, the Town-Council appointed "intimation to be made to the doctors of the Grammar-School that the casualty called the *bleis silver* be delayed till the first day of March next." This was a gratuity presented to teachers by their scholars at Candlemas, when the pupil that gave most was pronounced *king*. The de-

signation appears to have originated from the Scottish word *bleis*, signifying anything that makes a *blaze*; it being conjectured, with great probability, that the money was "first contributed for this purpose at *Candlemas*, a season when fires and lights were anciently kindled." [To make good this conjecture, we recollect that at our first school, in a primitive part of the country, the boys always employed a part of the holiday in making what they called a *Candlemas bleeze*, generally setting on fire some field of dry gorse or *whins* in the neighbourhood of the town.] 'In addition to the customary quarterly fees, the masters deemed themselves entitled to a gift in the beginning of February, and this was named a "*Candlemas offering*." The practice existed in most of the public schools till a comparatively recent period. *Candlemas* was a holiday; but the children, in their best attire, and usually accompanied by their parents, repaired to the school, and after a short while was spent in the delivery of appropriate orations, the proper business of the forenoon commenced. The roll of the school was solemnly called over, and each boy, as his name was announced, went forward and presented an offering, first to the rector, and next to his own master. When the gratuity was less than the usual quarterly fee no notice was taken of it, but when it amounted to that sum, the rector exclaimed, *Vivat*; to twice the ordinary fee, *Floreat bis*; for a higher sum, *Floreat ter*; for a guinea and upwards, *Gloriat*! Each announcement was the precursor of an amount of cheering commensurate with the value of the "*offering*." When the business was over, the rector rose, and in an audible voice declared the *victor*, by mentioning the name of the highest donor. This, it must be confessed, was a very disingenuous practice, for the most meritorious scholars might be the least able so to distinguish themselves. There was usually an eager competition for the honour of *king*. It has been averred in regard to a provincial school, on an occasion similar to that to which reference has been made, that a boy put down a guinea to insure the enviable distinction of being *king* for the day, when the father of a rival scholar gave his son a guinea to add to the first "*offering*;" whereupon an alternate advance of a guinea each took place, till one had actually laid down twenty-four, and the other twenty-five guineas! Again and again did the Town-Council of Edinburgh issue injunctions to the teachers, to prevent "all craving and re-saving of any *bleis sylver* or *bent sylver* of thair bairnis and scholares, exceptand four penneis at ane tyme allanerlie." In days of old, when many of our houses boasted no better floors than the bare earth, it was customary to lay down rushes or bent to keep the feet warm and dry, as well as to give a more comfortable appearance. At the close of the sixteenth century and commencement of the seventeenth, during the summer season the pupils had leave to go and cut bent for the school. As in these excursions the young bent collectors "oftentimes fell a-wrestling with hooks in their hands, and sometimes wronged themselves, other times their neighbours," it was resolved that the boys should have their accustomed "*liberty*" or holiday, and likewise that every scholar should present the customary gratuity to the master on the first Monday of May, and on the "first Mondays of June and July, which is commonly called the bent-silver play, with which money the master is to buy bent, or other things needful for the school." Happily all such exactions are now unknown; and at four regular periods in the course of each session the teachers receive from their pupils a fixed fee, which is regarded as a fair remuneration for their professional labour.'

Early in the last century, a person of considerable literary celebrity became connected with the High School of Edinburgh in a humble capacity. 'David Malloch, who about this time filled the situation of janitor in this seminary, distinguished himself in after-life. Dr Johnson, in his "*Lives of the Poets*," says that Malloch or Mallet, from the penury of his parents, was

glad to accept such a humble appointment. We were inclined to question the accuracy of the statement, as his biographer mentions that the memoir was drawn up chiefly from hearsay testimony. Observing, however, that the election of a janitor was not at that period recorded in the minutes of the corporation, it occurred to us that the vouchers in the city chamberlain's custody might probably throw some light on the point. The disputed question was speedily put at rest by the production of Malloch's holograph receipt, dated February 2, 1718, for sixteen shillings and eightpence sterling, being his full salary for the preceding half-year. That was the exact period he held the office. The janitorship, it should be borne in mind, was not esteemed a post unsuitable to the age, or beneath the dignity, of a junior academic. In the university the same situation was repeatedly filled by students. . . . Malloch was afterwards tutor to the sons of the Duke of Montrose, with whom he made the tour of Europe. He subsequently settled in London, where he altered his name to Mallet. In reference to this change it was tauntingly said of him that he was called *Malloch* by his relations, *Mallet* by his friends, and *Moloch* by his enemies. His first publication was the beautiful ballad of "William and Margaret," which was followed by several other works, which secured for him considerable celebrity. With Pope, and Thomson, and a host of literary characters, he was on intimate terms.

A pleasant personal anecdote is recorded of a Mr Matheson, who was obliged to retire from the head-mastership in 1768, on account of bad health, but who afterwards recovered by taking abundant exercise in the open air. Under a mask of oddity, his conduct exhibited the clearest wisdom; and we, whose life is one exclusively of mental activity, can candidly say that we have often felt the *wish* to do as he did. 'In his summer peregrinations, he has frequently been known to spend several hours with any ditcher whom he found busy at his humble calling; and at his departure, gave the rustic some gratuity for the loan of his pickaxe. The temptation was too great, he also confessed, to pass a barn where the thrasher was at work, without entreating that he might be indulged for a little with the use of his flail. In winter, when he could not go much abroad, he was in the habit of repairing to the shop of Mr Aucheneck, a well-known cutler, where he would amuse himself in driving the large wheel. One day, when thus employed, a medical student from the sister isle happened to call, and, in the course of conversation, talked boastfully of the attainments of his countrymen in classical lore. Aucheneck patiently listened till a supposed stigma was attempted to be thrown upon Scotland. Fring at this, and wishing to confound as well as convince his loquacious customer that his averments were most erroneous, he adroitly observed that even some of his own workmen were by no means deficient. Having said this, he singled out Mr Matheson, who, in a quiet corner, at his voluntary task, had been all the while doomed to have his ear grated by this voluble pseudo-scholar, who held *quantity* at defiance. Matheson came forth, and to the utter confusion of the stranger, convinced him that learning was not exclusively the product of his native soil; and from the spirited lecture of the *ci-devant* rector, the Irishman was soon made fully aware that his censure was premature and unmerited.'

Our amiable author touches lightly on the severities formerly practised in grammar-schools, and in this among the rest. It might have been curious, as a contrast to the present more rational and humane methods, to have given a few traits of the severities of Nicol, which, we have been assured, were not much short of the atrocities of the Inquisition. Strange to say, in private life, this teacher was warm-hearted and genial. He seems to have entirely gained the affections of Robert Burns, who wrote, on the occasion of Nicol's house-heating, his popular song, 'Willie brewed a peck o' maut.' Even Dr Adam maintained no small rigour.

We have heard that at one of the examinations of the school, late in the life of this eminent man, he was honoured by the presence of several distinguished persons, his former pupils, including the president of one of the supreme courts of the country. It was getting dark, but, in the ardour of his examinations, the venerable rector heeded not the circumstance. Some one at length whispered to the judge, 'Would it not be well to give Dr Adam a hint that it was time to conclude and dismiss?' 'I!' cried his lordship with a shrug which involved a thousand recollections; 'what, I presume to interfere with the master! Oh no, indeed.' The last words of Adam on his deathbed are striking and affecting—'It grows dark, boys—you may go.'

SUMMER AT NICE.

Among the fair spots my memory loves to revisit—and they are not a few—Nice is the dearest. Almost every one seems to know Nice, and to know it is to love it. It is never mentioned without some affectionate adjective, nor, as I fancy, without a brightening of the speaker's eye, as if in sympathetic remembrance of that ever-smiling sky, and of the Mediterranean flashing joyously beneath.

Nice has no ruins, churches, or galleries of art to invite the tourist: it has only its sheltered situation, simple beauty, and delicious climate; but with these it needs no other riches. I would remark, however, that its climate is decidedly unsuited for those whose lungs are actually diseased. The clear air and sharp sea-breezes prove very irritating to consumptive invalids. But where the patient suffers merely from general debility, stomach complaints, bronchial delicacy, or great susceptibility of cold in the humid climate of England, Nice is the place to invigorate him, and make him literally a new being. I never was aware of the buoyant pleasure of life until I lived in Nice—I mean the mere animal enjoyment of *existence*—and now I look back upon those bright winters as the halcyon days of a calm beauty never to be forgotten. Think of never venturing out in November, December, or January without a parasol to shade one from the glare of sunshine, and sitting for hours, almost in summer clothing, on the ruins of the old castle which surmounts the hill behind the harbour, with the Mediterranean spread out at your feet as far as the eye can reach, so calm, so deeply blue—still deeper in colour than the sky that looks down lovingly upon it, as if protecting and watching the fishing-boats, whose white sails are like sea-birds in the distance! It is impossible not to feel better in mind and body when living amid beauty, and impossible not to feel, with Wordsworth—

'A presence that disturbs me with the joy
Of elevated thoughts; a sense sublime
Of something far more deeply interfused;
Whose dwelling is the light of setting suns,
And the round ocean, and the living air,
And the blue sky.'

But this is the Nice that everybody knows—the Nice of the tourist, the painter, the poet, and the English absentee. It is *my* hint to speak of it in summer, when it is usually considered by such visitors to be no more inhabitable than if it were seated in the very heart of the Great Sahara. Towards the end of April, or of May at the farthest, the place is deserted; the season is over, and the town is left to summer heat and solitude. The mountains which shelter it from the northern blasts, and consequently make it so desirable a residence in winter, now render it an oven; and in fact it would be utterly insupportable were it not for the sea-breeze. As a general rule, the English and all other foreigners take to flight at the approach of this season; but some few families, influenced by various motives, stand their ground. One summer we were among that number, for we wished to spend a second winter there; and the distance to any very cool summer quarters was great enough

to decide us to brave the heat where we were. However, we would not venture on this again, for the temperature was really more than sufficient to undo all the good the previous winter had effected. Northern constitutions are certainly not the better for four months' frying, with a shake of mosquitoes, and an extra hiss now and then, occasioned by the sirocco bellows. Now, however, that the physical inconvenience is over, memory spreads before my delighted eye nothing to mar the fairest possible picture of an Italian summer in all its indolent luxury. The fire-flies dancing through the nights of June, the shining lizards, and the mosquitoes themselves, seemed to be the only living things unresigned to spend their time in the 'dolce far niente,' the delights of which state are so totally unappreciable by those who have never felt warmer summers than our own. There was a novelty in our first southern summer which was not without its charms, in spite of the drawbacks. Rising at four or five, bathing in the transparent water, if the sun was not already too hot, taking a short walk in shady green lanes, eating fresh cherries as we went along (and peculiarly sweet they seemed at that early hour), coming home before six to an early breakfast, then dreaming through the day, dining chiefly on fruit, passing an hour or two in a siesta, breathing a little more freely as the evening drew on, reviving sufficiently to dress and go out about nine o'clock, strolling on the sea-shore, dreaming again while gazing at the calm, silvery moon riding peacefully in that summer sky, and nevertheless flinging down a shower of almost golden light into the rippling waves beneath; then home again, and, looking out of the open window, feeling more awake than we had done since the morning—for the sea-breeze was now cool (almost sharp sometimes)—and the moon and its showers of light in the water more beautiful than ever. This, continued day after day, may seem a monotonous routine; but it is not so; and I defy the veriest despiser of day-dreaming to pass a summer in Italy and escape the infection of the climate.

But we are sometimes roused by a storm. Indeed a thunder-storm is by no means unfrequent during the summer months at Nice. In July we had three or four, and one I remember very vividly. It began at eight o'clock one evening, after a day or two of intolerable oppressiveness. We heard the first peal of thunder with delight: it approached nearer and nearer, and the lightning flashed, as it seemed, without a moment's intermission; then the rain began to fall. It first rebounded off the hard-baked ground, which soon, however, yielded, and drank in with eagerness the refreshing shower. It ceased: the thunder roared more savagely, the house shook to its foundations, the lightning filled the room, as, in spite of the jalousies, it came in at the four large windows, and was reflected in the mirrors on the walls. There we sat for hours, some admiring, some terrified, all silent and awe-stricken. The lightning at length ceased to come in ordinary flashes; it appeared at the windows a broad thin sheet of light. The effect was most beautiful, as it illumined every object in the room for a few seconds at a time. Some of our party would not go to bed on account of the iron rods which supported the mosquito curtains; so we all sat up for company's sake. Suddenly we were alarmed by a rushing noise without: it was not the thunder, but was distinctly heard *with* the thunder. We rushed to the windows, threw back the jalousies, and saw the wonderful finale of the storm. Beneath our windows was the dry bed of a torrent, supplied abundantly in winter by the mountain streams, but long dry, and used, on account of its smooth clean stones, as a bleach-green by a number of neighbouring laundresses. Now, however, there rushed along its bed an impetuous river, carrying along with it logs of wood, quantities of hay, straw, charcoal, &c. which it had pillaged as it swept along the cottages of the mountaineers. The lightning was flashing on it the while, now and then seeming to convert it into a river of blood. It was a fearful, yet a grand sight. I

was rivetted to the spot, and did not leave it until at length the storm, which had now lasted five hours, gradually subsided; the clouds rolled away, and the moon, in all her gentle beauty, shone down upon the rushing torrent, and by her peaceful smiles wooed the discordant elements into harmony.

So much for the *physique* of Nice in the summer; but the *morale* is hardly so picturesque. I felt an interest, however, in one of the peasant girls, called Madeleine Bonnet. It is no harm to tell her name; for she could not read, even if she should see it written here. Her father was a working silversmith in Genoa, and when he died, his widow and children removed to Nice, where they had relations. They tried to support themselves by a little farm; but this did not succeed. The boys were too young, and the two girls, who were the eldest of the family, resolved to go into service. Marie, the eldest, soon found a situation in a Nizzard family; but Madeleine was ambitious, and determined to go only into an English ménage. She offered herself to us, and we found her appearance very prepossessing. She wore the becoming costume of the Nice peasantry—the graceful cappelino, and the black velvet ribbon round her glossy dark-brown hair. Her complexion was the clear olive of Italy, and her eyes had the lustre of that passionate climate, but beautified in their expression by the long black lashes, which hung over them with a mournful air I cannot describe. As she was well recommended by the hotel-keeper, we resolved to try her. She did not profess much knowledge; but her great willingness to learn soon made her a favourite, even with the cross old cook, and with our own English servants. This peaceful state of things in the kitchen did not last long, however. The old cook soon brought grievous charges against Madeleine, who, she said, stole the charcoal, and ought to be dismissed instantly. We could not readily acquiesce in this; especially as we found, on farther inquiry, that on no other head but that of charcoal was her honesty impeached. We could have imagined a girl of eighteen being tempted by cakes, or articles of dress; but what could she do with charcoal? It seemed nonsense. However, week after week the cook persisted in her allegations, and the matter must be investigated. Madeleine was called, and the charge made. She blushed scarlet, and did not attempt to deny its truth. 'It is a pity, Madeleine,' I said, 'that you have acted so, for we must lose confidence in you henceforth.'

This seemed to give her courage, and she answered, 'Ah, signorina, you think I would steal anything now! You are mistaken: I would rather starve than steal for myself; but, signorina, I have a mother, and she is very poor, and my little brothers are too young to work for her. She finds that she can make a very good trade by selling roasted chestnuts in the street; but it requires a great deal of charcoal to roast them all day long, and she grudged to buy it when she wanted food for the children, and I have sometimes given her a little.'

Though I felt that the poor girl's temptation had been strong, I thought it right to say, 'Yet, Madeleine, it was *stealing* when you gave away what was not yours to give.'

Her eyes flashed indignantly: her ideas of morality were evidently different: her heart swelled, and with tears she answered me—'Ah, signorina, you who have a mother whom you dearly love, to speak so to me! You are rich, and I am very poor; but if you and your mother were as poor as I and mine, you would help her in any way you could, especially if you had plenty to eat, as I have with you: and if you knew that she had a scanty meal at home, you *would*, signorina'—she added with energy, seeing me about to reply—'you would have done what I did.' She paused, and begged pardon for her vehemence, but not for the theft, which it was clear gave her conscience no uncomfortable qualms. I never felt more puzzled for a reply. I wished to show Madeleine that she had acted wrong;

nevertheless the conference ended here; and ended, strange to say, by interesting us all more deeply than ever in the impenitent culprit.

Towards the end of June, Madeleine came to me one day in great sorrow, saying that she must leave us, for that it was now the season to work at the factory—winding the silk from off the pods of the silkworms—that she would much rather stay with us, as the work is very bad for the health; not that it is laborious, but because the room in which the women sit is heated to a most distressing degree by the caldrons of boiling water in which the worms are immersed, and out of which they are taken, one by one, by the winders. The wages are very high to the good winders, and they are, in consequence, willing to endure the boiling temperature. We offered Madeleine equal wages, as we did not wish to lose her; but the master of the factory said that if she refused to work that summer, he would not employ her in future—for she was one of his best winders, and he could not afford to do without her—so she went. One day we went to see the factory: the winding of the silk was very curious: those accustomed to the work have acquired such delicacy of touch, that as they wind, they separate, with unerring precision, the silk of one worm into eighteen or twenty different degrees of fineness, and that without ever using the eye.

The work in which Madeleine was engaged soon made a very marked alteration in her appearance. From a robust, rosy-faced girl, she became in a little time thin and pale. The heat of a Nice summer would suffice to fade the roses on her cheek; but when, added to that, she had to live all day in a room steaming with caldrons of boiling water—kept boiling by fires below—it was no wonder that she looked three or four years older in the course of as many months. We often met her when taking our evening stroll along the shore. When the autumn approached, I asked her one evening when she meant to come back to us. She looked very much puzzled, and at last it came out that she hoped it would be unnecessary for her to go into service again. She was, in short, going to be married. But how was this? I must hear the story. It appeared that she had a Cousin Antonio, whose parents lived in Genoa, and to whom she had been in a manner betrothed almost from childhood. He was a baker; and when Madeleine and her family left Genoa for Nice, he had left it for Antibes, where he had a promise of employment as foreman to some wealthy baker. He was most anxious that Madeleine should marry him then, and accompany him to Antibes; but she 'was not ready,' she said.

'Why not ready, Madeleine?'

'Well, signorina, I must tell you the truth. We were very poor just then, after burying my father; and my mother could have given me no clothes worth mentioning, and so I could not think of marrying; for it is our custom here, when a young man marries, that his mother shall examine beforehand all the linen and clothes of his intended wife; and I could not submit to be mocked and called a poor wretch by Antonio's mother and sisters, who are much better off than I am, and who, to tell the truth, would be glad to have something to bring against me to Antonio.'

'But, Madeleine, your poverty would be nothing against you with your lover. I suppose you told him why you wished to wait?'

'Oh no, signorina! If I had, he is so generous he would have bought me everything I asked; but I wished to earn my clothes, and not to be scoffed at by my mother and sisters-in-law.'

'I admire your spirit. But was Antonio satisfied to wait?'

'Oh, he ought to have been satisfied; but he was angry with me certainly, and made me cry a great deal. But he was good again before I saw him for the last time.'

'And have you never heard from him since he has been in Antibes?'

'Only once, for I cannot read; but of course, if he

was ill, I should have heard from somebody. Ill news always travels. But I shall soon see him, and never part again,' she said earnestly. 'It was a long, long separation—almost two years. I did not know what I was undertaking when I refused to go at once with him to Antibes; but now it is nearly over, and we shall be happy all our lives together.'

I could scarcely share in the young girl's simple faith, and could not help saying, 'He may be well, Madeleine, but it seems very negligent to have left you a year without some message. Can he be growing careless or forgetful?'

'Forgetful!' she repeated after me with an arch smile and shake of her head, no doubt pitying me for my ignorance and scepticism as to her lover's character, but noway affected further by my doubts; and then she added, 'You know not, lady, how long Antonio and Madeleine have loved. There never was a time in their memory when aught was dearer to them than each other.'

I could scarcely share her trustfulness; yet I thought she might have good reasons for it, and I sincerely hoped so, and would not add a word to diminish her joy. But as she went away, I said, 'Well, Madeleine, we shall be here again for the winter; and if you be in Nice, and disengaged, you can have your old place if you choose.' Shortly after this we left Nice for a few weeks, making various excursions along the coast. On our return, my first care was to inquire after Madeleine. Her old mother came in answer to the message I had sent for her daughter. The poor old woman seemed quite overwhelmed at the conclusion of her daughter's lifelong betrothment. I cannot say that I was surprised, though I was indeed grieved, at what she told me. She had accompanied Madeleine to Antibes shortly after we left Nice. They had found Antonio alive and well, and prosperous—but married to the only daughter of the wealthy baker whose foreman he had been, but who was now dead, and to whose business and riches his son-in-law succeeded.

Madeleine was completely stunned by this intelligence; it was not, *could not be*, she thought; nor would she believe it until the faithless Antonio's own lips had left her no room for further incredulity. Broken-hearted, she returned with her mother to Nice; and sick of the world, at the age of nineteen she lost no time in gaining admission to a convent, and I saw her no more.

TURNING THE PENNY.

It is a common thing to hear wonder expressed at the great increase of street beggars. Is this really wonderful? A few extra pence will flood with candidates for work the meanest and dirtiest trades in the country, and why should we be surprised to find the same effect produced upon beggary by our virtuous generosity? We are said in statistics to give away, in the copper and small silver line, not much less than £1,500,000 per annum; and if to this is added the summing-up of the begging-books, in whole and half-sovereigns, crowns and half-crowns, we shall have a most tempting total of revenue for destitution. Even the refuge offered by the workhouse and nightly shelters is found to aggravate the social disorder. A nomade population has been fostered in the bosom of a settled community. To the 'workus,' as a permanent retreat, beggars have the most determined objection. Nor is this surprising. There is a charm in rags, dirt, halfpence, and gin, associated with freedom, which greatly transcends all the elegancies of the Union. Let us run over a few of the more recent cases, and inquire what it is our pensioners do in return for our bounty, and how they employ themselves abroad, instead of stagnating in the workhouse.

Could any one show a more marked disregard of all propriety of conduct than Ann Brady, who, though arrived at the mature ungirlish age of thirty-six, made

her unwilling appearance at the late Middlesex Sessions? Ann was accused of having turned the penny as a street beggar on every available occasion these fourteen years back. Not much good was said of Ann. Her accusers describe her as 'one of the most incorrigible begging vagrants who had ever been heard of. For years she had led a begging, drunken, and vagabond life; and the court would be astonished to hear that, at the instance of the Mendicity Society alone, she had been committed for various terms of imprisonment as many as forty-nine times! A kind-hearted magistrate, thinking to get her to abandon begging, had supplied her with money to set up a fruit-stall; but the whole of that money she had spent on drink. Whenever let loose from prison, she began begging in the old way; and with the first money she procured, she got regularly drunk in the nearest public-house. When last taken up, she kicked and knocked about terribly, and could not be brought to the station-house till she was tied on a stretcher. It was of no use doing anything for this woman, your worship. When good people got her a comfortable situation, she stole out of the house to beg; her favourite place of resort being the Park. And then she soon got herself into trouble. Since 1834, she had spent, put it all together, five years in prison.' In vindication of her rights, Ann said, 'It was a very hard case that the police would not leave her alone—it was enough to kill her.' Verdict of the court, 'six months.' Will the honourable bench of magistrates kindly explain what is to be the use of this fresh incarceration, beyond giving Ann a keener relish for begging and dram-drinking?

Much about the same time, up is brought to the police-office, Guildhall, 'a well-known impostor, Michael Leary,' charged with being a confirmed beggar, who carried on business by simulating a most dreadful pain in his back. Michael, it was alleged, lived on that back of his. 'The prisoner,' so sayeth the reporter, 'who was allowed to be in the anteroom, instead of being locked up in the cells, continued groaning all the time, declaring that he was dying from rheumatic pains; and when helped into the court, he redoubled his cries, "Oh my back, my back!" and clung to the railings of the dock, in which position he continued moaning at times, and to all appearance suffering great pain, while the evidence was taken down.' No. 267 of the city police gives evidence—'That about eight o'clock the previous evening he was on duty in Holborn, when he observed the prisoner walk from house to house begging, always appearing to complain of his back; after which he went into several public-houses, and obtained a quarter of gin, which he drank, and at last became rather intoxicated. Next he went into a coffee-shop, but did not get anything; and on his coming out, he took him into custody.' Michael denies being drunk, pleads ill health, and only begs because he cannot work. The magistrate tells him that went do: 'You are too well known to make me believe you were ill at all; and it's all sham now.' 'Hope you will send me to the hospital, sir, where I may get some relief to my aching back.' 'I shall send you somewhere else before you go there, and that is to prison for fourteen days, on bread and water.' The prisoner, unpitied, was then carried out by No. 267; loudly protesting, however, that he was suffering severely from rheumatism, and that he should certainly die under that terrible pain in his back!

Some people will laugh at this, and tell you that Michael Leary was doubtless an impostor, all his protestations about his back notwithstanding. But who demoralised Michael? That is the question. Wasn't it good folks who believed all the rigmale story of the back, and gave him halfpence out of pure soul-struck compassion? To be sure it was; and it is these good folks, with their credulity and their charity, that make beggars abound. Take another example. The other day, 'Thomas Henchcliffe, a thick-set, powerful young fellow, was placed at the bar of the Worship Street police-office, charged with being a begging im-

postor. A constable of the A division said he was on duty that morning in the City Road, when he saw the prisoner knock at a great number of doors in succession, and clamorously solicit charity, upon the ground of his being in great distress, and that he had sustained some very serious injury in his arm, which was suspended in a sling, and appeared to be crippled. Witness was dressed in plain clothes, for the more ready detection of offenders; and the prisoner, after leaving the last door he had applied at, at once made up to him, and in a canting whine commenced a harrowing detail of his real or assumed misfortunes, which would have no doubt been successful in the extraction of money from any casual passenger, but which instantly stopped upon the witness seizing him by the collar, and, pointing out his mistake, telling him he should take him to the station. He then asked him what he had been doing at the houses he had knocked at? and the prisoner, without the slightest prevarication, answered, "Begging." "And what is the matter with your arm?" said the witness. "Oh, nothing at all!" said the prisoner. "Then what do you put it into a sling for?" "Why, you see," said he, "when I went about with my arm not suspended and wrapped up in this way, I found that I could get nothing out of anybody, as the people I asked for assistance immediately exclaimed, "Oh, you are a strong young man, and ought to get a living by work;" and then went off without dropping a penny; so I put my arm into a sling as it is now, because I found that those who did so got more money!"—Sentence, a month's imprisonment, with hard labour in the House of Correction.

But the professed beggar resorts to many other shams besides malingering. He is a shipwrecked mariner, a workman out of work, a burned-out tradesman, an unfortunate actor on his way home to his friends, a distressed foreigner, and, generally speaking, he has a wife and family. In London, there appear to be places where beggars can be accommodated with 'properties' of all sorts, dying infants included. 'At a recent meeting of the Wesleyan Missionary Society, the Rev. Mr Branch said that a short time since he visited a room in Westminster where he saw a woman with a dying child in her arms. Commiserating the wretched creature's condition, he inquired into her history, and her means of livelihood, and in answer to his questions, she replied, "Oh, sir, my sufferings are great, and so are those of my child; but when my child is gone, I know not what to do." "But," observed Mr Branch, "it will be a happy release for you and your child, as you can make no exertions while you are burthened with her." "Oh, dear sir," ejaculated the mother, "when she is gone, I'll have to pay 9d. a day for another child, while she costs me nothing. Unless I do so, I'll earn nothing by begging, for it is the children that excite compassion!" In another room in the house Mr Branch found forty beggars, vagabonds and rogues, male and female, young, old, lame, and blind, gathered round a fire, all relating their exploits, and planning for their next attacks upon the public. In a regular ware room in Westminster he saw exhibited for hire and sale every variety of dresses, including widows' weeds and tattered rags, shabby-genteel costumes, clerical suits, &c. adapted to the different plans of mendicant operations pursued by the several parties who patronised this extraordinary bazaar, and who made begging a profession.'

Going about with certificates of character is a very effective method of operating on the compassionate. On a former occasion we referred to a case related to us by a party concerned, and it will still bear a few more particulars. Some five or six years ago, a man who carried on a small trade as a tinsmith in a country town in England, was one night burnt out of house and home. A great misfortune for the poor man! Not at all. It was the best thing he ever experienced that burning. He became a fit object for the philanthropists; and all very proper, if they had acted with considerate caution. In his destitution,

the homeless tinsmith was sought out by a gentleman whom we shall call Mr Meanwell, and furnished with a subscription-paper, headed by a true and particular account of the fire and its consequences—wife and family houseless, stock in trade gone, contributions would be thankfully received, &c. Armed with this commission of botheration, off went the ruined tinsmith on his travels, destined never more to take hammer in hand. First, he made a round of the town. In one day he pocketed eight pounds seventeen shillings and sixpence of the remarkably good coin of these realms. With this neat sum jingling in his pocket, his hand dipping down among sovereigns and shillings—pleasant feeling!—a new light dawned on the forlorn tinsmith. He had a realisation of the vast powers of a subscription-paper. It beat tin-beating all to nothing. Formerly, he had toiled weeks and weeks, and not made as much as he had now done in one day. Work was all nonsense. Next day, at the begging again. Three pounds eleven, all equally good money, rewarded his persevering industry, independently of expressions of commiseration which did not count. The impetus towards mendicancy was now altogether irresistible. To go back to the tin trade would be clearly a running in the face of destiny. Missus being of a similar way of thinking, it was soon arranged to carry on the new and lucrative profession. Having exhausted all possibilities of cash within the immediate sphere of the conflagration, the burnt-out tinsmith and his wife, a 'decent-looking woman in a black bonnet,' went away on an excursion through the provinces. And from that excursion they have never returned, and never will. Occasionally they are heard of on their peregrinations, picking up a sovereign here and a half-crown there, all through the virtue of that wonderful subscription-paper. 'It is the worst thing I ever did in my life,' said Mr Meanwell to us, 'giving that unlucky certificate of character, with my own name down for a guinea at the top of it. It is a warning to me how I do anything of the sort again.'

When once a man has experienced the benefits of begging—the very great ease of the thing, its superiority in point of money—returns to downright hard work—you could not convince that man that labour was more honourable and more profitable. All your philosophy about the dignity of independent labour would be thrown away on him. The Liverpool papers give us a very pretty case of a genteel incurable in the begging line. 'Thomas Holland was yesterday committed to prison for one month, on a charge of street begging. It seems he has pursued his avocation to a considerable and very profitable extent, as the circumstances we are about to relate will prove. We learn that his committal was the consequence of his having importuned, amongst others, the stipendiary magistrate himself. For some time the delinquent has been in respectable lodgings kept by a widow, who has also several other lodgers, clerks in the customhouse and mercantile establishments in the town. From the time he went to these lodgings there has always been some mystery as to his means or pursuits; and all that seems to have been known of him by his landlady was, that he represented himself as a respectable decayed tradesman come to reside in Liverpool. He was always a complete epicure in his diet, and unsparing in procuring for himself all the choice edibles which the most fastidious taste could desire. To breakfast he uniformly had his broiled chop or steak, and was most particular as to the quality of his tea and coffee, always procuring the best of each, and having it prepared for him in the best possible manner. In this respect he was exceedingly hard to please. In his other meals he was equally hospitable to himself, and on all occasions his appetite was perfectly astonishing to the inmates of the house. As regards the other bodily comforts of life he was equally particular. During the time he remained in the house he would sit before a huge fire, which he always insisted should be kept up, his feet being comforted by extra carpets and rugs, and his legs wrapped up in blankets. Indeed, in all his

arrangements he seemed to be exceedingly well acquainted with the means of personal comfort, and did not fail to make the most of them. He seldom turned out of the house until eleven or twelve o'clock in the morning, except on Saturday, when he was always ready for his breakfast by eight o'clock, and uniformly anxious to go out soon, as if he had urgent business on that day. He was very fidgetty if his meals were not always ready at the moment he wanted them, and would on these occasions tell his landlady that she could always look after the young men's wants, but because he was "a poor old gentleman, he must be neglected." He had latterly become so tedious, that she gave him notice to quit; but he declined to receive it, observing, "What a wicked woman you are to ask me to leave; it is not convenient for me to leave, and I shall not leave!" He was always very prompt in the payment of his board, and until his committal, the landlady had not the remotest idea that he was obtaining his livelihood by begging. This was only found out by his unaccountable absence from home for a few days. At the time of his committal his larder was well stocked for the following week.' Of course, since his liberation, Mr Holland has resumed business, and the world will most likely hear of him by and by.

'Punch,' that philosopher by contraries, has recently parodied Burns's 'Jolly Beggars' with considerable success, at least in the spirit of one of the songs. Among the company, met at midnight for a characteristic jollification, there is the Serious Poor Young Man, in a threadbare black coat, white cravat, and excessively bad hat. This is the sentimental strain he contributes:—

'A lazy humbug I was born,
To earn my bread I held it scorn,
And found it far a better plan
To act the Serious Poor Young Man.

Sing hey the Serious Poor Young Man!
Sing ho the Serious Poor Young Man!
There's not a scamp in all our clan,
Can match the Serious Poor Young Man.

With cedar pencils in my hand,
Or sticks of sealing-wax, I stand,
"Soft Tommies'" hearts I thus trepan,
The decent Serious Poor Young Man.
Sing hey, &c.

I'm ne'er caught begging in the fact,
So don't infringe the Vagrant Act:
And let the law do what it can
Agin the Serious Poor Young Man!
Sing hey, &c.

A CURIOSITY IN LITERATURE.

AMONG recent instances of the dispersion of our sheets in quarters where it was not anticipated they would penetrate, one of a peculiarly gratifying nature has come to our knowledge, and we trust to be excused for drawing attention to it as a fact interesting in literature.

It may be generally known that during the last twelve months we have been engaged in preparing and issuing a new edition of the 'Information for the People,' a work of which seventy thousand copies had been previously disposed of, and which now, in its improved form, has attained a circulation of forty-five thousand copies. Some time ago, we had occasion to notice that the work had been reprinted, without our concurrence being asked, in the United States, and also formed the basis and model of a work, 'Instruction pour le Peuple,' issued in Paris. The circumstance now attracting our attention is the translation of the work into Welsh, and its issue in parts in a form very similar to that of the English original. For this commercial adventure of a Welsh bookseller, Robert Edwards of Pwllheli, Caernarvonshire, we had not been altogether unprepared; for to his application for casts of our wood-engravings to insert in his letter-press we had given

some attention—of course making no charge for these illustrations, and only too happy to aid so far in what appeared to be a meritorious and hazardous enterprise.

The first part of this remarkable translation is now before us; and on the front of the blue cover appears the following title:—‘CYFIEITHIAD O ADDYSG CHAMBERS I'R BOBL, CAN EBENEZER THOMAS, “Eben Fardd.” Cynnwysiad—Seryddiaeth, Daeardraith.’ The two latter words signify Astronomy and Geology, such being the contents of the part. At the foot of the title are the words ‘Pris Chwe’ Cheiniog,’ which means price sixpence—a charge double that of the original; but, we should infer, barely sufficient to repay the outlay on the undertaking. The translator, Ebenezer Thomas, or Eben the Bard, is a person of no mean celebrity in Wales. A correspondent, who calls him the ‘Shakespeare or Burns of the Principality,’ forwards the following notice of the bard and his present literary effort from the ‘Amserau,’ a popular Welsh newspaper:—

‘Eben the Bard has already immortalised his name as a poet. Here we meet with him in the character of translator, and his abilities as such are equal to those which distinguish him as a poet. It must be absolutely superfluous to attempt saying anything by way of recommendation to the work he has now translated. What necessity is there for writing a panegyric on the sun? And why should the value of knowledge require to be made a subject of laudation? The treasure of miscellaneous instruction contained in the work of Chambers is beyond all price [Thank you, Mr Critic!], and there are thousands in England, Scotland, and elsewhere who have been drawing from this store for several years past. The “Information for the People” is now brought within the Welshman’s reach in his native tongue, so that he likewise may participate in the same privilege and pleasure. The first part is highly interesting: it leads the reader to contemplate the wonderful works of God in the heavens and earth. It offers a vast amount of instruction, more valuable than much silver or gold! The language is chaste, elegant, and intelligible. The translator is in every respect worthy of the author. The paper and printing are good—an honour to the Pwllheli printing establishment. Surely such a work as this will meet with a hearty welcome and extensive circulation.’

Mr Edwards, in undertaking his costly speculation, seems to have found it necessary to bespeak the favourable consideration and assistance of a number of distinguished Welsh divines, who obligingly furnished him with their testimonies to the general utility of the work. These certificates of character, as they may be called, are printed in Welsh inside the cover, and may be supposed to carry with them a due degree of weight among the ancient Cymry. A few passages, translated, may be given, for the sake of showing that the clergy of the Principality are fully alive to the value of general secular knowledge within the range of their professional duties. The Rev. Isaac Jenkins, St David’s College, says—‘Such a work is greatly needed in the Welsh language; and as one who loves his country, and desires the improvement of its inhabitants in all useful knowledge, I can do no less than wish that every facility may be given for placing this excellent work before them. The undertaking is arduous and weighty; but I hope that sufficient sympathy and co-operation will be manifested so as to encourage the publisher. Failure in such an attempt would be a great dishonour to our nation, as well as give room for further reproach from our neighbours.’ The Rev. Arthur Jones, D. D., Bangor, observes—‘I am surprised and delighted that there is a prospect of the Welsh acquiring the elements of knowledge necessary to all men and women. The work in question will enrich our nation; and as it will gradually reach every neighbourhood, all, both old and young, even children, by practising economy, may possess the treasures it contains; and by it may cultivate their abilities in a very high degree.’ The following, from the Rev. Lewis Edwards, M. A., at Balla, is

still more pointed:—‘I am exceedingly glad to find that “Chambers’s Information for the People” is to be translated. Works such as this are what the Welsh require, not to the exclusion of religious, but in addition to all the theological works already in circulation amongst them.’*

The last sentiment in the above conveys what has all along been a prevailing principle in the production of these sheets: they are not intended to exclude religious culture from the general concerns of life, but to impart what is properly additional to religion. Whether the diffusion of the ‘Information’ in Welsh will be as serviceable as is indulgently supposed, we have no means of judging. That any necessity should have existed for the translation, is exceedingly to be lamented. Not even the gratification of seeing the work in this new character can lessen the pain of knowing that a large section of the people still use a language—ancient and copious, no doubt, but calculated, we fear, to retard their social progress. That until the middle of the nineteenth century, the Celtic tongue, in its varieties of Gaelic, Welsh, Irish, and Manx, should be employed as a vernacular, is matter not less of surprise than of national discredit. Who has been to blame for this scandal—the civil government, the church, or the people? Perhaps all three. No thought appears to have been bestowed on the fact, that large masses of the population were isolated from general progress on account of their inability to speak English. And for this neglect, with other circumstances of misusage, how conspicuously has the nation at large suffered! One thing, however, must be said for the Welsh, that under all the disadvantages of a local tongue, they have not languished as a people, nor become burdensome to their Anglo-Saxon neighbours. Failings they have, but a disposition to live by begging is not among the number. A plodding race they are, and, as respects a living literature, they go very far ahead of their Celtic brethren in Scotland or Ireland. The very circumstance of their attempting the enterprise which has suggested these remarks, is significant of an energy of character which we should in vain look for in the Highlands, where Celtic newspapers and periodicals have never met with that degree of encouragement necessary for their permanent establishment.

LIFE IN NEW ZEALAND.

THE newspapers give the following copy of a letter just received by Mr John Clark, yeoman of Timsbury, near Romsey, Hants. The writer—William Battin—was formerly shepherd in Mr Clark’s employ, and emigrated to New Zealand about six years since. The simple, unadorned narrative of New Zealand life, which the letter furnishes us with, will doubtless be interesting to our readers:—

NEW PLYMOUTH, NEW ZEALAND, April 30, 1843.

I think that I can now say that the settlement is likely to do well, as the government have purchased from the natives every mile of rich ground, and the settlers that have been so long deprived of their land are now allowed to choose land from the district. The whole of Taranakie is well supplied with springs and fine rivers of good water; plenty of fish and wild ducks. The greatest produce of the land hitherto has been wheat, of which we have very excellent sorts. The finest wheat that can be sold is L.8 per load; barley, 6s. per bushel; oats, 6s.; potatoes L.2 per ton. The settlement has been very low, and the settlers in general badly off; but even then the labouring-classes were much better off than the labouring-classes in England. But now, thank God, we have got the boot on the other leg, and every settler has plenty; in none but the miserable huts of drunkards can the inmates say they ever know a banyan day. It is just five years two months and ten days since I landed here, and have been

* In the original—‘Da iawn gennyf weled bod “Chambers’s Information for the People,” i gael ei gyfieithu; Llyfrau fel hyn sydd eisau ar y Cymry—nid i gau allan Grefydd, ond yn ychwanegu at yr holl Lyfrau duwinyddol sydd eisioes yn ein iaith.’

just three years and twenty days independent on my own free land; and if John and Thomas had come with me, they might have been just as well off, and for three years have been lords of splendid harvests. I have moved from Pokeokeps, and am now at Pegrikurik. I have a large two-storey house, with eight rooms, convenient for every purpose. I have the best garden in the place, containing two acres, and rise everything to an amazing size. I have the largest and most convenient barn in the settlement. I have this year about 400 bushels of wheat, a few of barley and maize. I raise yearly about 50 tons of potatoes, very large, and about 1000 tons of Swedes, and about 300 cabbages from 10 to 40 lbs. each, and a great quantity of fruit and flowers and other vegetables in abundance. I have also ten good hogs, and often twenty. Bacon, pork, poultry, eggs, butter, milk, fish, and such-like, very plentiful. I have firewood enough to last my house a century, and burn on the land thousands of loads to disencumber. Two bushels of seed wheat to the acre is the regular go; the fern land produces thirty bushels to the acre; and the bush land in general about fifty. Mine is all timber land, and my place will bear inspection by any person. In May is the best season to sow wheat, and might be continued till August, and harvest in January and February.

The winters here are very much like a cold wet summer in England. I have only three times seen ice as thick as common window-glass, no snow, and very little white frost. This is, I think, the finest climate in the whole world; neither myself nor one of my family have ever known a day's illness since we left England. I am now forty-eight years two months and a few days old. I appear twenty years younger to look on than when I left. My eldest son William is about to purchase for himself 200 acres of land, entirely by his own savings. Here is a chance for every one. The natives are beginning to raise wheat in abundance, and have several mills to grind corn in several parts of the country at their own expense; they have (the greatest part of them) embraced Christianity, and are becoming very civilised.

The missionary stations are about forty miles apart, and many of them quite in the desert, amongst the natives only, and have to travel and preach twenty miles each way; and it is surprising how the minds of the most savage tribe—those that have been making war—are now beginning to be very humble. Those about us are very civil and honest. They work just land enough to keep them: it is not one acre out of 1,000,000. There wants now, in this district of Taranakie, 100,000 emigrants. People starving in England, and millions of rich, willing land here useless—such easy-working land, that any man can throw out twenty sacks of potatoes in one day. The town of New Plymouth is situated by the sea-side, and is laid out in straight streets, two miles long, and one mile across, with a belt at the back, side, and ends, containing a large new hospital, many small farms, and much waste land. The town at present is but scattering—most of the houses built of timber. The church is built of stone, about three times the size of that at Timsbury. The Wesleyan chapel is built of stone; also a strong unoccupied prison built of stone. Here is no clay fit for brickmaking, but plenty of stone of all sorts and sizes. Along the beach, the river runs over amazing beds of pebbles for many miles. Fresh-water eels are often caught, ten, twelve, and twenty lbs. each. The settlers are scattered out wide. At the Omri there is a church built with timber, and a Primitive chapel. Sabbath schools are kept on, as in England. Wild fowls are plentiful, and it is every one's own fault if they do not sleep on beds of down. Half a mile in front of the sea the land is sandy, bearing saving crops; further in it is black mould—no stones. Oxen want no grass; horses want no shoes; one share point will last six months. Beneath the black mould it is brown earth—wants subsoling.

The timber and big bush is cut down in a rough way, lying six months, when the fire burns all up clean, except logs and stumps. The wheat is sown and scraped in, in a rough and light manner, and without grubbing. A crop of fifty bushels to the acre is pretty sure. It is not a very good country at present for sheep, although here is no fly or maggot, and sheep fatten fast, and some have good fleece. All cattle here are in good condition. Cattle here increase fast, as no calves are killed, and ship-loads arrive from New Holland. All that will may have cows, and at the cattle station there are about 300. Here is some horses, but the work is mostly done by oxen. The hours for labouring-men are from seven till five. The price for

thrashing is 8s. per quarter. There are four thrashing-machines here; but the slow pace of the oxen, and reckoning all hire, brings the price to 12s. the quarter. Corn thrashes better than in England. Men might earn very high wages, but very few can get their heads off their downy pillows till the sun is three hours in the sky. Thank God! I can rise most mornings to salute the opening dawn. Almost every one has land, and is half independent. There are no soldiers; but we have a police of about twenty men, drilled to the musket like soldiers. There are no natives more than about three miles inland, except when wandering about, which is common.

Here is no manner of wild beasts, no serpents or reptile; no manner of vermin but rats; no thorns or thistles. You might travel barefoot, lie down and sleep in any part of the wilderness, without the least danger. Amongst the thousands of birds, I have never seen one like one I saw in England, except hawks. The small green parrot, with red heads, are the only birds that hurt the corn. Amongst the many sorts of wood, I have never seen one sort like any I ever saw in England: it is astonishing the size and height of the timber. The hen bark is nearly as good and equal to oak for tanning. In many places is found red, white, yellow, brown, and black ochre, very soft and fine, and fit for making paint. The mines are not yet worked, and the Cornish miners have all left for other settlements, being useless here. In sinking a well, close to a town, was found some metal, and tried by Mr Woods, a goldsmith, and proved to be hard silver. No chalk or limestone is yet discovered in Taranakie. Money has for a long time been scarce, and most of the business is done by barter. Flour is sold by the dozen pounds, and it is 1s. 6d. per dozen for the best, and 1s. 4d. for seconds; it has been as high as 6s. per dozen. Many ship-loads of flour is sent to Auckland and Port Nicholson, where it fetches about double the price. The highest price for butter of good quality is 1s. per lb.; inferior 10d. Pork, best quality, at dear shops, 3d. per lb.; other shops, 2d. I and many others kill our own. All clothing is about double the price as in England, also iron work. Millers, shopkeepers, blacksmiths, and carpenters, are making their fortunes, and I have no room myself to complain. I hope every kind gentleman in England will try and get my nephew William Battin sent to New Plymouth, Berkshire, and ship for New Plymouth. The wheat is cut after the Cornish fashion, with large ewing hooks, and I my own-self can cut and bind a full acre in a day of stout wheat. He need not bring any reap hooks. Here are four breweries, and hops have sold at 10s. per lb. I have not spent one penny on any kind of spirits, or at a public-house, for more than four years, thank God. I and my children are safe and happy as larks. It is not certain whether the Topo mountain is burning now or not, but it is certain that a river of boiling water issues from it, wherein much cooking is done. There is no smell or bad taste from it. Topo is the native name of the mountain. The district of Taranakie is fifty miles across, and is the native name of the mountain from whence the district takes its name. There are wild pigs by legions, half fat. As the climate is good, and soil rich, very little art is required for farming. Holloway and his family is left, and gone to New South Wales, but writes to Gibbons to say he is coming back, for there is no place like Taranakie. Here in the summer the singing-flies charm the country. I have seen some of the cannibal ovens; they are pits about 6 feet square, and 2½ feet deep, and contain about three cart-loads of stones, which, when heated, cooked two or three large bodies at a time. All that is totally done away with now. Bees are increasing fast; I have six stocks at present, and intend keeping forty standing stocks. Bees gather the whole year, and can take the honey at any time; they gather about 5 lbs. of honey a month throughout the year: honey and wax is about the same quality as that of Hampshire; honey is selling at 2s. per lb., and wax at 5s. Two mills are said to be finished in a month, one having two water-wheels driving three pair of stones, the other with one, driving two pair. The price of sawing timber is reduced from 20s. to 10s. per 100 feet—300 feet a day's work for a pair of sawyers. Sawyers and shoemakers have been making money rapidly. Carpenters' wages have risen from 5s. to 6s. per day. At the commencement of the settlement, very few thought of anything but extravagant living, fine dressing, and the grog-shops; but when the Company's high prices were over, they were forced to alter, and get land for a living, and the money that had been thrown

away as with a shovel was then wanted. I worked out eight acres of land at earning 10s. a day. I have an entire free estate, sufficient for every comfort in life; and if John and Thomas could but once see what I have gained by coming to New Zealand, what chain could hold them in England?

It is said that emigration is going on, and I hope it is true, and hope that my nephew will pluck up courage and come; I should be pretty sure to meet him when he and his family lands; but if I should not, he must inquire for 'Goshen House' or 'Noah's Ark.'

The sands here are proved to be the best of iron, and Mr Price is about to erect a foundry. Ships are now taking loads of potatoes to Sydney, where the wholesale price is now L8 per ton. Earthquakes are not felt often; I have felt but two heavy shocks for two years. It appears there have been two great earthquakes, as the land in some places is broken in pieces: one appears to have been 2000 years ago; the other must have been in very ancient days.

I cannot learn by any of the most ancient natives that there was ever anything like dearth or famine in this isle. There have been eruptions at the big mountains, and millions of tons of stones and massy rocks are thrown out, either by fire or water.

The postage of letters from England is 8d.; if to Sydney or Adelaide first, it is 1ld.

Public-house licences till ten o'clock, L30; and twelve o'clock, L40 a year. Only two shops of that kind in this place. My eldest daughter has been married some months. The natives are all married by the missionaries, and the old-fashioned way of knocking their heads together is done away with.

There have been wars in different parts of the island, and some soldiers and settlers killed; but it is in peace now, and we have never had any wars, although we have once been threatened by the natives of the Topo tribe. The natives of this place prepared, as well as us, to attack them; all we could muster was eight pieces of cannon, some guns, and twenty muskets. The news soon reached Port Nicholson; the government brig happened to be there, which sailed immediately with a supply of arms and ammunition for us. A native went to spy, and in a month returned, saying a young man, a sort of prince, had shot himself playing with his gun: the whole tribe went to bury and bewail him; meantime a missionary found his way to them, telling them the white people meant them no harm, and if they did go, it was likely their heads would be taken off and sent to England to be made sport of. Not liking these thoughts, they thanked the missionary, and returned to Topo, leaving us in peace; however, a part of the same tribe have since made war with the settlers and soldiers at Zouganessie, but being beaten, are again returned to Topo.

Here there is no turnip-fly, but the grasshoppers are very destructive to all late-sown crops.

This settlement of New Plymouth has been for some time like an infant without a friend: it seemed like no man's land, belonging to neither government nor company; but since his excellency Governor Grey has visited, and seeing it a paradise, and a good corn and cattle district, although no harbour for shipping, he is very desirous to put and encourage it forward; and, with the good industry of the settlers, this will be the best settlement in the south. The summers are not so hot as in England; the weather has been very fine this last twelve months; the thunder here is little, and very mild and gentle.—From your well-wisher,

WILLIAM BATTIN.

'SIX DAYS SHALT THOU LABOUR.'

It seems generally to escape observation that the fourth commandment as effectually enjoins *work* during the six days of the week as it does *rest* on the seventh. This double meaning is alluded to as follows in the Cape Literary Magazine. 'It is asked somewhere in the Talmud—"The wealthy of many countries, whereby are they deserv- ing of becoming rich?" Samuel, the son of Yosi, replies, "Because they honour the Sabbath." Samuel, the son of Yosi, if I might presume to put another construction upon thy answer, I would say, "Because they keep the fourth commandment." Let not the idle vagabond, who rests on the Sabbath and on the six days also, upbraid the Lord and say, "I keep the Sabbath holy, and yet am poor." Poor thou art, poor thou wilt be, and poor thou deservest

to be; for though thou keep the Sabbath never so holy, unless thou work six days out of the seven, thou break- est the fourth commandment, and canst never attain to wealth, to health, and to happiness. This is the doctrine which I proclaim, and maintain, upon Scriptural authority; and if that suffices not, go to yonder bloated, gouty cox- comb, who, upon a bed of down, feels his foot in a lake of fire; the mere moving of his footstool is a volcano to him, and the ringing of the bell by his physician's footman is an earthquake. Had he kept the commandment, not only on the seventh, but on the six days, he might have thrown physic to the dogs, and left me to seek another illustration of my moral.'

BEN AND LOCH LOMOND.

STILL sleeps Loch Lomond by her mountain side,
And still within her bosom's placid deep,
The image of her lord her waters keep,
In all the freshness of a first love's pride.
Grief hath not seared them, time cannot divide,
Youth hath not fled; as beautiful are they,
As when the morning of creation's day
Saw them first joined, a bridegroom and a bride.
Nature, unchanged, still meets the gazer's eye;
The hills are still as dark, the skies as blue,
But vainly fancy wouldst thou now descry
The waving tartan's many-coloured hue;
Vainly wouldst listen for the pibroch's cry;
Man and his works: these things have passed by.

F. F.

TEMPERANCE IN WINE COUNTRIES.

My observations in France, as well as in Germany and Italy, satisfy me that the people in wine-growing countries are much more temperate than in the North of Europe and in America. The common wines which are used on the soil that produces them do not intoxicate, but nourish, forming a large item indeed in the *pabulum* of the peasant. When he goes out to his daily toil he carries with him a loaf of coarse black bread, and a canteen of wine, and these refresh and sustain him: he rarely tastes meat, butter, or cheese. This *vin ordinaire* makes a part of his breakfast, of his dinner, and of his evening meal; and costs him perhaps two or three cents a bottle, if he purchase it. It is the juice of the grape, not deriving its body or taste from an infusion of spirit and a skilful combination of drugs, as in our country, but from the genial soil and beneficent sun. The truth of what I have here said is supported by the general remark, that drunkenness is but seldom seen in France; and when it is, it does not proceed from the use of the common wine which enters so largely into the sustenance of the peasantry and common people, but from brandy and foreign wines; particularly the first, to the allurements of which the hard-worked and closely-confined mechanics, artisans, and dense factory populations of the capital and large towns are particularly exposed. I am obliged to believe that the use on the soil of any native wines in any country is conducive to health, cheer- fulness, and temperance; and I am as equally convinced that all foreign wines are injurious in all these respects. Hence the bad effects of the wines imported and used in England and America.—*Durbin's Observations on Europe.*

RE-VACCINATION.

1st, Every individual is susceptible of vaccination; 2d, Re-vaccination is not necessary before puberty; 3d, The system undergoes a change at puberty, and re-vaccination is then necessary; 4th, Vaccination is a sure preventive of small-pox; 5th, Re-vaccination is a sure preventive of varioloid; 6th, The third vaccination is inert; 7th, The system is susceptible of varioloid after puberty, whenever the individual is exposed to small-pox, without re-vaccination; 8th, Re-vaccination is not necessary if the first operation was performed since puberty; 9th, Those who disregard vaccination are always liable to small-pox, whenever ex- posed to the influence of that dreadful disease; 10th, If every individual were vaccinated before puberty, and re- vaccinated at that revolution of the system, there would be no such disease existing as small-pox.—*Substance of a paper in the Boston Medical and Surgical Journal.*

MUSIC OF THE WILD.

PROCESSIONS of the fairies long ago were always accompanied by the sounds of music:

'Their oaten pipes blew wondrous shrill,
The hemlock small blew clear;
And louder notes from hemlock large
And bog-reed struck the ear.'

—*Ballad of Tamlane, Border Minstrelsy.*

The bridles of the elfin steeds were also heard to ring, as the troops, seen or unseen, dashed past the alarmed mortal. It is just possible that there may have been a natural foundation for this feature of the fairy superstition, as has been proved to be the case with many other once-supposed supernatural things. There is at least a class of natural sounds, of a somewhat obscure character, which appear not unlikely to have been mistaken in a superstitious age for fairy music. We have been assured, though only on hearsay authority, that a few years ago the people of a small district in Roxburghshire were kept in a state of excitement for several days by sounds, as of music, wandering over the country, for which no one could account, though all heard it. In 1840, some moaning sounds in the Ochil Hills in Perthshire, attracted scientific attention, on the occasion of an earthquake taking place at Comrie, a few miles off. The sounds may have been occasioned by earthquakes in both cases. It has indeed been remarked as probable that the Ochil Hills anciently acquired their name from sounds connected with the Comrie earthquakes, which are of notable frequency, being heard amongst them; for the Gaelic word for moaning, howling, wailing, is *ochain* or *ochail*.*

There is a fine descriptive passage in one of James Hogg's poems—

'That undefined and mingled hum,
Voice of the desert, never dumb.'

Many must have observed this indescribable sound, as they rested quietly and listened in lonely situations. It seems the very shadow of absolute silence. The author of the 'Journal of a Naturalist' apparently alludes to it when he speaks of the 'purely rural, little noticed, and indeed local occurrence, called by the country people *humming in the air*,' as annually to be heard in the sultry forenoons of July in one or two fields near his dwelling. 'It is generally,' he says, 'in some spacious open spot that this murmuring first arrests our attention. As we move onward, the sound becomes fainter, and by degrees is no longer audible.' He thinks it must be owing to swarms of bees elevated to such a distance in the air as to be invisible. Another writer demurs to this explanation; 'for,' says he, 'it so hap-

pens that in the bosom of a thick wood, where there is a space partially opened, though still a very narrow and confined spot, in days precisely such as he describes them—that is, sultry, and in the middle of summer, when the air is calm—I have often paused to listen to a similar aerial humming, appearing to result from some unseen power close at hand, which for several years I hesitated not to attribute to insects; an opinion I felt compelled, though reluctantly, to give up, since, after the most diligent search, I could never detect the presence of any collected body sufficiently numerous to account for the effect.*

Humboldt, in his Personal Narrative, speaks of subterranean noises, like those of an organ, heard towards sunrise by those who sleep upon the granite rocks on the banks of the Orinoco. This will recall to the reader the celebrated statue of Memnon in Egypt, which at sunrise emitted musical sounds—a fact attested by so many respectable writers of antiquity, that there seems no good reason to doubt it. A frozen bay described by Mr Head (brother of Sir Francis) in his 'Forest Scenes' presented similar phenomena. After speaking of the loud noises produced by the cracking of the ice, he goes on to say—'A dreary undulating sound wandered from point to point, perplexing the mind to imagine whence it came, or whither it went, and whether aerial or subterranean; sometimes like low moaning, and then swelling into a deep-toned note, as produced by some Æolian instrument—it being in real fact, and without metaphor, the voice of winds imprisoned in the bosom of the deep.' He found this recur whenever the temperature fell very suddenly. It seems a phenomenon nearly allied to what the Welsh and Scotch call the *soughing* of the wind. The writer already quoted by his initials E. S. says—'On turning to a map of Cheshire, it will be seen that from within a short distance eastward of Macclesfield, a range of hills extends in an irregular curve to the north-west, forming a sort of concave screen, somewhat abruptly terminating over the comparatively level plains of this part of the county. In different parts of these, as well as in more elevated spots, at the various distances of from four to six miles or more, at certain seasons of the year, usually in the early part of spring, when the wind is easterly, and nearly calm on the flats, a hollow moaning sound is heard, familiarly termed the "*soughing of the wind*," and evidently proceeding from this elevated range, which, I should add, is intersected with numberless ravines or valleys; and I have no doubt that when the atmosphere is in that precise state best adapted for receiving and transmitting undulations of air, a breeze, not perceptible in the flat country, gently sweeps from the summits of the hills, and acts the part of a blower

* Proceedings of Geological Society, No. 91, 1842.

* 'E. S.' in Jameson's Journal, March 1830.

on the sinuosities and hollows, or cloughs, as they are called, which thus respond to the draught of air like enormous organ-pipes, and become for the time wind-instruments on a gigantic scale.'

We take leave to borrow another beautifully-related observation from this writer:—'In the autumn of 1828,' says he, 'when on a tour through Les Hautes Pyrénées, I formed one of a party, quitting Bagneres de Luchon at midnight, with an intention of reaching the heights of the Porte de Venasque, one of the wildest and most romantic boundaries between the French and Spanish frontier, from the summit of which the spectator looks at once upon the inaccessible ridges of the Maladetta, the most lofty point of the Pyrenean range. After winding our way through the deep woods and ravines, constantly ascending above the valley of Luchon, we gained the Hospice about two in the morning; and after remaining there a short time, proceeded with the first blush of dawn to encounter the very steep gorge terminating in the pass itself, a narrow vertical fissure through a massive wall of perpendicular rock. It is not my intention to detail the features of the magnificent scene which burst upon our view as we emerged from this splendid portal, and stood upon Spanish ground—neither to describe the feelings of awe which rivetted us to the spot, as we gazed, in speechless admiration, on the lone, desolate, and (if the term may be applied to a mountain) the ghastly form of the appropriately named *Maladetta*. I allude to it solely for the purpose of observing that we were most forcibly struck with a dull, low, moaning, Æolian sound; which alone broke upon the deathly silence, evidently proceeding from the body of this mighty mass, though we in vain attempted to connect it with any particular spot, or assign an adequate cause for these solemn strains. The air was perfectly calm. The sky was cloudless, and the atmosphere clear to that extraordinary degree conceivable only by those who are familiar with the elevated regions of southern climates. So clear and pure, indeed, that at noon a bright star which had attracted our notice throughout the gray of the morning still remained visible in the zenith. By the naked eye, therefore, and still more with the assistance of a telescope, any waterfalls of sufficient magnitude would have been distinguishable on a front base, and exposed before us; but not a stream was to be detected, and the bed of what gave evident tokens of being occasionally a strong torrent, intersecting the valley at its foot, was then nearly dry. I will not presume to assert that the sun's rays, though at the moment impinging in all their glory on every point and peak of the snowy heights, had any share in vibrating these mountain chords; but on a subsequent visit, a few days afterwards, when I went alone to explore this wild scenery, and at the same hour stood on the same spot, I listened in vain for the moaning sounds: the air was equally calm; but the sun was hidden by clouds, and a cap of dense mist hung over the greater portion of the mountain.'

There is no small difficulty in accounting for such sounds. They may be connected with changes of temperature; but how? Sometimes they may be produced at a great distance, but rendered audible by a form of the ground favourable for the collection of the rays of sound, so to speak. The wind is doubtless the instrument in many instances. Earthquakes, as we have seen, are another source of uncommon sounds, though how these should be produced in such circumstances we cannot say. Amidst this difficulty, it is satisfactory to refer to one class of such sounds for which an explanation has been attained.

On the east coast of the Bay of Suez, about three hours from Tor in Sinai, there is a sandstone ridge, at one part of which, where it is about 150 feet high, there is a steep acclivity named Nakuh, having much loose sand laid against it, the produce of the upper part of the hill. When the traveller ascends this sandy cliff, his ears are saluted with a sound which at first resembles the tone of an Æolian harp, then that of a hum-

ming-top, and finally becomes so loud, that the earth seems to shake. After many speculations about the cause of this phenomenon, the matter was set at rest by the distinguished naturalist Ehrenberg. 'He ascended from the base of the hill, over its cover of sand, to the summit, where he observed the sand continually renewed by the weathering of the rock; and convinced himself that the motion of the sand was the cause of the sound. Every step he and his companion took caused a partial sound, occasioned by the sand thus set in motion, and differing only in continuance and intensity from that heard afterwards, when the continued ascent had set loose a greater quantity of sand. Beginning with a soft rustling, it passed gradually into a murmuring, then into a humming noise, and at length into a threatening of such violence, that it could only be compared with a distant cannonade, had it been more continued and uniform. As the sand gradually settled again, the noise also gradually ceased.*' Mr James Prinsep, who also inquired into these sounds, states that the effect is produced by 'a reduplication of impulse, setting air in vibration in a focus of echo.' It is, in short, a phenomenon in acoustics.

There is a similar marvel at Reg-Ruwan, about forty miles north of Cabool, towards Hindoo Koosh, and near the base of the mountains. To quote the description of Sir Alexander Burnes:—'Two ridges of hills, detached from the rest, run in and meet each other. At the point of junction, and where the slope of the hills is at an angle of about 45 degrees, and the height nearly 400 feet, a sheet of sand, as pure as that on the seashore, is spread from the top to the bottom, to a breadth of about 100 yards. When this sand is set in motion by a body of people sliding down it, a sound is emitted. On the first trial we distinctly heard two loud hollow sounds, such as would be produced by a large drum. On two subsequent trials we heard nothing, so that perhaps the sand requires to be settled and at rest for some space of time before the effect can be produced. The inhabitants have a belief that the sounds are only heard on Friday; nor then, unless by the special permission of the saint of Reg-Ruwan, who is interred close to the spot. The locality of the sand is remarkable, as there is no other in the neighbourhood. Reg-Ruwan faces the south, but the wind of Purwan (*bád i Purwan*), which blows strongly from the north for the greater part of the year, probably deposits it by an eddy. Near the strip of sand there is a strong echo; and the same conformation of surface which occasions this is doubtless connected with the sound of the moving sand.'

An explanation being supplied in this case, we may hope to see all mysteries of the same kind in time cleared up.

FROM THE PIECE TO THE PATTERN.

PASSING through a couple of green gates at the bottom of a narrow street in the outskirts of Manchester, and very near the terminus of the North-Western Railway, we are at Hoyle's printworks in Mayfield, which is equivalent to saying that we have entered upon a scene displaying some of the finest and most scientific processes connected with the preparation of cotton for human apparel. 'Hoyle's prints' has become a household name, known alike to the wearer of the most exquisite and delicate of patterns, and to her who, whether for a tidy apron, or for a work-a-day dress, or for a Sunday gown, can pick out the genuine 'Hoyle's' out of a dozen imitations, with unerring accuracy. Although that forms by no means the sole description of article produced by this immense firm, yet the name is generally associated with the idea of some homely, useful, and cheerful lilac-patterned dress. The peculiar excellency of the establishment is un-

* Edinburgh New Philosophical Journal. Jan. 1830.

doubtedly this simple, unobtrusive, but indelible class of patterns, or 'style;' and as the demand for patterns of this sort has become as regular as the demand for apparel itself, continuing unaltered by the smiles of fashion or the frowns of caprice, it is probably correct to found upon the fortunate discovery of this dye the splendid reputation of these extensive works.

Mayfield is a little town of itself, and the various buildings, works, and reservoirs occupy no inconsiderable space in this portion of the City of Steam—the title being nowhere so well earned as here, where, from the open roofs of the dye-houses, torrents of steam soar up into the air. Upon the territory of the firm, in fact, a considerable number of cottages, for the workmen and their families, cluster together; and we were gratified to enter a capital school, well filled with boys and girls, the children of this print-village, so to write. The entrance is effected under a handsome clock-tower, forming at its base the porter's lodge. Crossing an open area, the visitor's attention is first caught by the large water-reservoirs placed on the boundaries of the premises. These are filters on a great scale: the plan is peculiar to these works. A great essential in securing a good and brilliant dye is to get water as free from iron and lime as possible. For this purpose sulphuric acid is often intentionally added, in small quantities, to precipitate the lime. The same end is effected in this instance by conveying all the water used in the establishment, by an aqueduct, from the engine-pump to the highest of the reservoirs, and there adding to it the refuse from some of the dye-vats. By this means all the iron and lime are deposited, and the water, descending through several beds of sand, &c. in the different filters, at length enters the reservoir, from whence it is drawn for the use of the dye-house.

Having now fairly entered the busy spot, we must proceed according to order, and to that end must first enter that portion of the works which is called the White Room, from the circumstance that the bleached 'pieces' are first brought to this place, to be submitted to one or two inspections, &c. before proceeding to the print-room and dye-house. In one division of this place was the examiner—her duty being to see that no knotty portions exist in the cloth, removing them with a scissors of peculiar form. We were amused at the rapidity and methodism with which the woman, by an alternate glance of the eye to one and to the other edge of the cloth, instantly detecting the least imperfection, removing it, and, machine-like, going on as before, pushing yard after yard over the board in front of her. In the next room were a number of females, seated in different portions of it, with a large number of pieces of the cloth before them, plying their needles in sewing them together at an extraordinary rate, and with a peculiarity of knack only to be learned by long experience. Fifteen pieces is the average number sewn together at their ends, making on the whole, if we reckon each piece at about 30 yards long, a length of cotton cloth of about 450 yards! The pieces are then folded up, and conveyed to a third department in this building. If the reader would be at the pains to examine the edges of the calico as thus folded, he would find them very uneven, many probably bent in, and creased. Unless these creases were removed, it would be next to impossible to print a dress evenly, and in all parts alike. The means of removal is very simple, but peculiar. A powerful and athletic man lays hold of the cloth, and standing before a stone placed at a particular angle, whisks the cloth in the air, and strikes it with a peculiar twist upon the edge of the stone. After beating the edges thus for a few times, they will be found, on examination, to be all smooth, and every crease taken out. One active

fellow told us he could despatch 600 of these compound pieces as his day's work. The calico is yet in folds, and retains a certain amount of dust and fine 'flue,' which must be removed before it can be fitted to receive the pattern. The reader must therefore accompany us, as, following the steps of our companions, we entered a very dusty and bustling apartment. Four or five curious machines were here arranged, and, in connection with the steam-engine shafts, were in rapid action. The end of the folded calico was taken up, and partly rolled upon a wooden roller. On the machine being set in motion, the cloth was wound up on this roller, at each end of which were heavy weights, by which means the roll acquired almost the solidity of wood; and in its passage it had to cross a couple of bars of iron, grooved diagonally, for the purpose of taking out any remaining creases, and also over a circular system of brushes, which revolve with great rapidity, and sweep every lightly-adherent particle from off the face of the fabric. The whole process is effected with a degree of rapidity which much surprises the uninitiated in the marvels of mechanism; and that which was formerly a slow, imperfect, and tedious process, is now effected in the space of a very few minutes with the utmost rapidity and certainty of result.

The roll of cloth is hurried to the print-room: thither let us accompany it. This is a beautiful new building, of considerable size, and some elegance of appearance. It forms a distinct division of the works, and its wonderful mechanisms are actuated by a distinct motive power from those of other portions of this extensive establishment. Ascending a short flight of steps, our ears already greeted by the tumultuous moving sounds which vibrated through the half-open door, we entered, and had displayed before us such a stirring prospect as we have rarely beheld. On the left-hand side, looking down the room, were eighteen or twenty of those beautiful inventions, the cylinder-printing machines, all in full work. We beheld our cloth-companion carried to the back of one, partly unwound, the machine set in action, and lo! it rises from the iron bosom of the apparatus a printed fabric: it passes through the ceiling, and we think it lost for ever to view, when, at the other side of the room, see the same piece descends, hot and dry, and, as one might think, ready for use, but not nearly so yet. Conceive of eighteen machines all performing the same evolutions; of eighteen fabrics entering them without spot or wrinkle, emerging covered with figures, spots, and marks of various hues and designs; of their again soaring up out of sight, and once more descending in smooth folds on the other side, and an imperfect idea of the singular scene before us may present itself. As the machines before us are, without question, the most important mechanisms in the whole of this interesting manufacturing process, they deserve to be fully understood; and that, we believe, may be very easily accomplished by a little attentive consideration of the following analysis of one of the most modern of them. There is, then, an upright framework of cast-iron, within the two sides of which the printing apparatus is contained; externally to it is the gear which connects the rollers, &c. with the shafting running under the floor; in the centre of the frame is a series of rollers, the most important of which is a copper cylinder, the lower side of which dips into a trough containing the colouring paste; at the back of the machine is the rolled cloth preparatory to printing; and rising from its front, the same cloth is seen imprinted with the peculiar device, and resting on an endless web of Mackintosh fabric, enters the room above by a longitudinal slit in the ceiling. To trace the cloth in its proper progress, we will commence with it behind. Unwinding from the roller, it makes a slight descent, and then enters into the machine between an under copper cylinder, the surface of which is engraved with the pattern—the under part of it dipping into the colour-trough, receives its charge of colour by that means—and an upper roller of wood, the surface of which is covered by the Mackintosh web: these

rollers being tightly screwed together, exercise great compression upon the cloth as it passes between them, and force it to take up every vestige of colour from the depressions in the surface of the cylinder. Appearing in the front, it is now found to have taken an accurate impression of the design on the copper, and its further stages of progress will come presently under our notice. At the side of the room are a number of vices, at which the machine attendants will be frequently seen at work, smoothing and straightening a long steel blade, like—if we may venture to draw the comparison—what ladies call, we believe, a 'busk;' a kind of iron substitute for the whalebone in stays. Reader, without that simple blade, all this costly mechanism would be utterly valueless, at least for printing purposes: that is the *doctor*. If the copper cylinder were allowed to dip into the colour, and then to be pressed against the tissue, the result would be, that a homogeneous broad band of the colour would remain on the fabric. What is wanted is, to remove all the colour from the surface of the engraved metal, yet to leave all the engraved portions charged with colour. Manifestly no ordinary wiper would or could effect this end. The smooth sharp edge of the doctor does it completely. The blade receives an alternate lateral motion by a crank; and resting, as it does, at a certain angle upon the surface of the cylinder, it smoothly scrapes away every particle of surface-colour in the most admirable manner. It is said to have received its odd name from the expression of surprise of a workman, who, seeing the inventor, after many trials of other methods of getting rid of surface-colour, take up a long-bladed knife, and, to his astonishment, finding it answer the purpose excellently, ejaculated, 'You have *doctored* it now, sir!' Each machine has two of these ferreous medical attendants: one—the one in question—is called the 'colour-doctor;' the other, which is placed in front of the cylinder, and is intended to free it from any cotton filaments which may have got upon it during the passage of the fabric over it, has the more congenial appellation of the '*lint-doctor*.'

Having, as we trust, made the construction of the single-colour cylinder-printing machine sufficiently clear, we shall now be able to comprehend, without difficulty, that yet more remarkable, and, at first sight, highly-complicated machine, which prints *five*, or even *six* colours, at the same time! If the reader can imagine that, instead of passing over one cylinder, the cloth passes in succession over one, two, three, or more, each dipping in troughs containing different colours, and each furnished of course with the doctor, he will have all the essentials before him of the compound machine. As may well be imagined, the paramount difficulty here is so to engrave the different patterns on each cylinder as that each spot of colour shall drop into its right place; and no ordinary exercise of ingenuity and patience is called for in the adjustment of the machine in the first instance. It is a beautiful spectacle when seen at work. You behold the smooth band of cloth enter in snowy purity, you watch it swiftly passing in a zig-zag direction over a number of cylinders, each charged with different colours, and each kept clean by its busy '*doctors*,' until at length it comes out covered with a pretty pattern, in which five or six colours glitter with most attractive brilliancy. The metamorphosis is as rapid as it is complete, from the unsullied piece of calico to the almost perfected pattern dress.

Stepping across to the opposite side of the room, we see, as we have said, the printed cloth come streaming down at a great rate; and, curious to say, it is laid in *regular folds* by machinery! It passes between a pair of wooden rollers placed at the end of a long swinging frame of iron; and this frame being made to swing to and fro by a crank, it directs the cloth passing between the rollers into similar folds, thus disposing what would otherwise be inevitably a confused heap of calico, requiring the constant supervision of one man to prevent its getting all over the floor, into smooth and even folds, in which form it lies, without irregularity, and can be easily removed by an attendant when the whole piece is printed. There are, it is true, minor ingenuities, but we delight to

mark them as indicative of the pervasion of a system of refined mechanism even to the most trifling particulars. We have thus seen, as far as this room is concerned, the beginning and the end of the piece. Ascending up stairs, we shall be able to see the intermediate process of '*drying*.' A few yards, and we are in a tropical climate! A blast of hot, suffocative air strikes the face, fills the clothes, and makes the skin tingle all over, and a few minutes must elapse before the impulse to plunge back again into the comparatively cold air of the room below can be fairly mastered. Then the heat ceases to be unpleasant—at least it was so with us. The evolution of this heat is due to the immense range of steam apparatus which fills the room from one end to the other. It consists of tall upright frames of cast-iron, to which are attached a number of flat iron cylinders filled with steam. The printed cloth, rising through the floor, is made to lie flat on a series of these hot chests, over which it is drawn; until, descending again on the other side, it is found to be quite hot and dry, and passes once more through the floor to the folding apparatus.

A very singular and interesting machine calls us to stop before finally quitting the printing-room. The men call it the '*gas-blue machine*.' As we had the privilege of witnessing the erection and first working of one of these ingenious machines, we shall briefly describe it. Up to the point where the cloth enters the machine, its arrangements are precisely those of the ordinary cylinder-print engines. Just, however, above the colour-doctor, a horizontal pipe, perforated with many holes, lies close to the revolving cylinder; this pipe is in connection with a gas-supply pipe, and by its means gas is blown on to the cylinder charged with colour just before the latter comes in contact with the cloth. In front of the machine is a flat box, glazed like a picture frame: immediately that the cloth leaves the copper cylinder, it enters between two tight lips of caoutchouc into this box, and may be seen through the glass moving upwards into a chest above, where it is rolled up—not passing into the drying-room, as in other cases. By ample pipes connected with a gas-meter, this flat box and the larger trunk are kept filled with an atmosphere of gas—the ordinary carburetted hydrogen of the streets—which, escaping in small quantities, renders its presence very perceptible to the senses of the bystander. At the top of the larger chest is an escape-valve, by which the gas is allowed at intervals to flow into the external air, to give place for a fresh quantity. This machine, which has been patented by Mr Woodcroft, is intended to produce a most beautiful and indelible blue colour on the print. The paste is of a peculiar kind, undergoing a certain decomposition when brought into contact with coal gas, and the result being the production of a very fine and lasting blue. The exact chemical processes which are concerned in this singular machine are not permitted to be divulged. It is very singular to see it at work, and to behold through the pane of glass the cloth, erst so fair and pale, deepening into a rich blue as it passes slowly upwards through the gaseous atmosphere, with the appearance at the same time of some pretty simple pattern on it. We believe that this invention, which is quite recent, has already proved a most valuable aid to the resources of the calico printer.

The rate at which the cylinder-printing machines execute their task is surprising when looked at in the aggregate. Some machines will actually print a mile of calico in an hour! or, to make it more intelligible to some of our fairer readers, each machine will print *three cotton dresses* in a minute! Supposing that fifteen of the machines in this room were to work uninterruptedly for only ten hours each day, and for six days in the week, they would be able to print cotton dresses in one such week for *one hundred and sixty-two thousand ladies*! How many, then, in a year? We believe the actual number of *miles* of calico printed by this eminent firm *alone* in a single year exceeds ten thousand, more than sufficient to measure the diameter of our planet with! The whole of the machines in this large apartment require the undivided energies of a couple of the most beautiful steam-engines

we have ever seen—on the locomotive principle—high-pressure boilers, and horizontal cylinders, each engine being estimated at twenty-five horse power. The engine-room was itself a miracle of neatness, nay, even of elegance: but we have more pressing claims on our attention.

A man comes, and taking up a heap of the folded prints, starts off for another department. Following hard in his wake, we entered the 'ageing-room'—such is really its odd-sounding title. The print is then handed over to a number of boys, who, taking the one end of it, hang it in folds upon hooks placed at short intervals apart. In this way the whole of an extensive room was converted, as it were, into a great laundry, the windows at the sides being all open, to permit a free current of air to pass through the entire space. On examining the pattern upon some pieces which have ended their stay, it is found to have undergone a considerable change of hue, from a pale fawn to a sort of rust colour. This is due to the action of the air upon the mordant—in this case usually a salt of iron. The intention of the ageing process is to produce a chemical decomposition upon the substance of the mordant, so as to induce its deposition upon the surface of the cloth in the form of an insoluble sub-salt, the better to endure the future operations to which the fabric is about to be exposed. Some care is necessary in this apparently simple process to effect the equable decomposition of the mordant all over the surface of the cloth; and we were assured by a practical man that occasionally the passage of the air across the fabric may be noted by the deeper colour of the outer folds, and the paler hue of the inner. The cloth takes four days to become, in dyers' language, properly 'aged.'

Accompany us now, gentle reader, to a region of mists, and rising damps, and fogs, on whose warm wet wings is the odour of madder and other dyes, to a place where dim spectres are to be seen wheeling about barrow-loads of reeking dresses; where the sharpest sight cannot for a while see a yard before the eyes; where there is such a dashing about of scalding water, such a clattering of deep-mouthed mechanism, and such a din and terrible sensation in the air, as if something were going awfully wrong, that you may be glad your companionship does not stretch beyond this page. Such is the 'beck' or dye-house into which we have now entered. A pile of calico from the ageing-room is cast at our feet; before us is a long wooden cistern, three parts filled with water, which is kept boiling by the influx of steam at the bottom. Just above it, and placed horizontally along it, with a bearing on each end of the cistern, is a wince or frame of wooden bars, which is made to revolve by machinery. Into the cistern are put a gallon or two of the manure from cattle. The cloth is then put in, and one end being laid over the wince, the latter being also set in motion, the cloth is seen to be wound over from one side to the other of the cistern, of course producing in its rapid progress no ordinary amount of splashing about. This, which is called, in the not-over-refined language of the dye-house, 'the dunging process,' is twice repeated. It is a most curious fact that, until lately, no rational explanation of this operation could be offered, nor was any substitute for the manure discovered. Even now the *modus operandi* is by no means clear. It appears certain that the manure owes its efficacy to its phosphates of soda and of lime, which appear to act in a peculiar manner, so as to remove the superfluous portions of the mordant from the cloth; and what is called 'dung substitute,' consisting of these two ingredients, is now largely employed in its place: we must mention, however, that it is a patent article. The cloth is then taken to another part of this busy place, and is washed by a similar wince and cistern, containing pure hot water, and is by this means freed from all impurities contracted during the last processes. It is thence removed to the 'dye-beck': this is an apparatus in all respects similar to the last—consisting of a revolving wince and cistern, which in this instance is filled with a boiling decoction of the dye, such as madder; and after whirling and splashing about in this hot fluid for a couple of hours, the cloth is then removed. It has now lost its

snowy whiteness, and has assumed a deep red hue, verging on purple; and a pattern can scarcely be detected on it, for the whole surface appears almost uniformly coloured. But excepting in the mordanted parts—that is, in the pattern which has been printed with a paste of 'mordant'—all this colour is fugitive: in these a true chemical union has taken place between the colour and the mordant, and the colouring matter has been deposited in the fibres of the cloth in the form of an insoluble precipitate; consequently no future washing can get it out, for the colour is, as it were, *locked in* within the fine tubes which compose the structure of the fabric; hence, indeed, the origin of the term *mordant*, or *biter-in*. Much might be said, and a vast amount of interesting matter could be adduced, upon the philosophy of dyeing, but it would swell this article to a most unreasonable length to introduce it. The grand principle has been just stated, and is easily extended to other instances; while for a variety of interesting chemical phenomena exhibited in the different processes, the reader may be referred to any of the valuable works on 'Applied Chemistry.'

The superfluous colour has now to be washed out, and a most singular machine is called upon to fulfil that office. The appropriate title for this immense washing-engine is the 'dash-wheel.' Along one side of a separate house, which might be termed the laundry, five or six of these dash-wheels are placed. They consist of large circular boxes, seven or eight feet in diameter, the interior of which is divided by boards into four compartments, with a large round hole looking into each of these divisions. These wheels are placed upon transverse axes, which are in connection with moving gear, and cause the whole frame to revolve round and round. The cloth is put into one of these compartments, a jet of pure water is allowed to flow into the interior of the machine near its centre, and the whole is then set in motion. The cloth is thus dashed about with considerable violence, while all the time a copious current of pure water flows over it; and when taken out, it is found to have lost a large portion, though not all, of its superfluous colour. It is taken back to the dye-house, and washed in a dilute solution of chloride of lime: this is called 'clearing.' The dash-wheel once more receives it, and now it is fit for apparel as far as colour goes. But it is reeking with water. This is expelled by a most ingenious contrivance called a hydro-extractor, or patent drying-machine. The dripping folds are put into a hollow circular wheel with a perforated margin; by means of speed-cones this is made to revolve with a gradually-accelerated motion until its revolutions reach a frightful rapidity. On stopping it, after a few minutes, it is found that the centrifugal force has made every particle of water fly from the cloth, and it is almost as dry as tinder! The cloth is then passed between two wooden rollers, revolving in a trough filled with starch: it goes up what is called a 'Jacob's ladder,' an endless band with shelves on it, into the steam-drying room. In this place is a large apparatus consisting of a number of cylinders filled with steam, under and over which the piece is wound, until it comes out smooth and dry. It is then folded, put in a hydraulic press, and tied, and the impatient horse in the dashing-cart outside receiving his load, carries it from Mayfield to the railway, and the railway scatters the wonderful production to the very ends of the earth.

This is, however, but a sketch of the processes concerned in the production of the very simplest patterns: cloth which receives patterns containing four or five colours, often goes through twenty or thirty different operations before it is finished, the number, complexity, and variety of which makes it a matter of astonishment that the articles can be produced and sold under anything but a most extravagant price. The copper cylinders on which the pattern is engraved are stored up in a separate apartment of considerable size, said to contain cylinders to the value of £60,000! Adjoining it is also a long and even elegant room, in which the designers and girl-engravers work. The works comprise a vast number of other departments, such as pumping, workshops, tool-repairing, smithies, madder-grinding, &c. the most vitally-

important of which is the extensive and beautifully-fitted-up chemical laboratory, where various experiments are conducted by a scientific chemist, and where all the dyes are prepared. This place contains a number of admirable machines for grinding, evaporating, mixing colours, &c. which it would be vain to attempt to describe. Suffice it to say, that it is the very heart of the whole manufacture, and upon the skill practically manifested here depends the entire success of the vast establishment. To give the reader a concluding idea as to the immensity of these works, it may be stated that they produce in a single year cotton dresses for a million and a-half of human beings!

AN INCIDENT IN THE PENINSULAR WAR.

ONE evening at our club we had the satisfaction of hearing Captain Marmaduke Smith relate an adventure in which he had been concerned in Spain, and which I shall try to give as nearly as possible in the language of the narrator. The reader is aware, for he has already made the captain's acquaintance, that he was somewhat of an oddity, and his story on this occasion was suggested by a hot discussion among us on the subject of patriotism.

'Don't tell me of patriotism,' said the captain: 'I have seen such queer exhibitions of the article in my day, that I am pretty well tired of hearing anything more about it. I could give you a story of Spanish patriotism that would astonish you; however, it's no use talking of the affair.'

'The story—let us have the captain's story by all means,' replied several voices. 'Come, captain, begin.'

'Well, well, if I must, I must, though I would rather have the matter forgotten. You of course all know that I am not exactly an Englishman?'

'Indeed! We always thought—'

'Never mind; I shall explain. My father was a Scotsman, my mother was an Irishwoman, and I was born in Gibraltar; so that you see I am an Anglo-Scoto-Irish Spaniard—a nondescript animal—though I hope not the worse subject of her Majesty, God bless her! By my father, who was a mariner at Gibraltar, I was sent to England for my education; and in consequence of my great merit—ahem!—a commission was easily got for me in the army. Well, that is a good while ago now. I served in the Peninsula, and was promoted—mark you, *not* by brevet. The Peninsula, you will observe, was a sort of native country to me—I spoke Spanish as fast as English. During one of the lulls in the campaign of 1811 I got leave of absence in order to visit Gibraltar. My father and only parent was lying dangerously ill, and requested my presence. Before I got to Gibraltar, he had died, leaving me his sole heir, which was a great consolation. When I came to look into his property, I found that it included a handsome schooner, the "Blue-Eyed Maid," which lay in the harbour, loaded with a capital cargo of printed cotton goods. The craft was waiting for a skipper, and none could be had. An idea struck me—"Why not turn skipper myself for the occasion?" The voyage was designed to be only as far as Bilboa—a regular smuggling transaction. I need hardly tell you, for all the world knows it, that Gibraltar is useful to us chiefly as a smuggling depot. The Spaniards want our goods; their government will not let them buy them in a regular way; and we, kind creatures, let them have them without giving any trouble to the customhouse. Now, here was a fine opportunity for me distinguishing myself as a contrabandista. My leave of absence having yet some time to run, I determined on taking the command myself; for although I had every proper confidence in Bill Jenkins the mate, yet knowing the weakness of human nature, and especially of smuggling human nature in such cases, I judged it might be as well to be my own cashier. On Christmas eve everything was ready for a start; the anchor was

atrip, and a fresh breeze was blowing from the southwest, which promised, if it did but last, a swift and pleasant run. I had just reached the bottom of the flight of rock steps leading to the signal station, where I had been to take a last look at the weather, when I was accosted by an old, odd, withered-looking gentleman—his hair and beard white as snow, and dressed in an old-fashioned grandee suit of velvet, with a short cloak over his shoulders, and a Spanish cocked-hat and feather on his head. He had a letter from a well-known merchant of Gibraltar, recommending him as a safe, trustworthy gentleman. His object, he explained, was to procure a passage in the "Blue-Eyed Maid" to Bilboa, then in the occupation of the French. As our rendezvous was a little to the south of the mouth of the Ebro, I had no difficulty in acceding, for a "consideration," to his request. An hour afterwards, we were on board, and I had an opportunity of more closely observing our new companion. He seemed a stunted, dried-up specimen of grandee pedigree and arrogance. He could not be less, judging from his palsied limbs, tremulous shrill voice, and shrunken features, than eighty years of age. His eyes, too, were filmy and dull, except when anything occurred to rouse him—an allusion to the French especially—and then a fire would glare out of the old decaying sockets—whether of heaven or the other place this story will best tell—enough to scorch one. He looked at such times for all the world like an Egyptian mummy animated by a fiend from the bottomless pit.

'We were soon under weigh, and cracking along at a spanking rate. The old Don kept very quiet, giving little or no trouble, except that some one or other of us was continually tumbling over him; for the restless creature would totter about the deck all day and nearly all night, muttering to himself, and every now and then irreverently flapping down on his knees. This conduct at last greatly scandalised Bill Jenkins, who argued that a man who threw out such an enormous number of that sort of signals must have an uncommon queer cargo to run; and Bill darkly hinted that if extra bad weather should come on, or any out-of-the-way mishap occur, he should know who to thank for it. Nothing, however, happened contrariwise till we were within a hundred miles of our destination, when, just as day broke, the look-out hand reported a strange sail on the weather-beam. All eyes and the only glass on board were immediately turned in the direction of the stranger, who finally proved to be a French war corvette. Bill Jenkins glanced at me, and then at the Spaniard, as much as to say, I told you what would come of having that precious rascal on board; and then made preparations to hoist every stitch of canvas the schooner could carry. But spite of all our exertions, the corvette gained rapidly upon us, and the prospect of a French prison became momentarily more and more distinct, and apparently inevitable. Our grandee seemed struck with utter madness: he stormed, raved, gesticulated, and execrated the advancing ship with a fury scarcely human! As something more to the purpose, we were preparing, with sorrowful hearts, to throw over the best and heaviest of the cargo, in order to lighten the schooner, when Jenkins, who had gone up with the glass to the foretop, sung out—"Avast heaving there; here comes a customer for the Frenchman—hurra!" We all ran to the side, and gazed to where Bill's arm pointed; and there, sure enough, about four miles a-head—the wind was right on our beam—was a British ship of war, just rounding a headland, and coming on like a race-horse. Up went our ensign—we had hitherto modestly concealed it—in a brace of shakes; we crowed out three lusty cheers, and fired our two little brass popguns, as valiant as turkey-cocks, at the corvette. As soon as the Frenchman perceived his new friend, he luffed up into the wind, and seemed for a few minutes doubtful whether to show fight or a clean pair of heels. The British vessel was the "Scorpion" sloop

of war, and about a fair match for the gentleman who had so nearly snapped up my father's son and his inheritance of marketable sundries. But the Frenchman finally made up his mind for a tussle. In little more than ten minutes the "Scorpion" swept close by us, and we were hailed from the quarter-deck with, "What schooner's that?" "The Blue-Eyed Maid of London," was the prompt reply. "Heave to, and wait here till our return," was the as quick rejoinder. "Ay, ay, sir!" shouted Bill Jenkins, at the same time respectfully touching his hat, and adding in a lower voice, "We'll see you smothered first!" In those days, gentlemen, merchant vessels were by no means desirous of too intimate an acquaintance with his majesty's cruisers. They had a pestilential way of carrying off the best hands, and both skippers and sailors, like the sheep in the story-book, used to make ugly comparisons between the wolves and the shepherds: so we kept on under as much sail as the sticks would bear. The appearance of the British cruiser had changed the delirious rage of the Spaniard into the wildest joy; and when the fight, of which we had a capital view at a pleasant and rapidly-increasing distance—a circumstance, let me tell you, which adds wonderfully to the agreeableness of such glorious spectacles—indeed, to tell the honest truth, I doubt if they are ever thoroughly enjoyed in any other manner'—

'I always understood,' interrupted a thin, squeaky voice, struggling through the smoke from a corner of the room; 'I always understood that warriors delight in battle.'

'Did you, Tape?' rejoined Captain Smith: 'then your innocence has been shamefully imposed upon. A great pleasure over a battle may be; but ball-favours in actual course of distribution are anything but pleasant to the two-legged targets expectant. He who thinks otherwise, you may depend upon it never played at the game. But to return to my story. The Spaniard, I was saying, capered like a maniac—which in truth he was, and that's the best thing, you'll admit presently, can be said of him—at every mishap that befell the Frenchman's spars or rigging-gear; and when, after both ships had been some time hull down, Bill Jenkins announced from the mizzen-truck, with a roar like a small hurricane, that the tricolor was struck, he fairly yelled with delight, and was so overcome with joy that he fainted away, and had to be carried below. A man must have lived in Spain in those days to know to what a pitch national animosity can be carried; and this Senor Cortina, to add to his aversion for the French as the invaders of his country, had suffered, I afterwards learned, personal wrong and violence at their hands. His château, after a foolish resistance, had been sacked and burned, and his daughter ill-treated by the savage soldiery. After a few hours' repose he was again on deck, ejaculating as before; and by what I could piece out from detached sentences I now and then overheard, I believed him to be imploring strength and help for the accomplishment of some great and awful duty which he had made a vow to perform.

'Nothing further occurred till we made the entrance of the Ebro, where we stood on and off for a couple of days and nights. At last our signals were answered, and we made a successful run of the entire cargo. As soon as I had pocketed the cash, I paid the crew liberally, and despatched the schooner back to Gibraltar, intending to join my regiment over land. I lingered a few days at the *podesta*, where my late passenger had put up, and became, in consequence, an actor in the affair which followed.

'One day, after a late dinner, I told Senor Cortina who I was, and the occupation I usually followed. His dull old eyes flashed with joy, and having first pressed a considerable present on my acceptance, and hinted that he wished to confer privately with me in the morning, he retired to his chamber. The sight and feel of the money effected a decided change for the better in my opinion of the old gentleman's rabid pa-

triotism, and I began to think somewhat highly of one who evinced such touching gratitude towards an ally. The next morning I was summoned immediately after breakfast to his apartment, where he sat as cold, stern, and rigid as an iron image. All his flightiness was gone, and he was as solemn as a judge. His first sentence was a stunner! "I want you, Mr Smith, to convey a message to an officer of the garrison of Bilboa." "Bilboa?" says I, almost lifted off my feet with surprise. "Yes," he replied, cool as a cucumber—"Bilboa. The service is, I am aware, dangerous; but the reward shall be ample." This was to the point, and sensible. "What is the officer's name, senor?" "Colonel Delisle," he replied, naming one of the most active and successful officers in King Joseph's service. He was, I had before heard, a Spaniard born, though he now bore a French name; that, I believe, of his wife. You must know, gentlemen, that many Spaniards, through dislike of the old corrupt system of government, which, they said, had ruined the country, joined the intrusive monarch, as he was called, in hopes of establishing through him a more enlightened rule. They were called *Afrancesados*, and were more bitterly hated by the "patriots" than were the French themselves. "Colonel Delisle!" I exclaimed; "why, what on earth can you have to say to him?" "He is my son," was the reply. I was dumbfounded. "Yes," resumed the old man, his cold, hard eye glittering like a serpent's, "Colonel Delisle is my son; and as I feel that I have not many weeks, perhaps not many days, to live, I wish to see him once more ere I die. I wish you to convey this message to him. I cannot enter Bilboa myself, for a price is set upon my capture. You are used to such enterprises; and, as I said, the reward shall be ample. This ring," he added, taking an old family affair from his finger, "will accredit your message." Well, I at last consented to undertake the commission, and immediately set about my preparations. They were completed in about an hour; and in the afternoon of the same day I arrived safely at Bilboa, distant about eleven miles from where we were stopping. I soon succeeded in procuring an interview with the colonel, a fine soldierly-looking man, and at once imparted my message. He was greatly agitated, and pressed me with a hundred questions, which I answered or evaded as well as I could. Finally, he agreed, though with much hesitation, to meet his father, for whom he seemed to entertain a strong affection, a few miles without the town on the following day. From his inquiries concerning his sister, I gathered that he was ignorant of the burning and sacking of his paternal mansion, and I left him in happy ignorance on the subject.

'I got safely back to Senor Cortina; and when I informed him of the result, a flash as of demoniac joy lighted up his withered features, and fading in an instant, left them paler, stonier than before. I could not comprehend his strange expression of face; but the faintest suspicion of his motives never crossed my mind. It was arranged that I should meet the colonel, and conduct him to a small farmhouse, about half a mile distant from the place of rendezvous, where the senor would be in waiting.

'Evening was rapidly closing in as I next day reached the appointed spot. I gave the concerted signal, and a tall figure immediately emerged from the concealment of a large clump of stunted fir-trees: it was the colonel! He expressed surprise at not seeing his father; but, satisfied with my explanation, agreed at once to proceed to the farmhouse. We set off at a smart pace, and were just entering a narrow sort of gorge leading through some intervening hills, when thirty or forty muskets were suddenly presented at us by a number of men who seemed literally to start out of the ground. The colonel glared fiercely for an instant in my face; and muttering "Accursed traitor!" sprang wildly up the declivity. The attempt was useless: he was instantly seized. Our arms were pinioned; and having first searched and stripped us of all the money and valuables

we had about us, we were placed in the centre of the party, and marched off at a brisk pace. After about three hours' smart walking, we arrived at the headquarters of the guerilla party into whose hands we had fallen. It was a wild-looking spot, encircled on all sides by bare and rugged hills. The night was cold, dark, and stormy, and the only objects we could discern were several stacks of piled muskets, baggage and horse-furniture scattered here and there, and a rude portable table, near which was placed a number of equally rude camp-stools. Not a word was spoken; and the only sounds we heard for a space, I should think, of more than twenty minutes, were what I took to be signal whistles replied to at greater and lesser distances. At the end of that time men wrapped in cloaks stalked, silently as shadows, into the space in front of us, and seated themselves in grim silence near the table or trestled boards. I counted fifteen of them, when a whistle louder and shriller than any that had preceded it announced the arrival of the chief of the pleasant party. He took his seat in the centre of them. Pine torches were then lighted, at which the grim gentlemen kindled their cigars, and business commenced in very dangerous earnest.

"Who and what are you?" said the chief, addressing me in a voice as rough as a nutmeg-grater. I informed him. The explanation was satisfactory, for he immediately said, "You are free." I started with joyful surprise, and was just about to claim restitution of my stolen property, when I was silenced by a peremptory, "Who is your companion?" This was a poser; but as I had anticipated some inquiry of the sort, I answered pretty readily that he was a gentleman living in Bilboa, with whom I had some pecuniary transactions; and that we were proceeding to a neighbouring farmhouse to settle matters when we were arrested. For the truth of which statement, I added, one Senor Cortina, who was still no doubt waiting there for us, would readily vouch.

A meaning smile, as I uttered the senor's name, gleamed over the rugged features of the chief, and was reflected on the countenances of his companions. Puzzled and alarmed, I stopped abruptly, and held my peace.

"Is this fellow's story true?" said the president of the court, addressing the colonel.

The colonel was silent for a few seconds, and then said, "Yes; I am a peaceable and loyal inhabitant of Bilboa."

"Does any one know him?" said the chief, looking around inquiringly. "We must have no mistake in this business." There was a long and anxious pause; but no one answered.

"I am sorry for it," muttered the president, as if speaking to himself; "but it must be done." He then whispered one of his companions, who instantly rose, and quickly disappeared in the surrounding gloom.

A painful silence ensued. The colonel's countenance was dark and troubled, and I am pretty sure he partly guessed what was coming. At last two figures approached the circle. They were the guerilla officer returning to his seat, accompanied by Senor Cortina! I could scarcely believe my eyes, and trembled in every joint of my body. The old man looked harder, colder, stonier than ever; but as his eye fell upon his son, the same fierce gleam I had before so frequently noticed flashed from his eyes, and his features worked with convulsive passion. The fit lasted but a moment, and he was calm again. The chief had risen at his approach, and his manner, as he invited the senor to be seated, indicated both respect and compassion. The old man declined the proffered seat, and remained erect, motionless, and rigid.

"Is the prisoner the man whom we seek?" asked the president in a nervous, agitated whisper.

"Yes," replied Senor Cortina, in a distinct, but somewhat hurried voice and manner, like a man repeating a lesson he has long conned over, and is anxious to be

done with. "He is Colonel Delisle, as he calls himself, in the usurper's service. His real name is Cortina: he is my son, and a Spaniard by blood and birth. He is one of the most active foes of his suffering countrymen. I was on my way to England with my daughter, who, you may have heard"—The old man paused, and again the expression of insane hate and fury flitted across his features. Recovering himself, he proceeded, but more hurriedly even than before, "She died at Gibraltar, and I returned here with that worthy man (pointing to me), in order to atone by this sacrifice for the crime of having given birth to a traitor."

A deathlike silence followed. The stern countenances of the members of this rude court of military justice, as seen by the fitful glare of the torches, assumed a gloomier and more savagely-sinister aspect as the old man spoke; but not a word or gesture of comment followed. Senor Cortina, upon a gesture from the president, was led away.

"You hear, Colonel Delisle?" said the chief, as soon as he supposed the father was out of hearing.

"I do," replied the victim, mastering, as well as he could, the frightful emotion which the old man's denunciation had excited. "I do, and perceive that I am hopelessly entrapped into the power of remorseless ruffians by that mistaken, much-to-be-pitied old man, whom may God forgive, as I do! I ask not for mercy from such as you; indeed I know it would be bootless to do so; but I tell you to your teeth that my love and devotion to Spain are as strong and pure as yours can be. I sought to liberate her—with foreign help, 'tis true, for how else could it be done?—from the vilest tyranny that ever debased and ruined a gallant nation; you fight to restore her, also by foreign aid, to thralldom of both soul and body. You are impatient: well, then, your sentence—and be brief!"

"It was soon passed—death without delay.

"Do you wish for a priest?" said the chief.

"An impatient gesture of refusal was the only answer. Half-a-dozen musketeers, at a signal from one of the officers, stepped forth from the ranks behind us: the colonel drew himself fiercely up, and looked them sternly and steadily in the face: the chief waved me away: the words, "Make ready, present, fire!" were rapidly given: the death-shots rang sharply on the silence of the night; and the colonel fell stone-dead on the greensward. A soldier tapped me lightly on the shoulder, and bade me follow him. I mechanically obeyed, and soon found myself on the high road, where my guide, having first generously restored me three of the many gold pieces I had been robbed of, left me. I was so knocked up, so bewildered by what I had witnessed, that I sought shelter and repose in the first house I came to; and it was not till the fourth day after the colonel's execution that I arrived at my old lodgings. I was there informed that Senor Cortina had returned, bringing with him his son's body, which was interred in a neighbouring burying-ground, and that the old man had since passed most of his time there. I waited several hours for him, as I had not yet touched the reward, which, although I wished to Heaven I had never earned, still, as the mischief was done, I felt a natural desire to receive: but finding he did not arrive, and feeling anxious to be gone, I proceeded to the churchyard in search of him. As I approached, I saw him kneeling, with his back towards me, by the side of a new-made grave, at the head of which was a wooden crucifix. I called to him, at first gently, then louder: receiving no answer, I went up, tapped him on the back, and found that he was dead! The unnatural furor which had preyed on him had at length quenched the last spark of life. He was a victim to his own vengeful passions!"

"What a horrible transaction altogether!" said one or two of the party.

"Yes," said the captain in conclusion, "it was an affair I shall never forget, although I do try to banish it from recollection. It was, however, after all, only one of

thousands of cases of family desolation and murder that occurred during the Peninsular war. Gentlemen, good-night!

THE MYSTERY OF IRELAND.

IRELAND is a mystery to all mankind. Amidst the mazes of its erratic course, there is but one thing to which it is constant—disaffection to England. Let the government be severe or mild, partial or impartial, let the English feed its starving millions, or hesitate about even so small a grant as fifty thousand pounds, Ireland hates England all the same. One could almost suppose that it keeps itself wretched, only to be an annoyance to England in the way of throwing discredit upon it. In no other way can we account for that strange conduct of the sister island which seems so nearly to transform into an expression of real design the celebrated illustration of the national grammar—*'I will fall, and nobody shall help me.'*

Amongst the many attempts that have been made to explain the mystery, we wonder that nobody has ever suggested the idea that offended self-love is the chief thing at the bottom of it. There is a self-love in nations and in provincial groups of people, as well as in individuals. Enter any little town, and on coming into intimate conversation with the people, you will find them to have some sense of its importance—its church celebrated for this, its schools for that, uncommon ale brewed in it, some of the cleverest men at the bar natives of it, and so forth. In any small provincial nationality, this feeling is usually very intense: their slumping their distinct name and character with any greater body of people they always look upon as a kind of favour which ought to be handsomely acknowledged. It requires some nice management on the part of the great mass to keep them sweet—at least till new and superior feelings have come to supersede or regulate those originally manifested. It is very much the same case, indeed, as that of having relations in a somewhat lower social grade, and who have but a limited acquaintance with the ways of the world. All must have felt how difficult it is, with the best feelings, to keep on a perfectly amicable footing with such persons. No common observance of polite rules will serve, for they do not know them, and cannot measure their force. No scrupulous abstinence from every positive ground of offence will do. The composed and easy familiarity which suits with equals will not answer here. There is a restless jealousy of slight to be overcome, an uneasy sense of inferiority to be soothed and lulled asleep. Without something, therefore, like a violent good-will, and expressions which in another case would appear exaggerated, it is scarcely possible to keep things right. The matter may be said to resolve itself into the well-known maxim, that the first requisite for our standing well with any one is to put him at ease with himself. Now nationalities may be so circumstanced with respect to others, as to be uneasy on the score of self-love. It may be a childish feeling, but for the time they cannot help it. Ireland is, we think, in this predicament. It is just at that point in civilisation when such puerilities have a force. Scotland, being geographically connected with England, and having had the grace of sending a king to take rule in the larger country, had less to overcome at the first, and her superior civilisation has quickly done the rest. But Ireland is still thrilling with the poor-relation jealousy, and, strange as the case may seem, we suspect that little else is required to account for the extraordinary state of that unhappy country.

If such be a true view of the case, the required remedy would appear to be simpler than has been generally supposed. England must set herself, with what zeal she may, to smooth down the ruffled plumes of her

unfortunate sister. As there is a cheap defence of nations, so there may be a cheap cure for some of their maladies. Kind words would go farther than money, for they inflict no sense of obligation. Some expressions tending to soothe the self-esteem of Ireland with regard to her political status are called for. A royal visit would be a grand stroke of policy. We are not even sure but that it would be worth while to encounter the chance of some inconveniences, in order to obtain the obvious benefits of a national council of some kind seated in Dublin, at least to deliberate, if not to legislate, on Irish public business. Say it were a mere toy, yet we know that toys have their effect; and there may be cases in which no higher influence would be of avail. Anyhow, whatever may be the particular measures to be taken, they must certainly, if we are right in our premises, be of the kind here indicated. We can imagine some great minister taking up such a policy, and, by a few dexterous measures, putting all to rights. It was by such generous yet simple means that the Scottish Celts were gained over to be the friends of the English government in the middle of the last century.

THE BICÊTRE IN 1792.*

It was in the latter end of 1792 that Pinel, who had been appointed some time before medical superintendent of the Bicêtre, urgently applied for permission from the authorities to abolish the use of the irons with which the lunatics were then loaded. Unsuccessful, but resolved to gain his object, he repeated his complaints with redoubled ardour before the Commune of Paris, and demanded the reform of this barbarous system.

'Citizen,' replied one of the members of the Commune, 'to-morrow I will pay you and the Bicêtre a visit. But wo to you if you deceive us, and are concealing the enemies of the people amongst your madmen!'

The member of the Commune who spoke thus was Couthon. The next day he arrived at the Bicêtre.

Couthon was himself perhaps as strange a sight as that which he had come to see. Deprived of the use of both his legs, he was always carried about on men's shoulders; and thus mounted and deformed, he, with a soft and feminine voice, pronounced sentences of death; for death was the only logic at that moment. Couthon wished to see, and personally to question, the lunatics one after another. He was conducted to their quarter of the building; but to all his questions he received but insults and sanguinary addresses, and heard nothing amidst the confused cries and mad howling but the chilling clank of the chains reverberating through the disgustingly dirty and damp vaults. Soon fatigued by the monotony of the spectacle and the futility of his inquiries, Couthon turned round to Pinel, and said, 'Ah, citizen, are not you yourself mad to think of unchaining such animals?'

'Citizen,' replied the other, 'I am convinced that these lunatics have become so unmanageable solely because they are deprived of air and liberty, and I venture to hope a great deal from a thoroughly different method.'

'Well, then, do what you like with them; I give them up to you. But I fear you will fall a victim to your presumption.'

Now master of his actions, Pinel commenced the next day his enterprise, the real difficulties of which he had never for a moment disguised to himself. He contemplated liberating about fifty raving madmen without danger to the more peaceable inmates. He decided to unchain but twelve as a first experiment. The only precaution he judged necessary to adopt was to prepare an equal number of waistcoats—those made of stout linen, with long sleeves, and fastened at the back, by means of which it is easy to prevent a lunatic doing serious mischief.

* From the account of Dr Scipion Pinel, son of the humane and scientific physician of that name.

The first whom Pinel addressed was the oldest in this scene of misery. He was an English captain; his history was unknown; and he had been confined there for forty years. He was considered the most ferocious of all. His keepers even approached him with caution; for in a fit of violence he had struck one of the servants with his chains, and killed him on the spot. He was more harshly treated than the others, and this severity and complete abandonment only tended still more to exasperate his naturally violent temper.

Pinel entered his cell alone, and addressed him calmly. 'Captain,' said he, 'if I take off your chains, and give you liberty to walk up and down the yard, will you promise me to be reasonable, and to injure no one?'

'I will promise you; but you are making game of me. They are all too much afraid of me, even you yourself.'

'No, indeed, I am not afraid,' replied Pinel; 'for I have six men outside to make you respect me: but believe my word; confide in me, and be docile. I intend to liberate you, if you will put on this linen waistcoat in place of your heavy chains.'

The captain willingly agreed to all they required of him, only shrugging his shoulders, and never uttering a word. In a few minutes his irons were completely loosened, and the doctor and his assistants retired, leaving the door of his cell open.

Several times he stood up, but sank down again: he had been in a sitting posture for such a length of time, that he had almost lost the use of his limbs. However, at the end of a quarter of an hour he succeeded in preserving his equilibrium; and from the depth of his dark cell he advanced, tottering towards the door. His first movement was to look up at the heavens, and to cry out in ecstasy, 'How beautiful!' During the whole day he never ceased running up and down the stairs, always exclaiming, 'How beautiful! How delightful!' In the evening he returned of his own accord to his cell, slept tranquilly on a good bed which had been provided for him in the meantime, and during the following two years which he spent at the Bicêtre he never again had a violent fit; he even made himself useful, exercising a certain authority over the other lunatics, governing them after his fashion, and establishing himself as a kind of superintendent.

His neighbour in captivity was not less worthy of pity. He was an old French officer, who had been in chains for the past thirty years, having been afflicted with one of those terrible religious monomanias of which we even now-a-days see such frequent examples. Of weak understanding and lively imagination, he conceived himself destined by God for the *baptism of blood*—that is to say, to kill his fellow-creatures, in order to save them from hell, and to send them straight to heaven, there to enjoy the felicity of the blessed! This horrible idea was the cause of his committing a frightful crime. He commenced his homicidal mission by plunging a dagger into the heart of his own child. He was declared insane, confined for life in the Bicêtre, and had been afflicted for years with this revolting madness. Calmness at length returned, but without reason: he sat on a stone silent and immovable, resembling an emaciated spectre of remorse. His limbs were still loaded with the same irons as when first he was confined, but which he had no longer strength to lift. They were left on him as much from habit as from the remembrance of his crime. His case was hopeless. Dr Pinel had him carried to a bed in the infirmary; his legs, however, were so stiff and contracted, that all attempts to bend them failed. In this state he lived a few months longer, and then died, without being aware of his release.

The third presented a strange contrast. He was a man in the prime of life, with sparkling eyes; his bearing haughty, and gestures dramatic. In his youth he had been a literary character. He was gentle, witty, and had a brilliant imagination. He composed romances, full of love, expressed in impassioned language. He

wrote unceasingly; and in order to devote himself with greater ardour to his favourite compositions, he ended by locking himself up in his room, often passing the day without food, and the night without sleep. To complete all, an unfortunate passion added to his excitement: he fell in love with the daughter of one of his neighbours. She, however, soon grew tired of the poor author, was inconstant to him, and did not even allow him the consolation of a doubt. During a whole year the anguish of the poor dreamer was the more bitter from concealment. At length, one fine day he saw the absurdity of his despair, and passing from one extreme to the other, gave himself up to every kind of excess. His reason fled, and taken to the Bicêtre in a raging fit, he remained confined for twelve years in the dark cell where Pinel found him flinging about his chains with violence. This madman was more turbulent than dangerous, and, incapable of understanding the good intended to him, it was necessary to employ force to loosen his irons. Once he felt himself at liberty, he commenced running round and round the courtyard, until his breath failing, he fell down quite exhausted. This excitement continued for some weeks, but unaccompanied by violence, as formerly. The kindness shown to him by the doctor, and the especial interest he took in this invalid, soon restored him to reason. Unfortunately he was permitted to leave the asylum and return to the world, then in such a state of agitation: he joined the political factions of the day with all the vehemence of his passions, and was beheaded on the 8th Thermidor.

Pinel entered the fourth cell. It was that of Chevingé, whose liberation was one of the most memorable events of that day.

Chevingé had been a soldier of the French Guard, and had only one fault—that of drunkenness. But once the wine mounted into his head, he grew quarrelsome, violent, and most dangerous, from his prodigious strength. Frequent excesses caused his dismissal from his corps, and he soon squandered his scanty resources. At length shame and misery plunged him in despair, and his mind became affected. He imagined that he had become a general, and fought all who did not acknowledge his rank. It was at the termination of a mad scene of this kind that he was brought to the Bicêtre in a state of fury. He had been chained for ten years, and with stronger fetters than his companions, for he had often succeeded in breaking his chains by the mere force of his hands. Once, in particular, when by this means he had obtained a few moments of liberty, he defied all the keepers together to force him to return to his cell, and only did so after compelling them to pass under his uplifted leg. This inconceivable act of prowess he performed on the eight men who were trying to master him. From henceforth his strength became a proverb at the Bicêtre. By repeatedly visiting him, Pinel discovered that good dispositions lay hidden beneath violence of character, constantly kept excited by cruel treatment. On one occasion he promised to ameliorate his condition, and this promise alone had greatly tranquillised him. Pinel now ventured to announce to him that he should no longer be forced to wear his chains. 'And to prove that I have confidence in you,' added he, 'and that I consider you to be a man capable of doing good, you shall assist me in releasing those unfortunate individuals who do not possess their reason like you. If you conduct yourself properly, as I have cause to hope you will, I shall then take you into my service, and you shall not leave me.'

Never in the mind of man was there seen so sudden or complete a change: the keepers themselves were forced to respect Chevingé from his conduct. No sooner was he unchained, than he became docile, attentive, watching every movement of Pinel, so as to execute his orders dexterously and promptly, addressing words of kindness and reason to those lunatics with whom he had been on a level but a few hours previously, but in whose presence he now felt the full dignity of liberty.

This man, who had been unhumanised by his chains during the best years of his life, and who doubtless would have dragged on this agonizing existence for a considerable length of time, became at once a model of good conduct and gratitude. Frequently in those perilous times he saved Pinel's life; and one day, amongst others, rescued him from a band of ruffians, who were dragging him off *à la lanterne*, as an elector of 1789. During a threatened famine, he every morning left the Bicêtre, and never returned without provisions, which at that moment were unpurchaseable even for gold. The remainder of his life was but one continued act of devotion to his liberator.

Next room to Chevingé, three unfortunate soldiers had been in chains for years, without any one knowing the cause of this rigour. They were generally quiet and inoffensive, speaking only to each other, and that in a language unintelligible to the rest of the prisoners. They had, however, been granted the only privilege which they seemed capable of appreciating—that of being always together in the same cell. When they became aware of a change in their usual mode of treatment, they suspected it to proceed from unfriendly motives, and violently opposed the loosening of their irons. When liberated, they would not leave their prison. Either from grief or want of understanding, these unhappy creatures were insensible to the liberty now offered to them.

After them came a singular personage, one of those men whose malady is the more difficult of cure, from its being 'a fixed idea,' occasioned by excessive pride. He was an old clergyman, who thought himself Christ. His exterior corresponded to the vanity of his belief: his gait was measured and solemn; his smile sweet, yet severe, forbade the least familiarity; everything, even to the arrangement of his hair, which hung down in long curls on each side of his pale, resigned, and expressive countenance, gave him a singular resemblance to the beautiful head of our Saviour. If they tried to perplex him, and said, 'If thou art Him whom thou pretendest: in short, if thou art God, break thy chains and liberate thyself!' He immediately, with pride and dignity, replied, 'In vain shalt thou tempt thy Lord!' The sublimity of human arrogance in derangement!

The life of this man was a complete romance, in which religious enthusiasm played the first part. He had made pilgrimages on foot to Cologne and Rome, and had then embarked for America, where, among the savages, he risked his life in the hope of converting them to the true faith. But all these travels, all these voyages, had the melancholy effect of turning his ruling idea into a monomania. On his return to France, he publicly announced himself as Him whose gospel he had been preaching far and wide. Seized and brought before the archbishop of Paris, he was shut up in the Bicêtre as a lunatic, his hands and feet were loaded with heavy irons, and for twelve years he bore with singular patience this long martyrdom and the incessant sarcasms to which he was exposed.

Argument with such minds is useless; they neither can nor will understand it. Pinel, therefore, never attempted to reason with him; he unchained him in silence, and loudly commanded that every one for the future should imitate his reserve, and never address a single word to this poor lunatic. This line of conduct, which was rigorously observed, produced an effect on this self-conceited man far more powerful than the irons and the dungeon. He felt himself humbled by this isolation, this total abandonment, in the full enjoyment of his liberty. At length, after much hesitation, he began to mix with the other invalids. From that time forward he visibly improved, and in less than a year was sufficiently recovered to acknowledge the folly of his former ideas, and to leave the Bicêtre. *

Fifty lunatics were in this manner released from their chains in the space of a few days. Amongst them were individuals from every rank of life, and from every country. Hence the great amelioration in the treat-

ment of insane patients, which, until then, had been looked on as impracticable, or at least fraught with the utmost danger.

PRENTICE'S TOUR IN THE UNITED STATES.

MR PRENTICE'S small volume, 'A Tour in the United States,' to which we referred in a previous number, presents the unvarnished account of a rapid run, for the sake of health and recreation, in the summer of 1848. The author, who had for some years been connected with the press in Manchester, sailed from Liverpool in the Hibernia steamer, May 13, his friend Mr Brooks accompanying him on the voyage and subsequent journey. A few passages here and there from the 'Tour' may amuse our readers.

On arriving at New York in splendid summer weather, 'with the delightfully cool temperature of only 75 degrees in the shade,' the tourists were struck with the liveliness and beauty of the scene. The spectacle of the noble bay, crowded with ships and steamers, was in the highest degree picturesque and exciting. A lady, 'who had kept the deck in all weathers, said the scene was worth coming across the Atlantic to see, even though the spectator should turn home again without landing.' The beauty of the more retired part of the city was still more unexpected. 'The better class of houses are of white marble, or the light-gray siennite granite. All this, and the absence of smoke, give an exceeding lively air to the whole aspect of the city. We have nothing to match it in that respect in the old country. We have been much struck also with the great number of good dwelling-houses in proportion to the population. There are miles of streets in which there is not a house worth less than 500 dollars, or £100, per annum, and many of them worth three or four times that amount.' The tourists went to the Astor House, a hotel consisting of an immense pile of buildings, enclosing a courtyard like the quadrangle of an Oxford college; the house accommodates 400 inmates, and 150 sat down to table. Dinner most luxurious; strawberries with iced cream for dessert. Ice is an article of great consumption here. 'At table, your tumbler is supplied from a great jug one-fourth filled with lumps of ice; we have found a tumbler of milk with a piece of ice in it a great luxury after breakfast and tea.

'Any one can see at a glance that New York is destined to be one of the largest and wealthiest cities in the world. When evacuated by the British in 1783, it contained about 25,000 inhabitants; the number is now about 500,000. Although always crowded with loitering immigrants, the wages of common labour are about 50 per cent. more than they are in England, and the price of food is one-third less. It is true that rent, clothes, and coals are 50 per cent. higher; but where a man has scarcely earned more than has kept him in food, the change by coming here is decidedly to his advantage, always premising that he brings the kind of labour which is in demand. If the labourer has earned 3s. a day in England, he will earn 4s. 6d. here. Let us compare his relative position in the one country and the other. At home, his food has cost him 12s. a week, and his rent, clothes, and coals, 6s., absorbing all his wages. Let him live in the same style here, and he will pay 8s. for his food, and 9s. for his rent, clothes, and coals, leaving him 10s. a week of clear savings. The misfortune is, that whisky is only 1s. a gallon—very wretched stuff no doubt; not at all the 'real Glenlivet'—but men get drunk upon it for a trifle, and either die, or half-starve, or seek refuge in the almshouse. There is encouragement for sober and industrious men. Irish labourers save a few pounds, enter into some small street-trading, ultimately take a store of one kind or another, and their sons become respectable merchants—a process which we never observe in Manchester.'

Talking of Manchester suggests a comparison between it and New York as to churches. The population

is about the same in both; but while Manchester has 114, New York is provided with 215 places of worship; and 'the various sects live in comparative amity one with another.' We wish as much could be said of any large English or Scotch town. The tourists go from New York to Philadelphia, which has 150 churches, also 'a much larger proportion to the population than we have in Manchester.' The churches in America are furnished and decorated with much taste and a great regard to comfort. The pews are usually of the finer polished woods. From Philadelphia they proceed to Baltimore and Washington; then on towards the valley of the Mississippi, by following the course of the Potomac to the Alleghany ridge. The scenery on the Potomac was rich and pleasing: road across the Alleghanies very bad: jolting in the stage dreadful: all pains compensated by the comforts of a magnificent hotel at Pittsburg: views around the town very fine: take steam down the Ohio to Cincinnati. Prentice grows almost poetical in descending the Belle Rivière, as the French truly named it. 'Constantly winding, every quarter of a mile presents a new form of beauty. At one place we have steep hills on each side, clothed with trees growing as if they never could grow old; at another the ends of ridges, with magnificent monarchs of the forest filling the hollows between them; at another the high banks receding half a mile or a mile on each side, presenting a combination of lawns and trees such as might be expected around an English nobleman's seat; at another islands of surpassing beauty; at another vineyards and orchards; and at every opening clearings which indicate the cultivation that is going on behind. I grudged every moment spent at the breakfast, dinner, or tea-table. I spent hours alone at the highest elevation, where the steersman, perched aloft for a good long look-out, steered the long light steamer through its tortuous course; and after the brief twilight, I felt as one might feel after listening a whole day to the grandest and most beautiful strains of music, sorry that it was over, yet fatigued with the very intensity of pleasure enjoyed. The next day was Sunday, and we enjoyed the same succession of splendid pictures; and I thought of the time when, fresh from the Creator's hand, the earth was seen rejoicing in its loveliness. And then the sunset! It was worth while to cross the great Atlantic for that sight alone. We were in a bend of the river, seemingly completely land-locked. When the sun went down behind the western bank, a deep shade was thrown on the trees on that side, while those on the opposite bank were of a brighter and livelier hue; and then the shadow went upwards from the bottom of the deep slope, and upwards, with a distinctly-marked line, till that bank was also in the shade. And then the bright white clouds—as white as snow—began to change to all manner of bright colours, the orange predominating, in a gorgeousness of which the imitative art could convey no idea; and all this splendour was reflected by the little inland lake—not perfectly, for that would have been a repetition, but reflected from a liquid surface slightly in motion, the colour becoming more golden, till there lay before us "a living sheet of molten gold." Early next morning we found the vessel lying in-shore in a fog so dense, that we could not see ten yards on each side—strange contrast to the scene of the preceding night! . . . The sun soon dispelled the fog, and then the river was before us again in all its glory, widening, and its high banks receding—the white houses, and villages, and small cities increasing in number as we went onwards. In the afternoon of Monday we arrived at Cincinnati.'

From this thriving town the tourists proceed to Louisville, near which is the state prison of Indiana; an establishment worthy of inspection, for it has the merit of being more than self-supporting. 'It contains only 125 prisoners, the whole number of persons under sentence in a population of 800,000! They are set to work in yards and workshops as coopers, joiners, blacksmiths, &c.; and provisions are so cheap, that the sale

of the produce of their labour yields a profit to the State of L.1600 a year, after deducting all the expense of their maintenance, including the salaries of their officers. They are not permitted to converse together while at work, and are locked up in separate cells during the night. Some are working in brick-fields outside the walls, and do not attempt to escape.' To something of this sort our jails must ultimately come: the principle of giving dainty lodgings in palaces is exploded.

The tourists afterwards go by railway up the vale of the Little Miami towards Lake Erie. The country, though very partially reclaimed, was beautiful. In this, the upper part of the state of Ohio, easily to be reached through Canada, there is a favourable field for emigrants with a capital of a few hundred pounds. 'In this beautiful part of the country,' says Mr Prentice, 'I found that land, having the rich alluvial soil all in a state of cultivation, and the woodlands partially cleared, with a good substantial farmhouse, and the necessary farm offices, might be had at from L.7 to L.8 an acre. A well-informed farmer was in the train with us, who said, "If a young man comes on uncleared land, he is completely worn out before he has his work done, and dies when he should be beginning to enjoy himself; but he escapes almost all the hardships if he begins with a good bit of cleared land, and has a house to go into, and a shed to put his cattle into." I asked him what an English farmer could do who should bring L.1000 into such a country. "Do!" he said: "why, he could buy and stock a farm of a hundred acres of capital land, and live like a gentleman." Land partially cleared can frequently be had very cheap. It may sell for ten or twenty times more than it originally cost the clearing purchaser, and would be much cheaper than the forest land at 5s. an acre. The tendency is still westward. A farmer has four or five sons, and he desires that each should have a farm of his own. He sells his 80 acre lot for a sum which will enable him to purchase 500 acres farther west; and there, with 100 acres for each son, he says, "Now, lads, clear away!" He has been the pioneer into the forest west of the Ohio, and is quite ready to become the pioneer west of the Wabash. His sons will have the same migratory spirit. As their sons grow up, each father will sell his 100 acres, that he may purchase 500 west of the Illinois or the northern branch of the Mississippi. Thus can the English farmers always find small lots, purchasable at a rate cheap in comparison with the cost of clearing land, with a dwelling-house and cattle-sheds all ready; and thus he may avoid the fever and ague, which are almost certain to attack the northern Europeans who venture to break ground in the dank forest or swampy prairie.' Capitalists, he adds, may here lend money on good mortgages at 8 per cent. interest, payable half yearly. 'We have hundreds of tradesmen in our towns who cannot continue in business without the fear of losing all, and who have not accumulated sufficient money to retire upon. A man of such a class in England cannot live upon the interest of L.1000; but here, for L.200 he could purchase and stock a little farm of twenty-five acres, which would enable him to keep a horse and cow, sheep, pigs, and poultry, and supply his family with every article of food, while his L.800 at interest would give him an income of L.64 a year. He could even have his own sugar from his own maple-trees to sweeten his cup and preserve the peaches from his own fruit-trees; and almost all he would need to buy, besides clothes, would be tea, which may be had, of good quality, at from 1s. 9d. to 2s. a pound. Still farther west he could have 10 per cent. interest for his money.'

Sandusky is the point of embarkation on Lake Erie, and the tourists steamed thence to Buffalo. A view of some of the finer parts of Canada leads to the reflection that a settler in that country may be as successful as in the United States, 'as far as individual exertions go; but the man in the States profits not only by his own activity, but by the activity of all around him. His farm is not only improved by his own labour and skill,

but it is increased in value by the rapidly-increasing populousness of the district in which it is placed.' So says every traveller. Canada is retarded in every effort at advance by the perplexing regulations of the colonial office, as well as traditional usages; and on that account alone, even with a prejudice in favour of British institutions and manners, we should, if emigrating, decidedly prefer the United States.

The tourists visit Toronto, see Niagara, and thence go on to Montreal by water. The descent is somewhat hazardous. 'At Kingston we left the lake-boat, and went on board an iron steamer, admirably constructed for the rather hazardous navigation of the rapids on the St Lawrence. We were soon amongst the "Thousand Islands;" and here, as at most places much praised, I was somewhat disappointed. The islands were flat, and the wood was stunted and thin. The scenery was little better than we see in England when a river has overflowed its banks, leaving only the hedgerows and little hillocks visible above the water. But the islands became larger, rose more abruptly from the river, and increased in magnitude, till, instead of a wide lake studded with islands, we had an endless succession of canals cut in the solid rock—now straight, now curved; now wide, now narrow; now running in a strong torrent, now placid as the surface of a mirror. It was not until very recently that the steamboats went through from Kingston to Montreal, the navigation of the rapids being considered too hazardous; and the passengers were thrice landed, and thrice had to proceed portions of the way by stage-coaches. Now the vessels go right through; for although the mighty stream flows with extreme rapidity, there is a great depth of water, and little real danger if the steersmen do their arduous duties faithfully. The passage down one of these rapids is rather an exciting scene. Although the rocks are far down in the depth of the river, the surface is agitated like the face of the sea in a brisk gale. Through the high waves the ship dashes bravely. The danger is only from careless steering; but one feels that the slightest blunder would dash the ship to pieces on the rocks that line the rapids on each side. There is life and excitement in the scene; and we, who had been much urged to take a voyage on the sluggish and muddy Mississippi, rejoiced that we had chosen rather to intrust ourselves on this magnificent and impetuous outlet to the great inland fresh-water seas. At Lachine our noble steamer stopped all night, the rapids between that place and Montreal being too hazardous to be passed except in broad daylight. Many of our passengers took the railway thence to the city, a fine steamer having been lost in the strongest of the currents only a few days before, in consequence of coming upon an unperceived raft of wood, and the passengers rescued with difficulty. We thought there might be safety in the additional vigilance that would be exercised after an accident, and we were rewarded by the sight of a beautiful and highly-exciting scene. While carried downwards at an alarming velocity—rocks rising up at each side, in the middle, now here, now there, often as if we were inevitably upon them, till a sudden twitch of the wheel changed our course—we enjoyed a sight not to be forgotten. There were six men at the wheel on the forepart of the deck, and their muscular strength was constantly in full requisition. I know not which was finest, the look downwards to the raging stream, or upwards to the eagle glances of the Indian pilot and his assistants, whose looks betokened their deep sense of the great responsibility they had undertaken. When we were safely through the greatest *chute*, we again breathed freely.'

Mr Prentice returns from Canada to the States by way of Saratoga, a northern watering-place, resorted to by the wealthy from all parts of the Union. The water, which is gaseous, and 'tastes pleasantly sharp, like the soda-water of our shops,' has a wonderful effect on the languid visitors from the south. After a few days' use of the water, they improve surprisingly in health. 'The

eye begins to recover its brilliancy, then the yellow tinge gradually leaves the complexion; in the course of a fortnight or three weeks, activity and cheerfulness are restored, and then the patients are able to take a tour to Champlain, Montreal, Quebec, Niagara, and the great lakes, before their return to the relaxing heats of the south. This tour becomes an annual necessity, and with many of the planters an annual luxury. We were told of one gentleman who, bringing his family with him, spends L3000 sterling every season in pursuit of health in the country, and amusement in the great towns; and of two others who each spend L2000 in their northern trip.'

On the 6th of August the tourists arrived in the Mersey by the Niagara steamer, which kept its time to a minute. From the time of leaving Boston, ten days and a-half had elapsed; and deducting twelve hours spent at Halifax, exactly ten days were occupied in crossing the Atlantic—distance 2950 miles. 'In 1818,' says Mr Prentice in conclusion, 'I was the same time in making the voyage from Glasgow to Liverpool.'

THE PET LIZARD.

It is a saying as old as Sterne that 'the heart must have something to love.' Go into a convent, you will perhaps see the solitary nun cherishing a pair of canaries, and watching their domestic labours of feeding and rearing their young. It has been said of state prisoners shut up in the most horrible dungeons—such as, thanks to the progress of civilisation, are now never used, but only *shown* as relics of barbarity—that they have beguiled their heavy hours by taming and feeding those most noxious of vermin, rats and mice. I have read of a missionary at the Cape of Good Hope who had a puff-adder in his room as a pet and rat-catcher. They tell also of a gentleman who watched day after day in his solitude a spider, which had won his heart by showing so great a predilection for his sweet music, as always to descend by a long silken shining thread, and remaining so suspended above the piano until its sounds ceased. For my own part, I had a much-valued and dearly-beloved relative who once petted a lizard. Of this friend and his lizard I wish chiefly to speak; not only to illustrate further the fact, that 'the heart must have something to love,' but also to let those who may read these lines become acquainted with this harmless and interesting companion of man in the East. There is not a house or a wall which has not its *Tic-tic-kie*, so called from the chucking sound they emit, or *Cheep Khellie*—literally, hide-and-seek player; and these no one thinks of disturbing or molesting.

The friend above alluded to had met with a severe bereavement; and from being a cheerful, social man, he became gloomy and retired, chiefly occupied in his library. One day, as he was rummaging amongst his books, and making some new arrangements, he, fortunately for himself, fell in with two little beautifully-smooth round eggs. No bird could enter *there*, nor was there a nest to be seen. They could not be snake's eggs, for they were not larger than a white dry pea; so what unknown creature could have deposited them on the boards of the book-shelf behind the Bible?

An old venerable *khansamah*, or steward, who was referred to, immediately pronounced them to be lizard's eggs; and when this was known, they were carefully deposited in dry sand, and a watchful eye was kept over them, keeping the glass covered with a perforated paper. One of the eggs was unproductive, but from the other there came forth a little slim, brown, active creature, which was shifted into a clean abode, and daily fed with flies and small insects, until it grew as large as a man's finger; and Mr K—, knowing how tame it was, and how attached the *Tic-tic-kie* is to his old haunts, at last allowed his founding to leave his prison.

As good-luck would have it, he was let loose upon the toilet-table, and always remained behind the glass, creeping out and in into one of the empty drawers, and

literally playing bo-peep when an insect was offered by the kind hand which nursed him. When the wall-shades were lit at night, each containing a tumbler made for the purpose, half-filled with water, and the rest pure oil of the cocoa-nut floating on the top, in which blazed a wick of white cotton, the lizard would leap upon the wall, and the bright round circle of light thrown by the mouth of the shade was its favourite resting-place. Its little prominent jet-black eyes were indeed two sparklers; and wo to the moth or insect which ventured into the magic circle, or came under the fascination of those eyes! The agile lizard immediately became as if transfixed; then, by imperceptibly gradual paces and evolutions of its body, it advanced until the last deadly jump was given, and then its victim was firmly held between two toothless, but never-relaxing little jaws. And so the hunt went on, to Mr K——'s great delight; the game being most abundant on a damp night, when the flying white ants, grasshoppers, and moths swarm, particularly in the sultry weather of August and September.

So months and days flew by, and the rational and irrational friends lived on in undisturbed harmony, until, as Mr K—— was gazing with uplifted eyes on the wall one night, a light-coloured, almost white lizard made its appearance! He having studied only his own pet, knew little of the genus besides, so he could not account for the change his lizard seemed to have undergone; but in a little he was undeceived, for out crept his own pet also, first gazing cautiously, then appearing ruffled, and at last angry at the intruder. They exchanged fierce glances, wagged their tails, and defied each other, till at last the deadly leap was given, with a slight *creek-creek*, and oh, horror! Mr K——'s protégé had his tail bitten off; and he had the agony of seeing it wriggling and trembling in the mouth of its assailant! The brown lizard fell stunned to the ground, and lay almost lifeless at Mr K——'s feet; and his white enemy, having been frightened by the commotion in the room, dropped the little worthless tail, and took himself off, and was never again seen within the limits of the library.

Mr K——'s pet, however, came soon to himself, and kept as usual to his wall, glass, and drawer; and was watched, if possible, with more than the usual interest. In a few days, to Mr K——'s surprise and satisfaction, the mutilated tail was seen to grow: it waxed bigger and bigger daily, and, what was more strange, a little deformed side-tail was seen sprouting at the root of the old stump. Jackey's tails were shown to all Mr K——'s wondering and sympathising visitors, who, like many others, had never troubled their heads about such trifles, until the old khansamah enlightened them anew, by stating 'that Tic-tic-kies were of various shades; that the males, when they intruded upon each other's sporting-ground, or met in their courting season, generally fought and attacked each other; and that in these battles the tail was frequently seized and bitten off, and as frequently grew again, as the claws and feet of spiders and lobsters do; and that he, the khansamah, had now and then, but *not often*, seen a lizard with a double tail.'

I may as well observe, before this is concluded, that the subject of our discussion has a very curiously-made foot, as the impressions which it occasionally leaves on the damp panes of window-glasses show. The foot, with four little toes, has the power of making a vacuum, and has the appearance of a file, or the sucker of the Remora fish; so it is enabled to hold on, even when it walks over a steep wall, polished glass, or with its head downwards, like the flies crawling over the ceiling of a room. The body or feet of a lizard would seem to emit something corrosive or irritating; for when it happens, as is sometimes the case, to run over the face of a person asleep, the skin is found in the morning to be blistered or excoriated. The tail of the lizard has a ring-streaked appearance, and, as has already been related, grows readily when by accident broken off.

Rearing and tending the Tic-tic-kie proved certainly to Mr K—— what searching and looking for the fern blossom would be to a melancholic mind—a *répê* for the blue devils. It beguiled many sad hours, and cheered a drooping heart.

EARLY PRINTING IN CHINA.

ACCORDING to a German antiquary, the idea of printing from types was suggested to the mind of Faust by his seeing the footprints of a horse in the soft mud of a road by the side of which he was walking. He went home cogitating on the circumstance, and from that day printing was discovered.

Whatever value may attach to this tradition, much of it would disappear in the fact, that it does not record a first discovery. The East, which has proved to be the birthplace of so many of our arts, also originated printing. Klaproth states, in his 'History of the Mariner's Compass,' that the first use of stereotype, or solid wooden blocks in printing, dates from the tenth century of the present era. 'Under the reign,' he writes, 'of Mingsong, in the second of the years Tchang-hing (932), the ministers Fong-tao and Li-yu proposed to the Academy Koue-tseu-kien to review the nine king, or canonical books, and to have them engraved upon blocks of wood, that they might be printed and sold. The emperor adopted the advice; but it was only in the second of the years Kouang-chun (952) that the engraving of the blocks was completed. They were then distributed and circulated in all the cantons of the empire.'

This author further observes that the art thus practised in China might have been known in Europe 150 years prior to its discovery by the Germans, if Europeans had been able to read and translate the Persian historians, as the Chinese method of printing is clearly explained in the *Djemma'a-et-tewarikh* by Rachid-Eddin, who finished this immense work about the year 1310.

It has, however, been shown, in a communication made to the French Academy, that the art of printing was known to the Chinese at a period still more remote; and had Europeans been at that time in correspondence with the Celestial Empire, we should not now have to deplore the loss of manuscript books by early classic authors; their multiplication by printing would have secured the survival of at least a few. However imperfect the process might have been in its origin (before the 6th century), the master-works of Greek and Roman literature—some of which are now irreparably lost—might have been reproduced at comparatively small cost. That the antiquity rests upon good ground, appears from the 39th volume of the 'Chinese Encyclopædia.' We there read—'The eighth day of the twelfth month of the thirteenth year of the reign of Wen-ti, founder of the Soui dynasty (593), it was ordered by a decree to collect the worn-out drawings and inedited texts, and to engrave them on wood, and publish them. This was,' continues the work quoted, 'the commencement of printing upon wooden blocks.' This fact is confirmed by other Chinese writings; and the art, we are informed, grew much into use under Thang, 618 to 907; made still greater progress during the five lesser dynasties, 907 to 960; and reached its perfection and greatest development in 960-1278. It is considered probable that the art was known even before 593, as the block-printing was then ordered by the emperor: had it been altogether a new invention, something would have been said about its origin and author.

About the year 175 the Chinese began to cut inscriptions on stone, to preserve the purity of certain texts which had been corrupted by the errors of copyists. The six canonical books were inscribed in this way on slabs; the literary scribe wrote the characters in red, which were afterwards cut in by skilful artists. These slabs were placed outside the college gates, so that the learned might compare and correct their manuscript copies of the six books. These tablets were copied and

recopied as they decayed by age, and sometimes in three different sets of characters, to each of which students were allowed one year's study, and at the end of three years, were expected to read them all fluently. About 904, engraving on stone in the inverse sense was introduced, so as to print white on a black ground.

In 993 the Emperor Thai-tsong issued a decree, ordering that all the manuscripts recovered from those persons into whose hands they had fallen after being stolen from the royal tombs, should be engraved and reproduced in printing. These, we are told, were printed by hand, without being soiled by ink.

Between 1041 and 1048 the method of printing by movable types was introduced. The account is interesting:—'In the period King-li, one of the people, a blacksmith named Pi-ching, invented another manner of printing with *ho-pan*, or tablets formed of movable types.' The name is still retained in the imperial printing-offices at Peking. The ingenious blacksmith's method is thus described:—'He took of a fine and glutinous earth, which he formed into plates, and engraved on them the characters most in use. Each character was a type. These he burnt in the fire, to harden them, and then placed them upon a table of sheet-iron, coated with a fusible gum composed of resin, wax, and lime. When he wished to print, he took a frame of iron, divided interiorly and perpendicularly by strips of the same metal (Chinese is read vertically); and having laid it on the sheet coated with gum, inserted the types, placing them one close against the other. Each frame, when filled, formed a tablet. This was brought near the fire, to make the gum melt, after which a level piece of wood was pressed forcibly on the surface of the types, and pushed them down into the gum, by which means they became firm and even as a stone.'

There is so much in this account that would answer for a description of the present mode of printing, as further to exemplify the perfect state in which the art originated. Compared with others, there was but little feeling of the way in reducing it to practice; an important fact, when we consider the object—transmission of thought. Pi-ching's method, we learn, was very expeditious when a large number of impressions was required. On such occasions two forms were worked, one being inked while the impression was taken from the other. It is the custom in China to print but two pages at once, and on one side of the paper only; the sheets are then folded for binding, and the blank sides either left open or pasted together. Duplicates of many of the characters were kept wrapped in paper, and twenty of those most in request. When a new character was wanted, it was immediately prepared on the spot, and the inventor showed the advantage of clay over wood; there was neither grain nor porosity, with a greater facility of separation from the gum when required for distribution.

At Pi-ching's death, all this apparatus was carefully preserved by his successors; printing, however, went on in the old way, the reason being, that the Chinese has not, as other languages, an alphabet made up of a few characters with which all sorts of books may be printed, but a separate type is wanted for every word; and as the language is divided into classes of 106 sounds, so 106 cases (part of the furniture of a printing-office) would be required, each one to contain a prodigious number of types, thus rendering the mechanical task of composing and distributing one of enormous difficulty and labour. It was easier and cheaper to follow the usual method. This was, to write the text on a sheet of paper, which, being pasted on a wooden tablet, all the blank spaces were cut away, and the writing left in relief. In this way printing in China was carried on for a number of years, either by blocks of wood, or plates of stereotyped copper.

In 1662 the Emperor Khang-hi, on the representations of European missionaries, ordered that 250,000 movable types should be cut in copper. With these the Kou-kin-thou-chou, a collection of ancient and

modern works, was printed in 8000 octavo volumes, of which a considerable number have found their way to Europe, and are deposited in the Royal Library at Paris. This work is a beautiful specimen of Chinese typography: it comprises treatises on music, a history of the language and of foreign nations known to the Celestials. Some of the works issued from the imperial press at Peking are so fine and beautiful, that the emperor named them Tsiu-tchin, or collected pearls. An interesting fact occurs with regard to the casting of types. In Europe, the steel punches and copper matrices required for the purpose involve a considerable outlay, and are liable to deteriorate by rust. The Chinese obviate this double inconvenience by making the punches of a very hard fine-grained wood, at a cost, for each type, from one farthing to a halfpenny. With these the matrices are struck in porcelain clay, baked in an oven, in which the type metal is melted. Judging from the specimens of printing, there is no more difficulty in 'justifying' the matrices thus produced than those of other material.

In 1773 the enlightened Emperor Khien-long decreed that 10,412 of the most important Chinese works should be engraved on wood, for printing in the usual way. Kin-kien, a member of the finance ministry, drew up a report, illustrated by plans and models, setting forth the expense of so large a quantity of wood-engraving, and recommending movable types. The minister's advice was followed; and from that day printing with movable types has made steady progress in China, and superseded the old method of block-printing. It was formerly the custom to defer all the corrections until after the printing; this also has been broken through, and the printers of the 'central flowery land' now adopt the more sensible European method of correcting before going to press.

Remote as is the antiquity thus assigned to printing, a French writer, Monsieur Paravey, shows it to be still more ancient. According to his statements, the Chinese only did on paper what had been done ages before on cotton by the Assyrians and Indo-Persians.

THE EXPELLED LACEWORKERS OF CALAIS.

It will be remembered that at the outbreak of the Revolution in France, February 1848, a large number of English operatives at Calais, Rouen, and other places were expelled from the country under circumstances of great injustice and indignity. At Calais, where about a thousand persons, chiefly from Nottingham, had been for some years settled in connection with the lace trade, the cry of *à bas les Anglais* was particularly violent, and personal injury was only averted by the timely interference of the English consul. Unwilling to return to England, where their profession was overcrowded, the unfortunate laceworkers sent a memorial to Lord Palmerston, desiring to obtain passages to one of the English colonies, and preferring, if a choice were permitted, to go to South Australia. In three days an answer was returned by his lordship, and a government commissioner arrived to make the requisite inquiries. He was immediately succeeded by Mr Cooper, a gentleman from the office of her Majesty's Land and Emigration Commissioners, who instituted diligent scrutiny into the characters and circumstances of the memorialists, and then arranged for their passage to England, preparatory to emigration for these colonies. On their arrival in London, they learned that a benevolent committee was sitting daily at the Mansion-House, under the auspices of Lord Ashley, and engaged in getting up a generous subscription, to which the town of Nottingham contributed from L.300 to L.400 for the relief of those who were hourly compelled to return to England from the French territory. The objections of the commissioners to send lacemakers and their families to a young colony like South Australia were compromised by an allowance of L.5 per head from the subscription fund, and an engagement to provide a good outfit. The details were then arranged, and the 'Harpley' being appointed, a detachment of the emigrants embarked, and soon the poop of the ship, to use our informant's words, was 'transformed into a haberdasher's shop,' from which everything necessary was

gratuitously and unsparingly supplied to those who were in need; Mr Cooper being charged with Lord Ashley's princely commands to let the unfortunate want for nothing. Mr Commissioner Wood visited them at Gravesend previous to their departure, and addressed to them an admirable speech, full of kindness and encouragement, assuring them they were proceeding to a land where honesty and industry seldom failed to find their proper reward.

We notice all this for the purpose of mentioning that intelligence has been received in England of the safe arrival of the Harpley with the detachment of emigrants on board. The vessel came to an anchorage at Adelaide on the 30th of August, having occupied the interval from the 12th of May on the voyage. Referring to the arrival of the Harpley, the South Australian 'Register' of September 6 observes:—'The only instance of death among the adults in the course of the voyage was an aged and ailing man (in his sixty-seventh year), who was unwilling to be separated from his family, and to whom the commissioner humanely granted a free passage. He died in traversing the Bay of Biscay; the only instance of mortality besides being a delicate infant of three months old. During the passage the ship only sighted the Cape Verd Islands and St Paul's. The passengers, who were scarcely becalmed on the Line, suffered little from heat in the tropics, and as little from cold in the southern hemisphere, 39½ degrees south being the most southerly latitude the vessel attained. There was no case of serious illness during the greater part of the passage, and 256 souls have arrived in excellent health, in a remarkably clean and well-commanded ship, manned by a fine crew. During the passage Mr Spencer, the surgeon-superintendent, read prayers every Sabbath, when the weather permitted. We have seen in the hands of the refugee emigrants some of the certificates granted by employers and municipal officers in France, and they speak well for the character of the people, who, we hope, will find they have exchanged the inhospitable treatment of the French for a hearty welcome in a British colony. There is an instance calling for especial sympathy and spirited exertion on behalf of the colonists, and we shall much mistake if the newly-arrived do not in their case confirm the assurance, that any honest men and women who venture to South Australia with their offspring will be likely to find the right hand of fellowship extended towards them in a land of plenty.' Other detachments of the Anglo-French laceworkers have, we believe, gone to Port Philip and Sydney.

DUBLIN AND KINGSTOWN RAILWAY.

It is a fact worthy of consideration, that the only railway in Ireland which is fully remunerating the proprietors is the line from Dublin to Kingstown, six miles in length, which was made in the midst of ignorance as to the now existing light of railway engineering, and which actually cost over a quarter of a million of money, or at least double the rate per mile for which it could be now completed. And how was this? Simply that this line was an accommodation to the inhabitants of Dublin—first, for pleasure, and ultimately for daily intercourse; and that this accommodation was given at a tolerably moderate rate of charge, and with a wondrous saving of time. We have before us some strange records and statistics concerning this railway. From the first, we find that Mr James Pim and his colleagues were set down as a set of mad, jobbing Quakers, for thinking of such a scheme, and that a certain lord mayor of the city actually protested against the undertaking, on the grounds that her Majesty's loyal subjects would be in danger of losing their lives, or at least their sight, 'from the starting of horses on the Rock Road, and the red-hot dust that would issue from the engine.' And we ourselves knew more than one respectable old gentleman who prided himself to his death on the fact that he never travelled by the 'vile railway.' These are some of our records. From our statistics, we find great facts of the advantages to the public. The houses along the line have actually increased one hundredfold; the number of passengers carried yearly have more than doubled from the commencement; and in 1847 a dividend of 9 per cent. per annum was made at the half-yearly meeting. In order clearly to understand what the increasing traffic on this little line is, we may state that, in 1840, 1,280,761 passengers were carried; in 1847, 2,303,910; showing an increase of 1,023,149.—*The Advocate, an Irish newspaper.*

EVENING SOLACE.

[From 'Poems by Currer Bell,' lately published.]

THE human heart has hidden treasures,
In secret kept, in silence sealed;
The thoughts, the hopes, the dreams, the pleasures,
Whose charms were broken if revealed.
And days may pass in gay confusion,
And nights in rosy riot fly,
While, lost in Fame's or Wealth's illusion,
The memory of the Past may die.

But there are hours of lonely musing,
Such as in evening silence come,
When, soft as birds their pinions closing,
The heart's best feelings gather home.
Then in our souls there seems to languish
A tender grief that is not wo;
And thoughts that once wrung groans of anguish,
Now cause but some mild tears to flow.

And feelings, once as strong as passions,
Float softly back—a faded dream;
Our own sharp griefs and wild sensations,
The tale of others' sufferings seem.
Oh! when the heart is freshly bleeding,
How longs it for the time to be,
When, through the mist of years receding,
Its woes but live in reverie!

And it can dwell on moonlight glimmer,
On evening shade and loneliness;
And, while the sky grows dim and dimmer,
Feel no untold and strange distress—
Only a deeper impulse given
By lonely hour and darkened room,
To solemn thoughts that soar to Heaven,
Seeking a life and world to come.

JOHN HOME, AUTHOR OF 'DOUGLAS,' IN THE '45.

John Home, with many others, took up arms to oppose Prince Charles and his Highlanders. A band of volunteers, consisting of students and others, inhabitants of Edinburgh, was quickly raised, and in this corps he was chosen lieutenant. In that capacity he waited on General Hawley, who commanded the cavalry, requesting permission for the volunteers to march with the king's troops to Falkirk, where the rebel army lay, which the general readily granted. This is mentioned by himself in his 'History of the Rebellion.' But it was not collegians and burghers of Edinburgh city, nor even the king's troops, that were able to stand against the fury of the bold Highlanders. Prince Charles swept everything before him, and at the battle of Falkirk the royalist army, with the volunteers, was completely routed. General Hawley fled from the field, and with his scattered force betook himself to the old palace of Linlithgow, from which, it is said, he was driven in scorn by the spirited matron, the keeper of the palace, who to his face upbraided him with running away. John Home was supposed to have fallen in the battle. He was taken prisoner by the Highlanders, and, along with Barrow and Bartlet, his fellow-collegians, was sent captive to the castle of Doune, in Perthshire, from which they contrived to make their escape in the following manner:—During the night, when the prisoners were not very rigidly watched, they tied their bedclothes together, and by the precarious line thus formed, descended one after another from the window of the prison. Barrow, his favourite companion, was the last to commit himself to the rope, which gave way with him, and he was precipitated to the earth, and very seriously injured. John Home, stout and able, took Barrow on his back, as did each of his companions by turns, until they reached a place of safety.—*New Monthly.*

PUNCTUATION.

Cæsar entered on his head, his helmet on his feet, armed sandals upon his brow, there was a cloud in his right hand, his faithful sword in his eye, an angry glare saying nothing, he sat down.

CONVERSATION, NOT DISCOURSE.

A FRENCHMAN remarked of a gentleman in company, in whom he could not discover any other quality susceptible of a compliment, that he had 'a great talent for silence.' This, under an equivocal appearance, is a compliment, for to possess the self-control required for the holding of one's tongue is no unimportant gift. It is well to be able to talk; but it is also well to be able to listen. Without this there can be no conversation; there only can be discourse, which in company must ever be a bore.

Some persons do occasionally allow others to speak, without those other people deriving much benefit from the concession. It is the fault of many of my friends, nay, I know whole families affected by the peculiarity, only to pause while another speaks, and then to go on with their own stream of ideas, saying nothing apropos to what they have heard but 'yes' or 'indeed,' pronounced probably in a way which implies that they have not taken in a single idea from what was said. It is only an advanced stage of the disease, when no pause is allowed except on the merest compulsion, and nothing is heard in the circle of company but one ceaseless rattle of the hailstorm of loquacity from one person. Such discourse is sometimes not bad in itself; but this is nothing to the purpose. Though it be replete with intelligence and cleverness, it is not the less a pest if it precludes others from uttering their sentiments—if, in short, it prevents conversation. In general, however, loquacity is not attended by either brilliancy or any more solid quality. It is almost invariably full of repetition—repetition of words, repetition of sentences, repetition of ideas—one principle ruling with the discourser, that he must be saying something in order to keep 'possession of the house.' We are usually condemned, in the company of such a person, not merely to keep our own good things to ourselves, and to lose all the benefits of the excitement derivable from conversation, but to hear things said ill, and at great length, which we could have said twenty times better ourselves, if we had thought them worth saying at all.

There is a point of view in which 'discoursing' may be regarded, somewhat different from that in which we usually see it regarded, and of no less importance. This is as respects the moral destiny of the discourser himself. He shuts himself out from learning anything in the society of his fellow-creatures. He goes from Dan to Beersheba, and *makes* all barren. A friend and contributor has stated this so clearly and practically, that we give it as a good illustration, both of the tyranny of the talker and the sufferings of the talkee.

'Having, from position and the direction of my studies,' says he, 'acquired a sort of character as a

cicerone in my native city, I am frequently honoured by the introduction of strangers to my attentions and good offices. I always do gladly what I can for their gratification, seldom failing to invite them to my house, besides conducting them to whatever public objects are worth seeing. It may sound oddly, but it is a fact, that only a small portion of these strangers allow themselves to be instructed or informed by anything I have to tell them. It is what I might almost describe as the general case, that my new acquaintance is far more eager to tell me what he knows of other places and things, than to listen to what I have to tell him of the places and things now under his actual attention. He may have started at the beginning with a declaration of his satisfaction in being introduced to one possessed of so much of the local intelligence which is useful to a stranger; but it is all the same. He begins to talk—he continues to talk—he ends talking. I may have, at the most, been able to arrest him for a minute before a particular object, while I recounted what I knew about it, or pointed out its most notable beauties. But even during such intervals, it was evident that he bridled in his struggling muse with pain, and waited with impatience till he could with decency cut me short, in order that he might launch once more into his own nobler strain—possibly a detail or discussion of something ten thousand miles away from the object of his visit, and which might have been quite as well detailed or discussed at any other time. Is not this a strange anomaly in human conduct? Yet I assure you it is what I am continually meeting with. Certainly one out of every three men and women who professedly come to get the benefit of my *ciceroneship*, goes away without properly hearing one word I have to say; and all from being so much more disposed to be speakers than listeners. What is very provoking, I sometimes hear of such persons telling the introducing friend afterwards that they did not wonder at my having such a repute in my particular walk; they had found my conversation so instructive; as if they had done nothing but listen to me all the time we were together.

'Some time ago I had a lady sent to me with a strong recommendation, and I lost no time in bringing her before some of the best company I could command. Our party was small, but it comprehended two or three extremely clever agreeable persons—persons, too, who were "lions" in their own way. What was the result? The stranger began with a string of commonplace talk before she had sat down. Ere three minutes had elapsed, I exchanged a look with my wife, implying our common sense of the genus she belonged to. Our prophetic souls were justified. There was no end to the lady's chat. If I contrived, now and then, to get a remark thrown in, she waited till it was done, and then went on without reference to it, as if it had made no impres-

sion upon her mind. My clever friends were kept in silence the whole evening. At last our visitor departed in the highest spirits, as if she had accomplished some great mission. And so she had. She had succeeded in keeping up a talk for three hours, to her own infinite satisfaction. I only felt how great a drawback it was from her triumph that she had failed entirely to benefit by her accidental rencontre with two or three of the most intelligent and reflecting persons of our age—men with whom she might never meet again. In exchange for this, and for the local information of an interesting kind which was at her command, and which might have been of considerable use to her during the remainder of her stay in our city, she had obtained—what?—only the pleasure of hearing her own tongue rain off insipid chat about nothings and nobodies for three hours together.

'I write this in sober earnest, as an account of facts which fell under my observation. Be it for you to philosophise the subject. I would only add, that this uncontrollable spirit of talk strikes me as one of the greatest misfortunes that can befall a human being, seeing that it almost precludes all receipt of instruction. Such a mind may see new things, but it can get none by hearing. One great channel of intelligence is shut up. Such a person, I conceive, might go over the world, and come back nearly as ignorant as at the outset; while a much duller person, who could listen, would return laden with a prodigious stock of information.'

To this we can add an amusing experience of our own, the hero of which is a literary man of some note. We were both at a party in London a few years ago, where General Miller, who had recently returned with many laurels from South America, was the principal lion present. My friend came up against me in the crowded drawing-room.

'Do not stop me,' said he, glaring anxiously around: 'I must see him: I have been promised an introduction, and I feel the interview to be a necessity.'

'Whom do you mean?' we inquired.

'Why, Miller—that prodigious fellow, who can tell a South American bullet by the feel! It is worth a thousand pounds to me to know such a man: don't stop me;' and catching a glimpse of the general talking with our hostess, who had promised to introduce him, he bore gallantly up through the crowd. Being curious to witness the introduction, we followed at his heels. The cabalistic words were pronounced, the bows exchanged, and our friend drew himself up.

'General Miller,' said he, 'I am overjoyed to make your acquaintance. I consider this, in fact, a remarkable moment in my life, and a moment from which henceforward I—hem—shall date my proudest thoughts!'

'Upon my word, sir, you are very'—

'Not at all. That land which was the field of your exploits has haunted me like a passion; and an introduction to one so thoroughly conversant with her arcana, and whose history is so inextricably interwoven with her fate, must unquestionably be a matter of the very highest interest to me. You must often have meditated on the chance which robbed Portugal of the honour of discovering America'—

'Sir, I do not'—

'Frankly, I stand corrected. I was wrong to say "chance;" for it was really the perfidy of John II., as you were about to observe, which drove the Genoese pilot into the arms of Spain. Think of three large crazy boats—for you know they could not be called ships—for such an expedition, and a cost of not more than £4000! Think of the position of the gallant Colon, when his despairing crew broke at length into open mutiny! Well, sir, the fragment of a tree with red berries, floating on that desert ocean, was like the olive branch brought by the dove into the ark; and then came that ever memorable tenth of October'—

'But, sir'—

'Old style—I was going to say old style (thank you)—when the new world was for the first time trod by European foot. Columbus fancied that he was among the Indian isles, and that China and Japan were not far off: hence the name of West Indies still retained by his first discoveries. Amerigo Vespucci came later into the field (with Ojeda's expedition, you know), and gave his own name to the entire continent! Think of that! The reason was, that Amerigo was not a mere commander: he was an author—he wrote a book. Eh, general? He! he! he!'

'Sir, I must really'—

'Oh, I was only in jest. It was undoubtedly a usurpation of the right of Columbus. Well, sir, the Portuguese now followed in the track of the Spaniards, and discovered Brazil; then came the abandonment of Columbus by the capricious tyrants whose reign his genius had rendered illustrious: he was carried in chains to Spain, and afterwards permitted, as a favour conferred upon his old age, to endeavour to find a passage to India by the way of America, and, while looking for a strait into the Pacific, to discover an important part of the mainland. Now'—

'But really, sir, all this'—

'Is introductory (thank you)—merely introductory. The colony planted originally by Columbus in Hispaniola made the natives virtually slaves, and then thinned their numbers with fire and sword to such purpose, that in fifteen years the population had decreased from a million to 60,000. This was partly made up, however—for the mines could not be worked for want of labourers—by the importation from the continent of 40,000 new slaves. And now we come to the conquest of New Spain by Cortes, and that of Peru by Pizarro in'—

'Good sir'—

'I know all that. These Mexicans and Peruvians were really civilised nations, whereas the other Americans were in a state of innocent savagism. Cortes, notwithstanding, marched his handful of Spaniards to the capital of a vast and populous country, took possession of the person of the Emperor Montezuma, loaded him with chains, and burned his son and the chief officers of his army alive. His atrocities at length roused the indignation sufficiently to overpower the cowardice of the natives; and surrounding his little force, they compelled him, with much slaughter, to retreat. On obtaining reinforcements, however, he returned, captured the city of Mexico, and with it subdued the liberties of the entire country. The success of Pizarro at Caxamalca was equally wonderful. He got hold of the Inca; held him to ransom for a roomful of gold, and this being duly paid, put him to death, and rendered all Peru a Spanish province. When this was done'—

'Once for all, sir, I beg you to excuse me!'

'And with good cause. The modern history of South America is your own, and it would come more gracefully from your lips. But it now waxes late, and I must be satisfied for the present with this delightful and profitable conversation. Believe me, I shall not readily forget so rich a treat, so valuable an intercommunion!' Our friend bowed respectfully; and General Miller, shaking him by the hand with great alacrity, dived in an instant to the farther end of the room.

'Well,' said we, 'how do you like him?'

'He is a prodigious fellow! I would not have missed this for a thousand pounds!' For months after, he expatiated upon the honour and advantage he had enjoyed, and we were told that he proposed to the booksellers a 'Continuation of Robertson's History of America,' on the strength of his intercommunion with the patriot-general.

We remember another interview of a less gratifying nature, in which the interlocutors, who had been especially introduced, were both talkers. When this is the case, it is no amicable ride-and-tie affair, but a headlong race, in which the runners grapple as they fly. On the occasion referred to, it was curious to observe how

closely the opinions they formed of each other coincided. 'He is a sensible man,' said one; 'he talks well, nobody better; but, hang it, he talks too much! I could not get in a word edgewise the whole time.' The other, on being asked how he liked his new friend, replied candidly that he liked him much—very much indeed. 'But he has one fault,' added he: 'so absorbing a passion for hearing his own voice, that he will listen to nobody else. I do not think, moderately speaking, I was able to utter a dozen words from first to last!'

These are examples of 'discourers,' 'outpourers,' 'monopolisers,' call them what you will. Living solacisms they are in themselves, wretched nuisances to others. Our correspondent calls on us to philosophise on the subject. We are not disposed to do so; but we may remark that the foundation of the evil appears to us to be a kind of intemperance. The fault is found very frequently in literary men of intense activity of brain, and whose writings are rather effusions of telling words than of solid ideas. They engross conversation under the same uncontrollable thirst of excitement which drives other men to drams and opium. It is for this reason that the conversation of a set of simply well-educated men of moderate talents is often found more agreeable than that of a set of clever writers or celebrated orators.

THE GOLD-SEEKERS.

THE insatiable thirst for gold which distinguished the early Spanish conquerors of South America, is still a characteristic of many of their descendants, who form part of a nomadic population that frequent the immense and scantily-peopled regions lying between the United States and the fertile provinces of northern Mexico. The three great branches of the commerce of the country here find a host of lawless representatives. The hunters are the most active supporters of the trade in skins and furs; that in leather and cattle is followed by the *vagueros*; while that in precious metals falls to the lot of the *gambusinos*, or gold-seekers. The work of a recent traveller presents us with some particulars concerning the habits and precarious mode of life of the latter, which, in the highest degree adventurous, are comparatively but little known.

Under the denomination of *gambusinos* is included a host of vagabond miners, practical metallurgists, who seem endowed with a marvellous instinct for the discovery of veins of gold, more abundant in the north than in any other part of the States. Without capital to carry on subterranean excavations, they are obliged to content themselves with skimming the surface. Their wonderful tact is assisted by certain general indications. The matrix of the mineral is almost always composed of quartz rocks, which in some spaces are scattered for leagues over the scorched soil in irregular projecting masses called *crestones*. The *gambusino* never travels without his *barreta*, a pointed iron bar. By the aid of this instrument he detaches portions of the rock, which he afterwards submits to the action of a violent fire, and continues or abandons his labour in accordance with the quantity of mineral they contain. Sometimes a fragment breaks off glittering with grains of gold; the solitary explorer then labours with redoubled energy, and forgets all his privations while following the vein, which he pursues until it penetrates too deeply into the earth. He then sells the mine to any one able to buy it, and, like the American squatter, removes without regret to a new field of labour. The same instinct leads the *gambusinos* to explore the rivers for gold dust; this is, if possible, a more dangerous and exciting occupation than the other. They follow the rivers and torrents to their sources in the mountains, meeting frequently in their adventurous journeys with the Indians, who are vigilant competitors in the same occupation, and kill the intruders without mercy. Sometimes, by diverting a stream, they discover a vein of metal which repays them for all their fatigues, sufferings, and privations; and on their

return, laden with booty, whole families, excited by the promise of wealth, set out to brave the dangers of the wilderness in search of the El Dorado. In some instances the greatest discoveries are made when least expected, at times of such a nature as to rival the wonders of fairy tales. Enormous lumps of gold have been found in the dead ashes of the camp fire, or among the shapeless blocks of stone that strew the surface of the soil; some have been seen by casual adventurers of a dazzling brightness, a certain indication of mineral wealth. According to calculations, one-fourth part of the gold annually exported by Mexico is collected by the labours of the *gambusinos*.

The head-quarters of the gold-seekers are two villages, Bacuache and Nacoma, situated at opposite sides of the mountain-chain washed by the two branches of the river Uris. They are separated by an arid desert of many leagues in extent from other civilised communities, and the inhabitants of one village regard the others with mortal enmity, and take every opportunity to cut off parties or individuals whom they encounter while exploring the mountain. Desirous of making himself acquainted with the locality, which presents many interesting geological features, and with the people, the writer of the narrative about to be given set out with a guide to visit them. During the first day's journey, the latter held on his way seemingly unconscious of the presence of a companion; but at nightfall he reined up his horse, saying, as he seized the other's bridle, 'What can be better? Here we have water for ourselves, grass for our horses, plenty of wood, and, above all, in these blue-flowered lianas we have a sovereign remedy against serpent bites. Do you not admire,' he added, while unsaddling the horses, 'how Providence has always placed the remedy by the side of the danger? Wherever you see the lianas, it is a sign that rattlesnakes are in abundance. Do you see that bird yonder like a pheasant flying round and round above us, and that black one, about the size of a pigeon? They are the two most formidable enemies of the snakes, and they are endowed with an admirable instinct for their destruction. Their presence here proves what I said—that these places are infested with serpents.'

'Then why stop here?' inquired the traveller, whom we shall now leave to narrate his own tale.

'Because,' replied Anastasio the guide, 'we shall find the same inconvenience everywhere, without being certain of the same advantages.'

So saying, he threw the two heavy saddles on the ground, and spreading the sheepskins on one side, requested me to lie down while he prepared supper. After the meal, while stretched on my temporary bed with a saddle for a pillow, I asked my companion whether he had ever been to Bacuache. He smiled at what he considered the simplicity of the question, and replied that every one went at least once in his life.

'And were you not tempted to become a gold-seeker?' I inquired.

To which he rejoined in a melancholy tone, 'No; it is sometimes a horrible trade, and my apprenticeship to it disgusted me for ever.'

At my request Anastasio proceeded:—'I was scarcely fifteen years old—now I am thirty-five—when my father, who was an enterprising *gambusino*, heard of a valuable *plant* of gold, and took me and my two brothers to go and search it. The accounts given by my father's informant, who accompanied us, had so inflamed our imaginations, that we lost no time on the way. At the end of the sixth day we reached the last settlement on the borders of the desert, where we each contributed something towards paying for a mass before continuing our journey. The plant of which we were in quest was on the edge of a small stream, but before reaching it, we had to cross the hot sandy plains where not a drop of water was to be met with. One evening we were dying of thirst, with only a single gourd full of water left among five. So great was our suffering, that at last we began to fight for possession of the gourd. In the heat of the struggle a blow with a knife

was struck, and my father fell stabbed by the hand of his friend. At the sight of the blood streaming from the wound, my elder brother inflicted summary vengeance upon the assailant. We gathered round our father, who, in the agony occasioned by his wound, begged vehemently for water. I rushed to the gourd, but, alas! all its contents had been lost by being upset in our quarrel! The night came on, during which our parent's intreaties for water, growing fainter and fainter, were the only sounds that disturbed the awful silence of the desert. We wandered about like madmen, without knowing what to do to comfort him: there was nothing around us but bare sand. At last my father's moanings ceased—he was dead! I wept by his side till the sun rose, when in the sand, reddened by the blood that had flowed from the wound, we saw the glitter of gold. But I need not tell you, *senor*, that not one of us would touch it. We consulted together: he who could have guided us to the plant was dead, and we were compelled to retrace our steps, after burying the dead body of our father, but leaving the other to bleach upon the sand. That is the reason why I have disliked the trade of gold-seeker ever since.'

'And what became of your brothers?' I asked, as Anastasio came to a pause.

'The eldest, like myself, determined not to be a gambusino; but Pedro, the next to me, kept on; I daresay we shall find him at Bacuache.'

After two days of further travel we reached the savage valley in which Bacuache is situated; small parties of men, reckless and brutal in appearance, were washing gold in the beds of the rapid streams that ran down the mountain. To Anastasio's inquiry for his brother, they replied by pointing to a torrent on the opposite side of the valley. We rode to the place indicated, where, on climbing the slope, we found a man up to his waist in the stream, busily engaged in constructing a dam, by piling stones one on the other. It was Pedro. A cordial, and even solemn recognition took place between the brothers, who had not seen each other for some years. Pedro invited us to take up our quarters in his hut, informing us at the same time that we ran considerable risk, as the gambusinos of Nacoma were at open war with those of Bacuache. I alighted, and seated myself on the bank of the torrent, as the gold-seeker still continued to work at the dam, and questioned him as to the cause of his wish to divert the stream.

'*Senor*,' replied Pedro, 'from the fall that you see up yonder to this place, there is not a pebble or grain of sand in the brook that has not been through my hands: the result is beyond my hopes, and that is why I began the dam, now almost finished.' This answer left me as far as ever from the object of my inquiry; and Pedro continued, at the same time taking a lump of gold about the size of a nut, with the edges sharp and unworn, from a leathern bag concealed beneath his shirt: 'Listen,' he said: 'what would you think of the plant you were searching, if you found such a specimen as this?'

'That the vein was not far off,' I rejoined; 'since there has not been time for the lump to become worn by friction.'

'True,' was the reply; 'and the slope about here is the place where it came from.'

'But are you not afraid of being attacked by those who may envy you your good fortune?'

'I am prepared for it,' answered the gambusino; 'but do not fear it. From my infancy I have been accustomed to the dangers of my profession. I have learned prudence as well as daring, and hid away in safety a considerable part of my booty. In case of misfortune, I shall reveal the hidingplace to my brother Anastasio. Do not think, *senor*, that it is cupidity that urges me on, in thus risking my life so frequently in our scorching deserts: I only obey an invincible instinct. I am like the torrent destined to carry down and scatter gold in the plains.'

While speaking, the gambusino had kept on working at the dam, and the bed of the stream was now nearly dry. Believing himself near the source of the gold, he

plunged his two hands into the soft soil, and brought up a quantity of clayey gravel, which he washed carefully in a large wooden bowl provided for the purpose. No signs of gold were visible, until, after repeated trials, a few minute grains glistened in the sediment. These the gold-seeker collected, placing them in a small piece of reed, and stopping the ends with wax. He then went twenty paces lower down the stream, where the first handfuls of soil contained several lumps of gold. Here was an indication that the vein lay somewhere between the two places where the earth had been taken up for washing. Sure of the locality, the gambusino seized his pike and drove it vigorously into the bank, where it struck against a rock. After repeated blows, a piece of the hard stone was knocked off, which he examined with a perfectly immovable countenance. At last, placing a finger upon his lip, as though to recommend me to silence, he put on an appearance of disappointment, while depositing the fragment of quartz in one of the pockets of his vest; he then kicked down the stones of which the dam was constructed, the water again leaped along in its original course, and hid all traces of his labours.

With the same disappointed air he then invited me to follow him to his cabin, whither Anastasio had already preceded us. No sooner, however, had we entered and closed the door, than Pedro immediately changed his demeanour, which had been assumed to deceive any lurking spies without, and cried joyfully, as he tossed the piece of stone to his brother, 'You were right, Anastasio; the past has done nothing for me yet, but what ought to be the future of the owner of a vein like that? Still more gold,' he added with enthusiasm, 'which will see the light, and pass from hand to hand.'

After Anastasio had expressed his admiration and astonishment at the beauty of the specimen, delicately lined in every direction with threads of gold, the labours of the eventful day ceased, and we all retired to rest. I had been asleep for some hours, when a sudden glare of light and a confused shouting awoke me. I started up. On the opposite side of the valley a tall pine-tree was wrapped in flames, from the trunk below to the topmost branches. A number of men were running wildly about in the light of the raging fire, shouting, 'Nacoma, Nacoma!' Anastasio and Pedro were already armed, and prepared to join in repelling what was supposed to be an attack of the people from the village on the opposite side of the mountain. My guide took the opportunity to represent to his brother the dangers of the perilous trade he had chosen, and to persuade him to abandon it. But shaking his head, Pedro replied with an emphatic 'Never!' and pointing to a dark corner of the hut, showed me his partner lying wounded on a low bed.

'To abandon him now,' he said, 'would be to kill him. A few days more will decide his fate. I count upon your generosity, *senor*: you will stay and protect him while we go on the scout. Should I not return, dig up the earth under that bed, and you will find the store of gold which I have collected on this plant. There is enough to give my poor associate Christian burial, and to be of good service to you in addition. It is a secret which I have never intrusted to any human being, but it would be a pity that it should not see the day and circulate.'

The gambusino turned to leave the hut with Anastasio, but checked himself, as he made a remark which revealed more of his singular character. 'In case you fear taking charge of such an inheritance, by reason of the attempts that might be made to deprive you of it, scatter it rather than leave it buried; for once out of the earth, gold is made for man's profit—such is the will of Providence.'

At these words the brothers left the hut with cutlasses in their hands. I sat for some time musing on my strange position, and listening for the sounds of strife, which I doubted not would soon disturb the silence. Pedro and my guide, however, were not long absent. The alarm was a false one. The fire, now scarcely perceptible, had been kindled by a poor maniac, in triumph over the death of two of the gold-seekers, who, he fancied, had waylaid and murdered his only son. At the end of six days I left Bacuache with Anastasio, glad to quit a

district where no law was respected but that of the strongest. Some time afterwards, I heard that Pedro, faithful to his vocation, and the extraordinary impulses by which he was actuated, had sold the rich vein at whose discovery I was present, and betaken himself once more to the perilous occupation of gold-seeking—scaling the rugged heights, and penetrating deeper into the savage ravines of the range, with a perseverance and energy that were to cease only in one of the numerous fatalities incident to his adventurous profession. I was much impressed by the sincerity with which he regarded himself as an instrument in the hands of Providence for the discovery of gold that would otherwise have remained hidden; and have preserved this record of my acquaintance with him as an extraordinary instance of apparently disinterested, though mistaken character, in a country where treachery and violence have long been the principal social elements.

A DAY IN THE SALT DISTRICTS.

'ARE you for Northwich?' was my inquiry on leaving the train at the Chelford station of the North-Western Railway, addressed to the driver of an uncommonly smart omnibus, painted in vermilion and white, and horsed with a capital pair of animals, whose appearance was eloquent of good fare, good grooming, and a considerate whip. 'Yes, sir,' was the reply; and jumping up, I was soon seated by his side, and on my way to the saliferous regions of the 'wiches,' as the Cheshire folk call them. An hour's ride through smiling fields, along a road whose borders glittered with wayside flowers of every kind and hue, now overhung with far-extending branches, now mounting up a gentle hill, and creeping across a green common, now descending, and threading the depths of a miniature forest, where rank vegetation marked the quiet course of a shallow, but silent river, brought us to Knutsford. This is an old-fashioned, but clean and wholesome-looking town, consisting of a few streets, a church, a large jail, and a factory or two. Changing horses at a tavern, a little in front of which was an angel on a great sign, employed in the unangelic office of squeezing two bunches of grapes, while further on up the street—which was full of inns and taverns—gleamed the more terrific representation of St George dealing summarily with one of the *Sauri*, we were again on our way to our destination. Three-quarters of an hour more brought us in sight of Northwich, whose hazy atmosphere, polluted by the smoke of a number of large chimneys, marks its position before it can be actually descried by the traveller. Approaching nearer, the tall shafts of the salt-mines, with their engine-houses of bright-red brick, at the upper part of which the half-beam of the labouring steam-engine may be seen in ceaseless motion, dragging up to the light of day the secret treasures of the earth, assure us that we have actually entered the salt district, the exploration of which was the special object of our visit. Dismounting from the florid vehicle, and unpocketing an introductory letter to a resident friend, I was soon put in the way of getting together all the information I was in quest of upon this important trade and manufacture. Being kindly received by the proprietor of one or two extensive mines of rock-salt, I was escorted by him to a very large and old salt-mine in full work, and taking a guide with me, I prepared to descend with him in a salt bucket. But before taking the reader down with us, a remark must be made upon the aspect and character of the salt regions.

If we ascend any elevation in this neighbourhood, commanding a prospect of any extent, it is impossible not to be struck with the level aspect of the land in every direction, interrupted, however, occasionally by a few insignificant hills, which are in some places isolated, while in others they form determinate lines dividing the country into sections. In the most southern of

these salt is found almost exclusively, being confined to the valleys of the Weaver River and those of its tributary streams. This section of the Cheshire plain is remarkable for the disposition of its hills, which are so arranged as to form a basin of considerable extent at its inner borders, but narrowing as it approaches the sea. The river Weaver, at first an insignificant stream, but enlarged by subsequent additions, and by the hand of man, into a navigable current, has its course through the central portion of this basin. Standing in this position, and looking on so large a tract of land, whose level surface is only broken for some distance by woody knolls, it requires but a small effort of the imagination to carry back the mind to the time when curling waters occupied the space now adorned with woods, green pastures, and yellow corn-fields, and enlivened by gentlemen's country-seats, and labourers' cottages, or nearer at hand by the busy, steaming, smoking town of Northwich itself.

The pit's mouth, however, is no place for a reverie, as every minute brings up great loads of rock-salt, which are seized by a couple of half-naked brawny men, and cast into carts, waiting to be filled. Nor, indeed, did I and my companion look very imaginative persons, as with rusty old hats, the manufacture of some long bygone period, and miners' jackets, all grimy with earth-stains, and other suitable apparel, we got into the bucket, and began to descend into the mine. Going down is a far more unpleasant sensation than that of ascending; and as by and by we got lower and lower, until we lost the daylight, and sank by jerks, which told us we were at the mercy of the panting iron giant above, down and down into the still, cold, and dark pit, a strange unearthly feeling crept over us, which was not altogether dissipated by the jerk of the bucket upon the solid floor at the bottom of the pit. We both jumped out, and trod with uncertain steps the dry rock-salt under our feet. All seemed impenetrable darkness, save for the twinkling of a few miners' candles here and there. My guide, more accustomed to the transition, was soon able to see as well as in daylight, but my eyes refused their office for at least ten minutes, after which most objects became tolerably visible, and were increasingly so to the end of my stay in these subterranean regions. As the period of my visit was in the middle of summer, and on a warm, sunny day, the impression as to temperature was that of cold. The air, however, was very dry, and as there was no perceptible current, the coldness was not disagreeable. Miners were busily engaged in all parts of the mine. Some were labouring with the 'pick,' detaching masses of rock-salt from the roof or sides of the galleries; others were loading trucks with the salt; and others were rushing at a great rate with the trucks to and from the mouth of the shaft. Vistas, lit up with here and there a candle, stretched away in every direction from this point, and conveyed a strong impression as to the extent of the mine, which was increased by the impossibility of assigning any bounds to it by the eye. As the guide preceded me, and lighted up the way by a feeble tallow candle, giving me another for my own course, it was easy to imagine that we were treading the pearly streets of some enchanter's hall, as at every step flashes of broken light gleamed from the floor or glanced from the sparry roof. The sight was indeed a curious one. At every twenty-five yards a great square pillar of glittering gems many yards in diameter upheld the roof, looking in the dim light of the abyss more like the work of giants than the results of the labours of men. Add to this the spectral appearance of men naked to the waist, hurrying to and fro, and the dancing lights on every side, and some conception of the singularity of the scene may be formed. After walking for some distance over an uneven, and oftentimes slippery pavement, we reached the extremity of one gallery. Here the guide proceeded to show the operation of blasting; and charging a drift-hole with mining powder, and calling out 'Fire!' as a signal to the

rest of the miners, he fired the train, while I remained at a respectful distance. A muffled report followed, and re-echoed in a strange manner along the galleries, while a considerable mass of the mineral was torn up, and more was so loosened as to be removed without excessive toil by the pickaxe. It was easy to trace the extent of the loosened portion by striking it with an iron rod, when it gave forth a hollow sound, the unshaken rock sounding as firm as though it were stone, and being, indeed, almost as hard. Mounting up heaps of broken rock to the roof of the mine, a most curious appearance presented itself. On the dark yellow surface of the rock-salt thus seen in a horizontal section, it was easy to discover a large number of different figures marked out in white. These were quite distinct from the marks of the miners' tools, and a close inspection showed that they were really in-grain markings. The figures formed assume different characters: some approach the circular, others are many-sided, and others form different mathematical figures. It is very difficult to explain the origin of these appearances. They consist of masses of impure rock-salt, surrounded by a narrow boundary line of the purest white salt. Occasionally the cross sections of such markings are visible in the sides of the mine. The aspect of the salt in the mine is more that of smoky quartz than anything else. It is far from being that clear transparent substance which appears to be the general idea formed of it. Often it is mixed with clay, or it is coloured of a dark-yellow or brown, or coral red. Sometimes it is met with pure white, and as pellucid as the clearest glass, being, indeed, of a whiter lustre than most crystal; and the guide said that masses of this kind were generally found in the immediate vicinity of masses of gravel or rock. They are generally kept for visitors. Leading the way to a cask of the salt jewels, he presented me with two or three fine specimens, in which the cubical form of the salt-crystal was admirably illustrated, and which, I was told, would serve hereafter as weather-glasses, the least humidity in the air being indicated by their surfaces. Never was a subterranean cavern so perfectly dry as this: no stalactites hung from the roof, no pools lay on the floor; so much, in fact, is this the case, that the miners are often somewhat harassed by the dust, and the truckway in many parts of the mine looked not unlike a macadamised road on a dry summer day. The temperature of the mine ranges from 45 to 50 degrees, and is pretty constant between these points summer and winter alike. In the excessively sultry weather of some years, owing to imperfect ventilation, the men suffer from impure air, and become painfully drowsy; but at all other periods they have excellent health, and consider their occupation a most salubrious one. We now returned to the shaft, and were slowly drawn up; and being more at our ease now, the nature of the strata perforated became an interesting occupation for our minds while ascending. The shaft is about 300 feet deep. We reached the surface at length in safety, and removing our underground apparel, were refreshed with a good wash in fair water.

The geology of these mines may be shortly mentioned. There are two beds of rock-salt—an upper and an inferior. These beds are both horizontally placed on their different levels. For a long time the existence of a lower bed was unknown: it was at length discovered by some adventurous persons who determined to go deeper, and were rewarded with the discovery of this the greatest deposit of the two. In fact the existence of salt in this form at all was only discovered by accident in boring for a coal-mine a century and a-half ago. The lower bed being found on its discovery to be of superior quality, the working of the upper was immediately abandoned, and it has lain unworked ever since. It is a remarkable fact, that the middle portion of this inferior bed is more free from foreign ingredients than the upper or the lower portions of the same bed. The thickness is variable. Until lately, it had never been entirely perforated. The friend who accom-

panied me stated that this had now been done to the depth of seventy feet, and that below the bottom bed clay and salt were found in alternate layers, the thickness of which varied from three inches to seven feet. Ascending toward the surface, above the lower bed, a stratum of indurated clay occurs, tinged variously, and as hard as stone: it is about thirty or thirty-five feet thick. Then comes the upper bed of rock-salt: this is from sixty to ninety feet in thickness. Above it are layers of clay and marl tinged red, brown, and blue, to the thickness of 120 feet, covered with the vegetable soil composing the surface. These beds of salt lie in a direction from north-east to south-west; their length is doubtful, but has been conjectured at from a mile and a-half to two miles. The breadth is more satisfactorily ascertained, as mines have been sunk on each side just beyond its boundaries. From these data it is probable that the transverse breadth of the salt-beds is not more than from 1000 to 1400 yards. It has been observed by one well acquainted with the district of which he wrote, that these beds appear to thin off in a direction from the sea, being thicker at the ends next the sea. It is remarkable that, so far as our knowledge extends, no organic remains have been discovered in any of the strata covering them, or in the fossil salt itself. The hills in the vicinity are sandstone rock. One of these, at some distance, called Alderley Edge, a very romantic spot, and a great resort of pic-nic parties, is a very curious one, containing fragments of stones rounded by attrition, and pieces of various ores—of lead, copper, cobalt, &c. The rocks which furnished the clay of the alluvial soil must either be at a great distance, or have been swept away under the footsteps of advancing years. The mines are sixteen in number. The celebrated Marston mine is one of great extent and antiquity, extending for many acres under ground. This mine has occasionally, on the visits of great personages, been illuminated, when it is said to present a spectacle more dazzling to the eye, and more attractive to the imagination, than can easily be conceived. A very strange occurrence took place in one of these mines, which is worth recording. The floor in a particular portion of it had long been suspected to be hollow, from the sound emitted when it was struck. Some persons at length determined to perforate it, and with a chisel and hammer they soon effected their object, when up burst through the hole a jet of *inflammable gas*, which took fire, and streamed up in a gigantic flame to the roof of the mine, full sixteen feet. The visitors were of course greatly alarmed, and made precipitate efforts to extinguish the blaze: this was at length effected, and the hole has been carefully stopped up ever since. It is singular that in America a similar occurrence took place in boring for salt; and it is difficult to assign any satisfactory reason for the production of this gas in such positions.

The total export of rock-salt is about from 60,000 to 70,000 tons a year; but if in full work, each mine is capable of affording a supply of 10,000 tons yearly; and the mass is so large, that this quantity might be mined for many years without materially diminishing the amount. Rock-salt is almost exclusively exported, a very small portion being retained for home use. The great mass is composed of pure crystals of common salt, or chloride of sodium, with clay, oxide of iron, traces of sulphate of lime, and magnesia. In a thousand parts, about fourteen would be different impurities. Sometimes a spring bursts into one of the pits, and its certain destruction is the consequence: the water dissolves away the pillars, the roof loses its support, and falls in, and the superincumbent soil follows, leaving a great hollow on the surface. Within sight of the mine from which we had just emerged was the scene of such a catastrophe; the deep gulf and crumbling walls of what had been an engine-house, with the manifest desolation of the spot, were the sad indications of a calamity which had involved some loss of life and a large loss of property.

Although very often confounded, a salt-mine and a salt-work are two entirely separate and distinct things. Having seen salt supplied by the hand of nature, I felt desirous of witnessing the preparation of the same article by the art of man. Our route lay across the river Weaver, the passage of which is effected by a curious serpentine embankment, terminating at the foot of the mound on which the works, together with a number of others, were situated. On entering, we were conducted to the evaporating-house. This is a room of 100 feet in breadth, but upwards of 2000 feet in length, so that the men working at the farthest end look quite diminutive when seen from the door. It is covered by a wooden roof, contrived in a peculiar manner to facilitate the escape of the steam from the salt-pans. The appearance it presents, with its clouds of white vapour and multitudes of half-clad men stirring and shovelling about the boiling brine, can scarcely be conceived. The heat of the house is excessive, though the abundant moisture of the air prevents its becoming annoying. The salt-pans are shallow vessels of iron, 80 feet in length, 20 in breadth, and about a foot and a-half in depth, thus exposing an enormous evaporating surface. The reader may form his ideas as to the size of the shed, by being informed that it contained seventeen of these spacious caldrons, each separated from the other by an interval of three or four feet, which formed the pathway for the removal of the salt. The pans are fed by pipes connected with the brine-reservoir, the supply being regulated by the amount of evaporation. The heat is supplied by four or five furnaces, the fires of which play under each pan, while all the many flues from this vast house terminate in a couple of tall chimneys at the side. On looking into the pans, they are seen to be in many instances partly filled with a white granular substance lying at the bottom, while a film of the same is continually forming at the top, and sinking downwards. Many of the pans, again, are seen to be bubbling and boiling with considerable vehemence, whilst in others the process goes on slowly. It is by this means that the various descriptions of salt are manufactured. The finest or lump salt is prepared by very quick boiling, and the pans are frequently raked about; it is then taken up in a shovel, and poured into wooden troughs perforated at the bottom, out of which the brine runs; when sufficiently dry, the salt is carried into the stoving-room to be stoved, after which it is fit for sale. Common salt is procured by a slower process of boiling: after the first set-off, when it is heated to the boiling-point of brine (225 degrees Fahrenheit), in order to precipitate some of its impurities—such as carbonate of lime and oxide of iron, which adhere with surprising tenacity to the bottom of the vessels, requiring even to be removed occasionally with the pickaxe—it is cast up in heaps by the side of the pans, and is 'drawn' every other day. Fishery salt is made in a slower manner still, the brine being only heated to 100 degrees Fahrenheit; but it is the strongest salt of all. A curious variety is called 'Sunday Salt;' it is large-grained, well-crystallised, and is formed by slackening the fires between Saturday and Monday. The men amuse themselves occasionally by making little ships of twigs, and immersing them in these solutions, and they soon become incrustated with the most brilliant white crystals. Thus the whole secret of the manufacture of these very different-looking varieties depends on the temperature at which the brine is evaporated.

By the side of this immense shed is a second, and beyond it a third, each containing a large number of pans, some of which were in full work, while others were unused. The stove-room between them is heated by the flues of the various furnaces; the floor of this room is covered with sheet-iron. At another portion of the building was the store-room, in which the salt is stored previous to shipment. It was calculated that this room would hold at least 10,000 tons of salt. The aver-

age production of these works alone is about 1000 tons a week, or upwards of 50,000 tons annually; an amount nearly equal to that of the whole sixteen rock-salt mines. The brine-spring, the ever-flowing source of this enormous amount of salt, is fortunately situated at a distant part of the works, and is drawn by a couple of pumps driven by a steam-engine. The brine is by this means pumped up into the reservoir, which is of considerable dimensions, formed of clay, and lined with bricks. It is as nearly as possible a saturated solution of salt; a crystal of salt not being dissolved by it when placed in the liquid, and an egg, which is the simple hydrometer in common use, lying high and dry upon its surface. It is conveyed hence by pipes to different parts of the works, the flow being regulated by a proper mechanical contrivance. It has been estimated that every pint contains about six ounces of salt. There is generally a small proportion of saline and earthy impurities present in it, but by proper care in the manufacture, these can be almost perfectly removed. There is nothing mysterious in these springs. They are formed, without doubt, simply by springs of water, originally fresh, permeating a vast bed of rock-salt, thus becoming saturated, and then rising to within a certain distance from the surface. Brine-springs have been wrought in these districts for a great length of time; they are mentioned in *Doomsday-Book*; and old Camden says that there was a sort of brine-well in this neighbourhood, with a stair about it, down which half-naked men went to draw the brine in leathern buckets, and then carried it to the wick-houses.

One of the most curious circumstances elicited by my visit remains to be mentioned. My road back led me by the side of other salt-works, and surprise was created by the number of chimneys which were grievously out of the perpendicular. One very large one was actually held up by a long chain, and raked as much as the spars of any fast-sailing clipper ever built. The ground, too, in various places had given way, and the road passed close by a land-slip of some size. The scene bore a faint resemblance to a territory shaken by an earthquake. Following up the inquiry, it was found that the embankment we had crossed was continually and steadily sinking; that a lake of some acres of surface had appeared only within a space of thirty or forty years; that under its waters were the sites of former salt-works; and a stump of a log was pointed out to us as the only relic of a cottage which was now buried in the waters: all these were evidences of a gradual subsidence of land of a very singular kind. An intelligent inhabitant assured us that a once favourite summer's walk of his lay through a deep part of what was now a lake. He stated also that many salt-works near this spot had been obliged to be removed to a distance, while those which were formerly far from the water became washed by it; and the water continuing (apparently) to rise, they were repeatedly compelled to raise their furnaces; and he doubted not that in three or four years they would be compelled to remove altogether. As far as could be ascertained, the rate of subsidence was about one foot in each year, or rather more. The inhabitants of the town are well aware of the fact, but the sinking goes on so slowly, as to give them no alarm. Many of the houses are screwed and bolted together to keep them secure. There is no doubt that this interesting, though destructive phenomenon is entirely due to the brine-springs; the immense quantity of salt annually removed by the water leaves a space which is filled by the subsidence of the superincumbent soil, and this sinking below the river's level, is immediately covered with water on the surface. If these salt-works continue to be prosecuted with their present vigour, the time will come when the busy Northwich will have found a grave beneath the waters of the Weaver; but this time will not be seen by the present, nor probably by the next generation. The entire produce of the Cheshire salt district is estimated at 400,000 tons a year, or four-fifths of the entire pro-

duce of Great Britain. An equally pleasant ride back, and a rapid hour's whirl at the tail of the iron horse, terminated our day in the salt districts by conveying us home.

ROBESPIERRE.

MONSTER as Robespierre is stamped in the judgment of mankind, there can be no good reason why his life should not be written. It has been undertaken by Mr G. H. Lewes,* and executed with spirit and fidelity, but within limits which we suspect will be generally felt as too narrow for the subject. It appears that Robespierre was probably descended from an Irish immigrant of the sixteenth century: Mr Lewes conjectures that he may have been a person named Robert Spiers. Prince Charles Stuart planted a freemason lodge at Arras in 1744, and 'confided the presidency of it to his old friend, Robespierre's father.' Of the early days of our hero no anecdotes have been preserved. It is made plain, however, that he was distinguished at school, and was looked upon at Arras as a young man of talent, both in the exercise of his profession as a barrister, and in the cultivation of literature. The philosophical ideas of Rousseau—the original equality of all mankind, the foundation of society in a contract made by all for the good of all, and the sole foundation of property being the expenditure of labour upon it—these formed the favourite dogmas of Robespierre, and were at the bottom of much of his political conduct. Mr Lewes remarks pertinently on one of them:—'This contract is altogether illusory: no one's consent was ever asked or given. . . . The time will come when society will be a contract—when government will be made by all for the good of all; but Rousseau should have placed his ideal in the future instead of in the past.' Robespierre also participated in the religious ideas of Rousseau, which were at once heterodox and intolerant. This is a curious and unexpected feature in the great Terrorist. He was at every period of his career distinguished from the bulk of his fellows by a sincere and earnest theism; and this, indeed, was partly the cause of his ruin.

Mr Lewes takes, we think, in the main, the right view of the character of Robespierre. He was not naturally a sanguinary man (he resigned his situation as judge in the criminal court at Arras, from disgust at having to condemn a murderer to death)—he was only a fanatic, who, having once set out in the advocacy of an idea which he thought of consummate importance to the whole public, scrupled at no minor immediate sacrifices for its realisation, though these might infer much bloodshed. One of the most remarkable acts of his early obscure days, was to take up the cause of certain peasants against the injustice of the bishop-ruler of the town, notwithstanding that the bishop had been his own patron. In this sacrifice of his own feelings, and incurring a possible stigma for the sake of a principle, we see, Mr Lewes thinks, the germ of a fanatic. Robespierre had tolerably clear perceptions of right and justice; his deficiency lay in those affections which soften the hard affairs of human life.

In the States-General and Constituent Assembly he was at first, as is generally known, overlooked as an insignificant person, his mean spare figure, pinched countenance, and reserved manner, being of course much against him. By industry in cultivating his oratorical talents, and by a rigid adherence to his own idea of the public good, he gradually acquired importance. One observes, nevertheless, on a careful examination of the history of the Revolution, that Robespierre was wanting on almost all the signal occasions. The secret of this was his timidity. Strange to say, the man who floated upon the top of revolutionary violence for so consider-

able a time, was a coward! He only could make an appearance when, through the operations of others, things had become decided in a particular course. The glory of Robespierre is that which is essential to all fanaticism—his disinterestedness and incorruptibility. He lived in the garret room of an obscure carpenter, giving out of his salary of eighteen francs a day as a representative one-fourth to his sister, another to his mistress, and living frugally on the remainder, sometimes positively at a loss for decent clothes. His ultimate scheme of life was to marry one of the carpenter's daughters, and retire to live obscurely in the country. But Mr Lewes justly remarks that money is not the only corruption that avails with public men. 'The voluptuous soul of Mirabeau was not more *averse* of pleasure than the vain ambitious soul of Robespierre was of applause. . . . I accuse him of having flattered the mob, which flattered him; of having shaped his convictions so as to gain the applause of men whom he should have ruled and enlightened. . . . I accuse him of having uttered language which in his heart he knew was false, and that at a time when such language was translated into bloody acts.' Here we are not quite sure that Mr Lewes is right. Vanity, doubtless, had great sway with Robespierre; but any specimens of his oratory given in this work express only such sentiments regarding the people as might be presumed to flow from the man's convictions, as these are represented to us by Mr Lewes himself. We suspect that the fanaticism accounts for all, or nearly all.

The British public is, we believe, little acquainted with the oratory of Robespierre. It seems to us as in general very far above mediocrity. In connection with the above remarks, we may adduce a specimen in which he says no more in favour of the people than may fairly be supposed to have been sincere:—'The mass of the nation,' said he, 'is good, and worthy of liberty; its real wish is always the wish of justice, and the expression of general interest. A particular corporation may be corrupted, however imposing the name which decorated it, as you may poison stagnant water; but you cannot corrupt the whole nation, for the same reason that you cannot poison the ocean. The people, that immense and laborious class—the people, I say, are not open to those causes of depravation which affect the so-called superior classes. The interest of the weak is justice. It is for them that humane and impartial laws are a necessary safeguard. The people know neither idleness nor ambition, which are the two most fruitful sources of our evils and our vices. The people are nearer to nature, and less depraved, precisely because they have not received that false education which, under despotic governments, is a perpetual lesson of falsehood, of baseness, and of servitude. Compare courtiers with artisans, who in this respect are found at the two extremes of the scale. Witness our whole Revolution, every epoch of which is marked by the courage, by the disinterestedness, by the moderation, and by the generosity of the people; and by the cowardice, by the treachery, by the perjury, and by the venality of those who would raise themselves above them. Vile egotists and infamous conspirators feign to believe nothing of the kind. They obstinately continue to calumniate the people, and to degrade them. Not content with having enriched themselves by their spoils, they look upon that day as a fortunate one in which they may bathe themselves in the blood of the people. They assemble the satellites of foreign tyrants against the people; they render divine honours to assassins; they have on their side power, treasures, force, arms; the people has only its misery and celestial justice! It is this great cause we have to plead before the face of the universe!'

As to his dispositions at a cool moment with regard to the shedding of blood—'The news,' said he, 'having been brought to Athens that some citizens at Argos had been doomed to death, the people ran to the temple, and prayed to the gods to turn aside the

* The Life of Maximilien Robespierre, with Extracts from his Unpublished Correspondence. By G. H. Lewes, author of 'Ranthorpe,' the 'Biographical History of Philosophy,' &c. London: Chapman and Hall. 1649.

Argives from such cruel and fatal thoughts. I am about to pray, not the gods, but the legislators, who should be interpreters of those eternal laws which the Deity has implanted in the human heart, to efface from the code of the French those laws of blood which command *judicial murders*; and which our feelings and the new constitution alike repel. I will prove that the punishment of death is essentially unjust; secondly, that it has no tendency to repress crimes; and thirdly, that it multiplies offences much more than it diminishes them. Before society is formed, and law established, if I am attacked by an assassin or a robber, I must kill him, or be killed myself; but in civilised society, when the power of all is concentrated against one alone, what principle, either of justice or necessity, can authorise the punishment of death? The conqueror who kills his prisoner in cold blood is justly stigmatised as a barbarian. A grown man, who murders a child whom he can disarm and punish, appears a monster. An accused person whom the law has condemned, is neither more nor less than a vanquished and powerless enemy. He is more at your mercy than a child before a grown man. In the eyes of justice and mercy, therefore, these death-scenes, which are got up with so much solemnity, are *nothing less than base assassinations*; solemn crimes committed not by individuals, but by entire nations, and of which every individual must bear the responsibility. The punishment of death is necessary, say the partisans of ancient barbarity. Without it there can be no adequate security against crime. Who tells you so? Have you really estimated the springs which move the human heart? Learn to how many things does the catalogue of human woes tell you that death is a relief. The love of life yields to pride, the most injurious of all passions which destroy the heart. It is often sought after as a cessation from pain by the lover, the bankrupt, and the drunkard. The punishment, which is really overwhelming, is opprobrium—the general expression of public execration. No one seeks it as a refuge from the ills of life. When the legislator can strike the guilty in so many ways, merciful, yet terrible, bloodless, yet efficacious, why should he ever recur to the hazard of a public execution? The legislator who prefers death to the milder chastisements within his power, outrages every feeling, and brutalises the minds of the people. Such a legislator resembles the cruel preceptor who, by the frequent use of punishment, degrades and hardens the mind of his pupil. Listen to the voice of justice and of reason. It tells us that human judgments are never certain enough for society to condemn a man to death; those who condemn him being men, and subject to error. If you had imagined the most perfect judicial procedure, if you had found judges the most honest and the most enlightened, there would still always remain some place for error. Wherefore will you, then, interdict all means of repairing your error? Of what use are sterile regrets, illusory reparations, which you accord to a vain shadow, to the insensible remains of your victim? They are the sad witnesses of the barbarous temerity of your penal laws. To take away from man the possibility of his expiating his misdeed by his repentance, or by acts of virtue, is pitilessly to close against him all return to virtue, to his self-esteem; and to hasten him to the tomb, covered with the stain of his recent crime, which is in my eyes the most horrible refinement of cruelty.

It is the mark of weak writers and ordinary thinkers to take but one self-consistent view of any human character. Human nature is in reality remarkable for nothing so much as its inconsistencies. Men change with circumstances, and even independently of them. It ought not, therefore, to be exceedingly surprising to find that this man, who acquired by public acts the reputation of an inhuman monster, was beloved in the family where he lodged, and by many other persons, and that nearly the whole strain of his conduct as a politician could be interpreted into a kind of philanthropy prose-

cuted under difficulties. Mr Lewes tells a whimsical anecdote, which may help in its own way to illustrate the character of the man.

'There is now living,' says our author, 'in Paris, a certain M. Legrand, who boasts of his acquaintance with Robespierre, whom he regards as "the best abused man" of his acquaintance. To him Robespierre was a "very amiable man in society." He only thinks of him in that light. The Reign of Terror is a sort of nightmare—he no longer thinks of it. The "incorruptible" to him is no fierce demagogue hounding on the passions of an excited nation—no vain pedagogue, striving by words of reason to calm those passions—but a pleasant, amiable, gentlemanly fellow enough, whom he delights to remember. There is one story he always tells; and I regret that I must spoil it in the telling, wherein so much depends upon the gesture, and the quiet senile tone of voice; but such as it is, it will, I think, amuse the reader:—"Je me rappelle qu'une fois étant chez la famille Lebas . . . où il allait très souvent . . . j'entends du bruit sur l'escalier. "Tiens!" me suis-je écrié. "Je parie que c'est ce farceur de Robespierre . . . car il était très gai . . . en société (this epithet of *farceur* is very piquant!) Effectivement c'était lui. Il entre dans le salon . . . je m'approche de lui, et je lui dis: "Citoyen tu sais . . . ou tu dois savoir . . . que M. Legrand, un parent à moi—eh bien! il est condamné, et demain matin . . . (here a very significant gesture imitative of the guillotine completes the sentence) . . . Un homme, citoyen, dont l'innocence m'est prouvée! dont je réponds comme de moi-même! . . . Et la vie d'un innocent, citoyen, c'est quelque chose—quoi!" Alors il me répond: "Voyons, voyons, votre affaire" . . . (car il était fort aimable en société—M. de Robespierre!) Je lui conta la chose; alors il me demande: "A quelle heure ton ami doit-il mourir?" . . . (car il était fort aimable en société—M. de Robespierre.) . . . "Citoyen," que lui réponds, "c'est à neuf heures précises!"—"A neuf heures! c'est fâcheux! car tu sais que je travaille tard; ainsi comme je me couche tard, je me lève tard. Je crains que je ne sois pas levé en temps de sauver votre ami . . . mais nous verrons, nous verrons!" . . . (car il était fort aimable en société—M. de Robespierre.) After a short pause, he continues: "Il paraît . . . que M. de Robespierre avait beaucoup travaillé cette nuit: car mon pauvre ami!" . . . (Here again the guillotining gesture.) "C'est égal! Je suis sûr que s'il n'avait pas tant travaillé, il aurait sauvé mon pauvre ami . . . car il était fort aimable en société—M. de Robespierre."

It is interesting and satisfactory to observe the progress of truth in even such a case as that of Robespierre. The exigency which drove into sanguinary measures a man who naturally started at the very idea of judicial death, also caused his character to be regarded by his fellow-creatures as something beyond nature. By and by, terror and rage cool down, and our sense of the naturalness of all things is pleased to find that Robespierre was, after all, nothing more or less than a man.

TWO AFFAIRS OF HONOUR.

THE duel is by far the most curious relic of barbarism that has come down to modern times. In the dark ages it was simply the law of the strong, afterwards modified and harmonised by the forms and pageants of chivalry. But so far from passing away with other mediæval customs, in the first eighteen years of the reign of the 'good Henri Quatre' the lives of 4000 gentlemen of France were sacrificed to the Moloch which men fantastically called Honour; and in the time of Louis XIII., we are told by Lord Herbert that at Paris the question asked by acquaintances in the morning was not, 'What is the news?' but, 'Who fought yesterday?'

Now that this hideous absurdity seems, in England at least, to be passing fairly out of fashion, one is surprised to think how men, in any tolerably enlightened age, could have been such fools or cowards as to submit

to a law so tyrannical and irrational. It is easy to conceive that a bully, confident in his brute nerves, dexterous aim, or practised swordsmanship, might desire to employ these advantages in revenging himself upon his enemy; but the odd thing is, that the enemy, possessing perhaps neither nerve, dexterity, nor practice, should have felt himself compelled, in defiance both of the law and the Gospel, to 'go out' at the command of the other, and allow himself to be slaughtered like a calf! We all remember the story of 'Fighting Fitzgerald,' when he determined to be 'chosed' a member of Brooks's, and the nervous shrinking and prevarication of admirals, generals, lords, and commoners, when the bully marched into the club-room, and inquired of each in turn who it was that had blackballed him? 'Is it you, sur, who has been after blackballing an Irish jontleman—a jontleman both by father and mother—and a jontleman—(a general laugh)—a jontleman, I say (in a voice of thunder), *who never missed his man?*' Not one would own the grave offence; and Fitzgerald, calling for a bottle of champagne, sat coolly down to enjoy himself, remarking that 'he knew he was chose—that he was sure the blackballing was all a mistake!'

But now that men have at length thrown off the bondage of bullyism, or at least are in the act of doing so, we cannot shut our eyes upon the fact, that there is one class of the community which will suffer by the change: this is the class of dramatic authors. To say nothing of the duel itself being a stock incident in the modern comedy, the laws of 'honour' are among the principal moral agents of the piece. The revolution in manners, therefore, now in progress, will here be productive of some embarrassment, and in conjunction with the melancholy deprivation of highwaymen, and by and by of Scotch marriages, will perhaps eventually drive the dramatists into a new field. If these gentlemen, however, read as industriously as they write, there would be no occasion to despair for some time to come, at least in the case of the melodrama. They would learn that their Terrific Combats have grown nauseous, not from repetition of the fact, but of the manner; and they would discover in the duelling customs of foreign countries enough of novelty to enable them to make the hair of their audience stand on end for years to come. To prove this, we shall now present them with a recital of two affairs of honour, one occurring in Africa, and the other in Asia; and we choose these examples the rather that most writers on the duel deny the existence of the practice in Eastern countries.

Our first scene is laid in Kordofan, one of the most southern provinces of Egypt, lying between the deserts of Dongola and Darfur, and stretching away southwards into the *terra incognita* of the continent. The Dongolavi are the wealthiest tribe in the country, and are distinguished from the other inhabitants by wearing long shirts with wide sleeves, and a small white cap, with a shawl of the same colour wrapped round it in the manner of a Turkish turban. The married women are swathed in the folds of an ample cotton cloth, the end of which hangs gracefully over one shoulder; their eyelids are adorned with powdered antimony, and their noses, fingers, wrists, and ankles, with rings of copper or silver; and their woolly hair is arranged, with infinite labour, in hundreds of small curls, which they are so afraid of disarranging, that they frequently sleep on a couch with a hollow to admit the coiffure.

These Dongolavi belles, it may be supposed, are objects of considerable interest to the men; although this does not prevent them from being employed in the drudgery of servants, such as plaiting straw-mats, making wicker-baskets, so closely interlaced, as to be used for milk vessels, and even tanning leather, while the lords of the creation look gravely on smoking their pipes. But when the labours of the day are ended, then come the compensations of the women. The sound of the tarabaka, a drum beaten by the hand, calls the inhabitants to a blazing fire, lighted here and there before the houses; where the men, with their glittering

wives, sit down in a circle, and all begin to sing in chorus. Presently there bounds into the circle an unmarried girl, who performs a dance to the measure of the tune, marked by the beating of hands. At this moment all her labours are forgotten. She is constitutionally merry and thoughtless, but now she is wild with delight; and although her hard work had probably lasted without intermission from early morning, all symptoms of weariness disappear, and in the course of the dance she performs feats of muscular strength, though moving her feet but little, such as in England we only see on the stage. The movements are at first slow, but increase gradually in rapidity, till, as an eye-witness remarks, you can hardly persuade yourself that you are actually looking on a human being, and not on a thing of springs and wires. When she has danced herself out, she retires, and another takes her place; and so on till the whole girlhood of the party is satisfied, which rarely takes place before midnight.

When one of these dancers has particularly distinguished herself, she is called back by the spectators, as is the fashion in Europe, to receive their plaudits; and here, as a special honour, she is made to stand forth, while a sword is flourished over her head. This ceremony is performed by her admirer; but alas! it sometimes happens in Kordofan, as elsewhere, that she has more than one; and thus are introduced into the happy party jealousies and heartburnings, to be followed on the morrow by blows and blood. Let us suppose that a quarrel has occurred. Let us raise our curtain upon the fateful morning which is to determine it. Let us see whether there is not something novel as well as striking (without a pun) in the settlement of an African affair of honour.

The season is the beginning of spring, and the place one of the islands of the desert which form the country of Kordofan. The first shower has fallen; and nature, burnt up for months before to a cinder, has assumed, as if by magic, her livery of verdure and flowers. The grass rises to such a height, that in the fields people are aware of the approach of a passenger more by sound than sight. Creeping plants wind up the loftiest trees, and fling their gay streamers in triumph from the summit. Innumerable birds flutter through the groves, and fill the air with melody; butterflies and other insects vie with them in variety and gorgeousness of hue; and plants equally countless, and as brilliant, breathe forth so powerful a perfume, that the traveller of the desert is aware of his nearing the oasis before it comes in view, and feels a sort of intoxication steal over his senses as he seems to inhale

'Sabæan odours from the spicy shore.'

On the present occasion the village is pouring forth its crowd to a common centre at some little distance; and while an astonished ostrich is seen here and there spurring off, 'like a horseman that travels in haste,' the antelopes and giraffes browsing in the plain wait for a moment to gaze on the cavalcade before bounding out of its way.

The first arrivals are chiefly women, blazing in all the finery of rings, bracelets, and anklets; and adorned, besides, with strings of beads of Bohemian glass round their heads and necks, and with small round plates of gold depending upon their foreheads. Then come the men, armed with sword and dagger, the sheaths sometimes ornamented with agates, and the handles of massive silver. On their back is a large oval shield, and in a leathern quiver hanging from their shoulders a supply of spears or javelins. Some slaves carry an *angoreb*, used both as a bedstead and sofa, and covered with beautifully-variegated matting. This is set down among the trees, in a place affording sufficient shade, and yet spacious enough to hold the company. Among this company there is one young girl who seems to assume some airs of mingled modesty and importance. She is the distinguished dancer of the evening before, and is now the object of unusual attention, having been

raised by love and genius from domestic into public life. Among the men are the two duellists, as yet unarmed, and wholly uncovered, except by a cloth round the loins. Their dark skins, laboriously polished with various oils, shine like patent leather; and a novice in the spectacle that is to ensue would shrink at the idea that this beautiful surface is presently to be broken with wounds and dabbled with blood.

All is now ready. The duellists stand confronting each other, with only the narrow angoreb between them; and their weapons are put into their hands. What weapon? Pistol—spear—javelin? No: a whip! But it is no joke this whip, but a solid thong of the hide of the hippopotamus. Their friends endeavour for the last time to shake their resolution, to explain, and pacify: but all is in vain. How could it be otherwise when the lady of their love is standing by, when her reputation, as well as their own, hangs upon the issue, when her eyes are fixed upon their faces, and ready to detect the first symptom of a faltering heart? The young men are firm; and as the signal is at length given, one of them, who has the first fire, discharges his terrible whip upon the naked back of the other, with a force which makes the blood spout, and tears off the skin in a ribbon. A shout of applause rises from the spectators, for the youth has borne the lash without shrinking; and in his turn he now whirls the thong round his head, and makes it descend upon his rival between the shoulders. The result is the same; and, warming in the glorious game, the floggers ply their whips fiercer and faster, neither of them making the slightest attempt to elude the blow, but, on the contrary, disposing their bodies so as to receive its full benefit—for that is the Dongolavian point of honour. And so goes on the combat of force and endurance, till the bodies of both are one mass of exposed flesh, fringed with long strips of skin, and the blood pouring down their limbs, and forming a pool round their feet. Not the slightest expression of pain has been uttered by either party: but at length the strength of one of them fails; he is faint with the loss of blood, and unable, through fatigue, to return blow for blow; and, with an effort of perhaps still more courage than he has yet exhibited, he throws down his whip. This terminates the duel; the two combatants shake hands; and the spectators rend the air with their plaudits, and crowd around to congratulate them on their reconciliation. The lacerated backs are washed with cold water; plentiful draughts of merissa (a kind of beer) are quaffed by the whole assembly, and the cavalcade return to the village—in time no doubt for the evening dance.

Such is a Dongolavi duel; and any one may see that it requires infinitely more true courage to go through with it creditably than the sword or pistol combats of Europe. If Fighting Fitzgerald, on refusing to leave the room at Brooks's, had been offered this alternative, he would have made very few steps from the top to the bottom of the stairs, and we have a strong suspicion that he would never have been seen again in that quarter of the town in his life. But independently of the picturesque of the affair, which we trust we have made manifest, we would impress upon the dramatists the great moral lesson of which it is the direct and natural vehicle. It was a magnificent idea to place whips in the hands of the boy-men who settle their disputes by means of single combat; and without putting the government to the expense even of a thong, to make them leave the field with well-scourged backs, that would be sore and stiff, we will warrant you, for a month to come.

We must now turn to our second tableau, a duel decided with swords, but in a field of battle, so original, and, literally, so unearthly, that we wonder how the idea could have entered into people's heads at all. The affair came off on the borders of Sinde and Beloochistan, where the two countries are at odds with each other which is which. A feud had raged there for some time between two considerable tribes, to the great effusion of

blood and destruction of crops and flocks; and at length a khan, or chief, of the name of Buckree, addressed a letter to another called Fungus, proposing that the affair should be decided once for all by a personal encounter between them. Buckree, be it understood, was a Jack Ram, and Fungus a Bungoolzuddock—for these are the euphonious names of the two warring tribes to which the gentlemen severally belonged. Fungus accepted the cartel without hesitation, and a day and place were appointed.

In ordinary circumstances, the Beloochi women, who are somewhat of the plainest, are regarded by their lords as inferior animals, and are suffered unnoticed to get through the drudgery of the house as they think fit; but in any extraordinary exigence, such as a duel or a foray, they are taken into council, and their opinions listened to with singular respect. In fact it is only such exigencies that rouse the male sex at all, for at other times they do nothing but smoke, drink, sleep, and fatten. Accordingly, there was on the present occasion a great fluttering about the houses of the two chiefs of full petticoats and blue mantles, which, with trousers and kerchief, form the costume of the Beloochi fair. There were also the seyuds of the two families, holy men wearing green mantles and red beards, and acting as physicians and father confessors in one. With the assistance of these advisers the affair was arranged; and when the day came, the whole population of the country-side might have been seen crowding to a grove of tamarind-trees in the plains of Nowsharra. From all points of the compass the Beloochis came scudding along on their wild shelties, to which the rider presents a remarkable contrast. Small, meagre, and unkempt, but swift and hardy almost beyond belief, the horse looks unworthy of the large and muscular personage he bears, whose dark complexion, aquiline nose, large and expressive eyes, and long hair falling in bushy ringlets over his shoulders, appears to some to bespeak a Jewish origin. He wears an immense turban twisted round his head, and a short-waisted, tight-fitting body, and sleeves of white cloth, with a vast petticoat. This strange figure is armed to the teeth with sword, shield, matchlock, poniard, and other weapons, and loaded with belts, powder-flasks, ball-pouches, and numerous other military appendages, embroidered in coloured silk, and adorned with fringes and tassels. A numerous concourse of this kind must form a striking sight; but at present they are varied with groups of women in their out-of-door's mantle, covering them like a shroud from head to foot, and wayfaring seyuds and armed fakirs well mounted and equipped. The tamarind grove was already crowded with spectators, and the tom-tom or drum, cymbals, and guitar, were heard from the midst. A group of dancing-girls, the unending accompaniment of every spectacle in this part of the country, were close at hand, and numerous camels and horses picketted around filled up the picture.

The two combatants at length appeared, each with an escort of his clan; and besides being large and heavy men, appeared loaded with arms to an extent which threatened to impede their motions. But this is not the case, for there are no swordsmen in Asia more expert; and their weapons are so exquisitely keen, that a Beloochi will fling upon the air a leaf of tissue paper, and sever it in two before it reaches the ground. Such were the swords that were to decide the feud—but not on *terra firma*! Two lofty tamarind-trees that were within a slight distance of each other were selected, and a long thick rope was fastened to the upper branches of each, and the other end firmly knotted round the waists of the two combatants. They were then drawn up, each to his own tree, till their toes were four feet from the ground, and the ropes were then made fast. Thus they hung for a while, balancing their weight, adjusting their large shields, and trying their terrible swords upon the air, till the signal was given.

At that moment some assistants below, catching them by the feet, drew them back as far as they could

reach, and then gave them an impetus forward. Onward flew the warriors towards each other, and a crash and a clang told of their meeting. But the collision was only instantaneous; for having struck, they finished their swing, and then returned, back to back, but struggling desperately to whirl round, that they might either strike or defend themselves. And so this truly Terrific Combat went on, encouraged by the beating of the drum, the clash of the cymbals, the screaming of the women, the shouts of the men; and the aerial pace of the warriors accelerated by the furious pulls and pushes of their anxious clan. Their great shields served for some time for a defence; but as their motions became more irregular, from their own maddening efforts and the enthusiasm of their friends, their bodies were more frequently exposed to the blows, till their white garments were at length dyed with blood, which rained down in showers upon the heads of those below. It seems scarcely credible, but this singular duel actually lasted *three hours*; and it was only terminated by one of the combatants being thrown within the guard of the other, and entirely disabling him by a thrust through his right arm.

This decided the victory, as was instantly acknowledged by all parties; the chiefs were lowered to the ground, and clasped each other as friends to their bloody bosoms; and the tom-tom, the cymbals, the guitar, the dancing-girls, the fakirs, the Beloochi women, and the Beloochi men, celebrated the result with a prolonged noise which rang through the tamarind grove, and startled the lonely flock-keepers at the most distant boundaries of the plains of Nowsharra.

And what more, oh concoctors of the melodrama? Only this—for we do not relate a fiction, but a fact—that Buckree espoused a sister of Fungus, and that peace was restored in the two tribes. Down with the curtain!

ANECDOTES OF THE ARISTOCRACY.*

'The nobles and gentlemen of England, Ireland, and Scotland,' says Mr Burke in his preface to these anecdotes, 'have a capacity and chivalry of soul, and a daring spirit of adventure, which must make *some of them at least* heroes of marvellous transactions at every time, whether their course of life confines them to their stately mansions, and their unrivalled senate at home, or whether it leads them to foreign travel or to fields of war.' The qualifying words we have printed in italics cripple this peroration, but it is incurably lamed by what follows: 'and we submit that such is the case by the attestation of these volumes.' The volumes attest nothing more than what the rational reader would believe if the work had never seen the light at all, that in the aristocracy there are good and bad, mean and heroic, just as in other classes.

As a literary performance, we cannot say anything in praise of the work, and indeed the author seems rarely to have aimed at much more than a plain statement of facts. The exceptions are a few legends, in which preternatural machinery is introduced as originating real events; but in general the anecdote is given in a brief business-like manner, and frequently terminated in the style of a peerage, with the names, marriages, and deaths of the descendants. This adds in some cases to the value of the work, but does not render more readable a book of miscellaneous anecdotes, where the thread of interest is broken almost in every page, and where the readers of the *Lounger's* *Commonplace Book* and other similar collections will not find a great deal that is new and original.

With all these deductions, nevertheless, the book has its value, and may be dipped into from time to time with advantage, both by the genealogist and the mere seeker of amusement. To the latter of these readers

we shall offer some favourable specimens of the sort of entertainment he may expect.

It is repeated by everybody that 'truth is stranger than fiction;' but on perusing some of these pages we are more struck by the fact, that there is a sternness about truth which makes fiction shrink and wither. Who does not remember the story of that damsel of low degree who was wooed and won by an obscure stranger, and who, on being taken home to her future dwelling, found it a palace? This palace was Burleigh, the magnificent mansion of the Cecils; the mysterious bridegroom was the late Marquis of Exeter; and the astonished girl was a farmer's daughter, afterwards the mother of the present marquis. Poets and novelists have revelled in this charming story, and dwelt with sympathetic delight upon the bewilderment of the lovely bride subsiding into true and lasting happiness. But this is fiction adorning fact—for, alas! the romance had a very different termination. 'Her ladyship, unaccustomed to the exalted sphere in which she moved, chilled by its formalities, and depressed in her own esteem, survived a few years only her extraordinary elevation, and sank into an early grave—a memorable example of the insufficiency of rank and fortune to secure happiness.'

In skimming the first volume, we are arrested next by an incident of a different kind, occurring in the life of Lady Catherine Thynne, who was married to an old gentleman, Sir Walter Long of Drayton. When the old husband was on his deathbed, he exacted a solemn pledge from his young wife that she would remain faithful to his memory; but her ladyship forgot her obligation, and gave her hand eventually to Sir Edward Young. When the marriage procession returned from the church, and the new bridegroom was leading his lady into the parlour, the portrait of old Sir Walter Long, which hung above the door, fell suddenly down upon the shoulder of the bride, and cracked itself against the floor! 'This,' says Aubrey, 'made her ladyship reflect upon her promise, and drew some tears from her eyes.' It was indeed a capital hit of posthumous jealousy.

Here is another promise better kept. Mr Hastings, the legitimate heir of the earldom of Huntingdon, while residing with the earl as his domestic chaplain, 'became enamoured of a pretty chambermaid called Betsy Warner, then living in the family, and to her he promised solemnly that she should be his wife, as soon as he got possession of the living of Great and Little Leke. In the ebbs and flows of human life, and its shifting concerns, early acquaintances are soon separated and forgotten. Thirty years had elapsed. Mr Hastings, meantime, had married and lost his wife, and gained a second living—that of Great and Little Leke. One day the venerable old pastor was surprised by the appearance of a strange postchaise-and-four driving rapidly up the avenue to the parsonage-house. An elderly gentlewoman alighted from it, and Miss Warner was ushered into his venerable presence. After an interval of surprise and recognition, she proceeded to tell him "that she had come to claim the fulfilment of his promise; that he had long since made the acquisition of fortune on which his obligation of performance depended; and that on her part she had never, by the slightest indiscretion, swerved from an engagement which she considered sacred from the first moment." The result was, that the reverend gentleman having duly satisfied himself by diligent inquiry concerning his betrothed's conduct and character, which was found to have been strictly correct, the bans were formally announced in the church by himself, and the parties married accordingly.' The old gentleman was not ambitious. He assumed the title of earl for a while; but disliking litigation, he gave himself no trouble about it, being loth, as he said himself, to make his wife Betsy Countess of Huntingdon.

Mr Burke tells in a few sentences the story of Lady Drogheda and Wycherly the dramatist, already familiar,

* B. J. Bernard Burke, Esq. 2 vols. London: Colburn. 1849.

we presume, to many of our readers. The Countess of Drogheda—a young, rich, and beautiful widow, eldest daughter of the Earl of Radnor, Lord-Lieutenant of Ireland—was one day, in the year 1679, in a bookseller's shop at Tunbridge inquiring for the 'Plain Dealer.' The author happened to be present, and the bookseller good-naturedly presented him to her ladyship as the real Plain Dealer. This casual meeting led to an acquaintance, and soon after the poet and the countess were married. The poor lady died soon after her marriage, settling her whole property upon Wycherly; but the will was litigated, and the extravagance of the dramatist landed him in prison, where he lay for several years. When in his eightieth year, however, and just eleven days before his death, he married another young woman with a fortune of L.1500. A considerable portion of this he contrived to spend, leaving her with the remainder the very judicious advice, 'not to take an old man for her second husband.'

It has not been a very uncommon thing, it appears, for lady-aristocrats to marry beneath their rank. Frances, a daughter of Viscount Bindon, 'descended so low as to marry one Prannel, a vintner's son in London.' The husband died, and left her a young, beautiful, and rich widow. She thereupon encouraged the addresses of Sir George Rodney; but on the appearance of the Earl of Hertford in the field, she jilted Sir George, and married the peer. The deserted lover followed the earl and countess to Amesbury, where, after sending her some despairing verses written in his own blood, he fell upon his sword, and slew himself. After the earl's decease, she might have been Duchess of Lennox; but the fair heroine's success had opened out such vast prospects for her ambition, that she could be satisfied with nothing less than royalty, and actually spread her nets to catch the king. The king, however, would not be caught, and she died Countess of Hertford in 1639. An amusing anecdote of her is given by an old writer:—

'When she was Countess of Hertford, and found admirers about her, she would often discourse of her two grandfathers, the Dukes of Norfolk and Buckingham; recounting the time since one of her grandfathers did this, the other did that: but if the earl her husband came in presence, she would quickly desist; for when he found her in these exaltations, to take her down he would say, "Frank, Frank, how long is it since thou wert married to Prannel?" which would damp the wings of her spirit, and make her look after her feet, as well as gaudy plumes.'

A more interesting heroine is Mary, Countess of Orkney. This lady was deaf and dumb, and was married in 1753 by signs to her cousin, the first Marquis of Thomond. Soon after the birth of her first child, the nurse, who seems to have watched with curiosity, and not without suspicion, the proceedings of 'a dumbie,' saw the young mother creep cautiously towards the cradle of her child, as if her brain was busy with some deep design. Presently she took a large stone from under her shawl, and raised it up in both hands. The woman, who had expected nothing so dreadful as this, was paralysed with horror. She could not move—she could not scream; and the next instant down came the stone. It fell on the floor, however, not on the cradle; and when the child started, and awoke screaming, the countess fell on her knees in a transport of joy, her experiment having proved that her infant possessed the sense which was wanting in herself.

Let us instance one more lady, and then turn from the fascinations of the sex. Elizabeth Spencer, wife of Lord Compton, afterwards Earl of Northampton, was the greatest heiress of the time of James I. Her father was Sir John Spencer, lord-mayor of London, who left a fortune estimated at from L.300,000 to L.800,000—an almost boundless treasure in those days. On the inheritance falling to him through his wife, Lord Compton went out of his wits for joy; but recovering after a time, he received the following letter from her ladyship, which is given as affording a pretty complete, though

perhaps exaggerated, picture of the woman of fashion and fortune of that day:—

'MY SWEET LIFE—Now I have declared to you my mind for the settling of your state, I suppose that it were best for me to bethink and consider within myself what allowance were meetest for me. . . . I pray and beseech you to grant to me, your most kind and loving wife, the sum of L.2600 quarterly to be paid. Also I would, besides that allowance, have L.600 quarterly to be paid, for the performance of charitable works; and those things I would not, neither will be accountable for. Also, I will have three horses for my own saddle, that none shall dare to lend or borrow; none lend but I, none borrow but you. Also, I would have two gentlewomen, lest one should be sick, or have some other let. Also, believe it, it is an unbecoming thing for a gentleman to stand mumping alone, when God hath blessed their lord and lady with a great estate. Also, when I ride a-hunting, or a-hawking, or travel from one house to another, I will have them attending; so, for either of those said women, I must and will have for either of them a horse. Also, I will have six or eight gentlemen; and I will have my two coaches, one lined with velvet to myself, with four very fair horses; and a coach for my women, lined with cloth, and laced with gold, otherwise with scarlet, and laced with silver, with four good horses. Also, I will have two coachmen, one for my own coach, the other for my women. Also, at any time when I travel, I will be allowed not only carriages and spare horses for me and my women, but I will have such carriages as shall be fitting for all, orderly, not pestering my things with my women's, nor theirs with either chambermaids, nor theirs with washmaids. Also, for laundresses, when I travel, I will have them sent away before with the carriages, to see all safe. And the chambermaids I will have go before, that the chamber may be ready, sweet, and clean. Also, for that it is unbecoming to crowd up myself with my gentleman-usher in my coach, I will have him to have a convenient horse to attend me, either in city or country. And I must have two footmen. My desire is, that you defray all the charges for me. And for myself, besides my yearly allowance, I would have twenty gowns of apparel, six of them excellent good ones, eight of them for the country, and six other of them very excellent good ones. Also, I would have to put in my purse L.2000, and L.200, and so you to pay my debts. Also, I would have L.6000 to buy me jewels, and L.4000 to buy me a pearl chain. Now, seeing I have been, and am, so reasonable unto you, I pray you do find my children apparel, and their schooling, and all my servants, men and women, their wages. Also, I will have all my houses furnished, and my lodging-chambers to be suited with all such furniture as is fit—as beds, stools, chairs, suitable cushions, carpets, silver warming-pans, cupboards of plate, fair hangings, and such-like. So for my drawing-chamber in all houses, I will have them delicately furnished, both with hangings, couch, canopy, glass, carpet, chairs, cushions, and all things thereunto belonging. Also, my desire is, that you would pay your debts, build up Ashby House, and purchase lands, and lend no money, as you love God, to my lord-chamberlain, who would have all, perhaps your life, from you. . . . So, now that I have declared to you what I would have, and what it is that I would not have, I pray you, when you be an earl, to allow me L.2000 more than I now desire, and double attendance.'

An old English squire of the same reign is equally interesting. Mr Hastings was of high rank and good estate in Dorsetshire; but he built himself a lodge in the New Forest, Hampshire, and shut himself up there for life with his horses and dogs. 'He had enclosed with his own labour a vast paddock, which he called his park, and which he kept well stocked with deer and rabbits, with fish-ponds of his own making. He had also contrived a narrow bowling-green behind this enclosure, where he played by himself, chalking up for parties, as if he had any. In the same place he had

also a banqueting-room, built like a booth in a fair, where he entertained some of the poaching peasantry; for although he was a ranger, he was reasonable, and if they made him presents, he took no more notice.' His best room was full of the implements and spoils of the chase; and his bedroom and parlour were lumbered with numerous litters of kittens and puppies. His talk was of the genealogy of cats and dogs, of hawks' bills, rings, and birds' eggs, which last he kept in great numbers in the crowns of hats. After the example of his patron and master, King James I., he devoted a room in his house to devotion—that is to say, to a pulpit and desk, the only use of which he made was as a safe deposit for salted meats and seasoned pies. 'The troubles of the times disturbed him not; for he had forgotten the king, and the court had forgotten him;' and at length, in 1650, he died peacefully at the age of ninety-nine.

The following amusing anecdote is told of the late Earl of Dudley's habit of thinking aloud:—'Lord Dudley had been invited to the house of a friend, upon the occasion of some great fête, but being a man of early habits, had ordered his carriage at a certain hour, having some miles to travel before he could obtain his accustomed repose. To his great mortification, after repeated inquiries for Lord Dudley's carriage, it had not arrived, and his lordship, as well as others, imagined that some accident must have happened to it. One of the guests, seeing how much his lordship was disconcerted by the event, very politely offered him a seat in his. The gentleman in question had to pass his lordship's house on his return home, and though he was almost a stranger to Lord Dudley, his rank and position in the county were of course well known to him, and the civility was no more than one gentleman would, under similar circumstances, have offered to another. Nevertheless, they had not been seated in the carriage more than twenty minutes, when the peer, who, being tired, had up to that moment maintained a most perfect silence, observed, in a low, but distinctly-audible tone of voice—"I'm very sorry I accepted his offer. I don't know the man. It was civil, certainly; but the worst is, I suppose I must ask him to dinner. It's a deuce of a bore!" He then relapsed into his former state of taciturnity, when, after a few minutes, the gentleman, pretending to be afflicted with the same failing, and imitating his lordship's tone, observed, "Perhaps he'll think I did it to make his acquaintance. Why, I would have done the same to any farmer on his estate. I hope he won't think it necessary to ask me to dinner; for I sha'n't accept his invitation!" Lord Dudley listened to him with earnest interest, immediately comprehended the joke which he had himself provoked, offered his hand with much hearty good-will to his companion, making every proper apology for his involuntary rudeness, and from that night the travellers became inseparable friends.'

SYSTEM OF EDUCATION IN AMERICA.

THE following succinct account of the educational system in America was given at the November soirée of the Lancashire School Association by Mr Walter Ferguson:—

A feature which strikes every visitor is the general intelligence of the Americans. Except in one or two of the largest cities, and that chiefly among the imported population, there is no class to be found answering to our masses of unskilled labourers in town and country, whose wants and enjoyments are for the most part those of the lower animals, and their power to contribute to the wellbeing of themselves, their families, and the state, little differing in kind or degree from that of brutes or machines. The degree of elevation of the mass of the populace above this level varies in different states in remarkable proportion to the quantity and quality of popular education—according as the common schools of the state are best and most extensive, and have been so the longest time. The states may be classed, in an educational point of view, in three divisions. The first comprises New England and New York; the second, the far states of the west; and the third, the slave states of the south and south-west. Pennsylvania

and New Jersey, geographically speaking, would belong to the first division, but their educational status is scarcely such as to entitle them to a place in it.

The five old New England States, Massachusetts, Connecticut, Rhode Island, New Hampshire, and Vermont, are by far the most interesting portion of the new world; and it is questionable if in either hemisphere a community of equal size can be found which exhibits such a model of moral and physical wellbeing as the commonwealth of Massachusetts. These states are a striking instance of the vast preponderance of moral over physical elements in the prosperity of states. In spite of the disadvantages of soil and climate under which its people labour, they are better off and happier, and their prosperity rests on a surer foundation, than that of the states more favoured by nature. The New England States, with New York which adjoins them, are about the twelfth of the surface of the Union, but contain one-fourth of its population, and probably much more than half its wealth. This is the part of the country in which popular education is most widely diffused, and of the best quality. Each state has its own system: that of Massachusetts, which has afforded a model to the other New England States, and which has been recently adopted by the state of New York, with some important modifications, is the most celebrated. It is the fruit of a series of enactments extending from the middle of the seventeenth century to the present day. Connecticut passed a law for the establishment of schools in 1650, and the other New England States provided at various times for the universal instruction of their youth, in what still stands in the statute book of Massachusetts as the minimum of teaching in her schools—namely, 'Reading, writing, English grammar, geography, arithmetic, and good behaviour.' Previously to the year 1847, there had been no medium of communication between the different common schools of the state, but each was supported by its own district, and followed its own system of education, the legislature interfering no further than to exact the penalties for neglect of the school laws. In that year, however, a Board of Education was appointed, to which Mr Horace Mann was nominated secretary, to collect and diffuse information, and to devise and recommend improvements. It was clothed with no power but that of enforcing returns, its functions being to act on the local school committees by persuasion alone, and to lead them to improvement by the light which its yearly reports afforded them on the subject.

The Massachusetts system, as it at present subsists, may be thus described:—Its means are derived from local taxes, aided by a school fund, dispensed by the state. This fund arises from old sales of state property, and claims for military service, &c. allowed to the state by the United States government. It amounts at present to 750,000 dollars, and its increase is limited to a million. But the chief support of the schools is from local taxes, which are raised by every town as, and along with, its municipal taxes for general purposes. The expenses may be thus divided:—1st, The parent provides books, stationery, &c.; 2d, The district provides school-houses, furniture, and apparatus; 3d, The town provides salaries of teachers; and for this purpose, and providing fuel, must raise a tax of at least 1½ dollar for every child in the town between the ages of four and sixteen. Towns, according to their population, must maintain schools of different grades, and for longer or shorter portions of the year, provided that each town raise not less than the above amount for each child, to be expended as above. School districts, or territorial subdivisions of the towns, when formed by the towns, and authorised by a vote of the town for this purpose, may elect their own district officers, raise money for building and repairing school-houses, and providing apparatus and libraries. Every inhabitant who has any voice in public affairs is recognised in the administration and benefits of the system. Every child, white or coloured, is entitled, as a right, to all the privileges of the schools and library of the district. The executive of the system comprises three grades of officers, which, beginning with the lowest, are—1st, The Prudential Committee for districts; 2d, The Town School Committee for towns; and 3d, The Board of Education for the state.—1st, The Prudential Committee consists of one member for each district, when the town is divided into districts. They are chosen by the legal voters of the town, or by those of the district, as the town may decide. Each member superintends a district, of which he must be a resident. His business is to engage

the teacher, to provide fuel, see that the school-house is in good repair, and attend generally to such matters of management as the Town Committee may depute to him; 2d, The Town School Committee, which may consist of three, five, or seven persons, is chosen annually to superintend all the schools of the town: its functions are the apportioning of school money among the schools or districts; examining and licensing teachers; monthly visitation of the schools; regulation of text-books; and presentation of a written report annually to the town, respecting their own proceedings, and the condition and improvement of the schools: a copy of this document must be forwarded to the secretary of state of the commonwealth, which he refers to the Board of Education, as part of the returns which, as above-described, that Board is empowered to collect; 3d, The Board, which is the head of the system, consists of the governor and lieutenant-governor of the commonwealth, *ex-officio*, and eight persons appointed by the governor and council. They appoint their own secretary, who receives a salary of 1500 dollars, and the members are reimbursed their expenses.

In 1845, the amount raised by tax in the different towns ranged from the legal minimum of 1½ dollar for each child, to 7 dollars 64 cents. Boston, the capital, stands third on the list; it raised 124,968 dollars, or about L25,000, being at the rate of 6½ dollars for each child. The amount expended by the whole state in the same year was about L170,000, of which L115,000 was raised by tax. The average time of the schools being in operation was 7½ months. The aggregate of scholars of all ages was 149,189 in summer, and 169,977 in winter, or about 2 in every 9 of the whole population. These children were taught by 2523 male teachers, assisted by about twice as many females, who are almost universally employed in America to teach the girls and younger boys. The report for 1845 complains much of irregular attendance, as shown by the marked difference of numbers in summer and in winter; and it appears from a closer calculation, founded on the full population returns of the state, and the admirable school statistics published by the Board of Education, that, allowing for the members attending private schools, about 1 in 3 of all the children in the state, who ought to be found in the public schools, was permanently absent from them. This, and other evils which the light thrown on the subject by the operations of the Board enables the public to detect, have since been met by prompt remedial measures, which, I believe, have much abated, and promise to remove them.

The average of salaries paid to male teachers was L77 a year. To the female assistants, L30. When I mention that the city of Boston pays its head-masters salaries of L300, and some as much as L400, it must be obvious that some of the country teachers must be very inadequately remunerated. The Board is turning its attention to the remedy of this important evil. After referring to the systems of education established in Connecticut and Rhode Island, Mr Ferguson said that the school system of the state of New York dated only from 1812, and its present development was the fruit of recent legislation. It is for the most part modelled on that of the New England States, but with important modifications. It is made a separate department of the state, and has at its head a state superintendent. There are also superintendents of counties and of towns elected by the people. Its financial system includes contributions from a state fund of half a million sterling proportioned to local exertion; and it differs from the systems of New England in deriving a part of its support from a rate levied on the parents of the pupils, but assessed from the district at large in cases of poverty. It provides the most approved normal-school education for its teachers; and has in every district a district library, containing already upwards of a million of volumes, which are free to all the children of the state. Of the schools of New York city, which cost annually about L50,000, I can say, from personal observation, that they are in all respects most creditable. Its inhabitants wisely remunerate their teachers so liberally, that private schools cannot compete with them, and are being abandoned by their best teachers. Even stationery and books are furnished by the city, and children of all classes may be found side by side on their benches. I never saw children anywhere who appeared to be better taught. A free college has also been established to receive such pupils from the common schools as may earn that privilege by their proficiency, at which they may be carried, at the

public expense, through the gradations of a complete university education.

Of the western states it is difficult to indicate anything; for what is true of those wonderful countries to-day, is false to-morrow. Ohio has established a system of common schools which is said to be efficient. That of Michigan appears to be inferior to few of the eastern systems in its arrangements and results. The nucleus of a general fund has been provided by the general government for all the western states, by setting aside a thirty-sixth part of the land in each for the support of schools.

The state of education in the slave states appears from a return of the number of white males in each state above twenty-one years of age who could not read and write, taken from the census of 1840, to have been at that time generally backward as compared with the western states, and greatly behind that of the first group. Connecticut occupies the highest place in the return; North Carolina the lowest. He did not, however, place much confidence in the accuracy of this document. The educational aspect of the United States is, on the whole, cheering to the philanthropist. The evil influences which have been, and which are at work in that great country, and which make her enemies jeer, and her friends blush, are rife in the least-educated parts of the country, and will no doubt be altogether obliterated by education.

RIGHT OF LABOUR.

On the question now agitated, whether the state ought to provide labour for all claiming to be employed, the following remarkably sound and practical speech was lately made before the French National Assembly by Marius André, an operative, and deputy of the Var:—

'Citizen Representatives—However great may be the talents of those who appear on this tribune—however eloquent their words—they can only give you their individual opinion on the questions which are before the Assembly. I have no eloquence to bring you; but allow me, at least, to offer you my opinion. Labour is the subject of debate, and perhaps you will be glad to have on that subject the opinion of a working-man. Citizens, I think the Republic ought *not* to allow the providing of labour to be imposed on it as a duty; for in doing so she will create for herself an immense and permanent danger; since the working-men all over France would leave their present employments on the slightest pretext; either from insufficiency of wages, or from pure conceit, and crowd into Paris, or at least into the principal manufacturing towns, which already overflow with operatives. Suppose an operative to be dissatisfied with his master, or suppose he thinks himself not properly appreciated: "Very well," says he, "I will go and find work elsewhere—the country owes me work, and therefore it *must* give me work;" and so he sets off for Paris. What will the Republic do with all these operatives thus flocking to the capital? Will it give every one of them the labour of his trade? Will it give the shoemaker shoes to make? Will it give the watchmaker watches to make? No; it will give them all spade-work—that is, a pretext for doing nothing. It will make these men lose the taste for real work; and when the taste is once gone, it never comes back again. If you want an example of the fatal effects which the right to have work provided for them has already had on the operative population, listen to this: An employer in Paris had eighty operatives at work when the national workshops were first opened; and his men were earning, on an average, four francs a day (this is equal in value to five shillings a day in England for a poor man). When the national workshops were opened, the greater part of these operatives left their master's work: for what advantage? you will ask me. To earn in the national workshops just half what they earned with their master! I am aware that in this number one-half were driven to it by the threats of the other half; but at all events it is a fact, that of eighty workmen wanted at that very time by the master, and to whom he was willing to pay four francs a day, eight only resisted the intimidation, and were obliged to shut themselves up, that they might work without being persecuted. The rest, or at least the leaders, preferred earning two francs a day for doing *nothing*, to getting four by *working industriously*. It may be an unpleasant thing to say, but I repeat it, the taste for labour is much sooner lost than acquired; and it is for that very reason that it has pleased Providence to cherish that taste in us by a feeling of necessity: it is necessity that makes the good workman,

just as it is good conduct which makes him successful. If I declare myself against the right in question, I do so, gentlemen, as a question of prudence, and not because I do not sympathise with the operatives. I ought not to be obliged to remind you of it, but I believe I speak, if not in the name of the operatives in general, at least in the name of a very large number of them; for the majority of those who have chosen me from among their number to be their deputy, think just as I do. As for the state having a duty imposed upon it by nature to find work for operatives, as far as its power extends, and even to make some extraordinary exertions when the circumstances are extraordinary, there can be no doubt of that; but between saying this, and saying that the operatives have a right to exact labour from the state, there's an absolute gulf. What a number of things a father thinks it his duty to do for his children! yet the children ought not to claim these things of their father as a right. You will tell me that nature has infused into the hearts of parents sentiments which induce them to perform these duties almost unconsciously; well, what nature could not put into the hearts of employers, is supplied in another way, by making it their interest. There is no sort of comparison between the work which is done by the operatives who love and esteem their master, and what is done by those who have cause to feel differently towards him. I am in the same way of opinion that it is an imperious duty in the state to give food to its children; but at the same time I am bound to observe that the exercise of this duty, which can still less be contested than the duty of giving work, would, nevertheless, lead to very unpleasant consequences if you proclaimed it as a right. In the quarter where I live, when they began to make a list of those who were in want, the number first announced was 40; in a few days it was found there were 72; and soon after, when a third list was made, there were 111. God forbid that I should seem to be bringing forward an argument here for refusing succour to those who are *really* in want! No; I merely desired to show to what an extent the state was committing itself when, instead of confining itself to assisting those who were *absolutely* in want, it gave them the right to *exact* this assistance. Gentlemen, I think I may confine myself to these few words: if I were at the head of a shop or manufactory, I should give you the same reasons for my opinion; but then you might fairly consider them as interested reasons. Well, then, I who am speaking to you am no master: I am myself an operative, who have passed all my life in labour, and I come to tell you that *those who seek for labour in good earnest, hardly ever fail of obtaining it*. When that does happen, and not before, then it is the duty of the state to interfere; and in such a case it is too much the interest of the state to do so, for any one to suppose that it will fail in its duty. It is with the labour of my own hands that I have obtained the means of educating my family respectably; I have therefore a right to speak as I do; and I declare that on every occasion, if I have had a comrade who was industrious and economical, I have never found that he wanted work more than myself. I shall vote, therefore, against operatives having the power of exacting labour from the state as a right.

PROGRESS OF TEMPERANCE IN LONDON.

Let us pause to indicate the movement of temperance by comparing the proportion of publicans to sinners against sobriety in former days and now. 'About a century ago,' said Dr Colquhoun before the police committee of 1816, 'multitudes of men and women were constantly seen rolling about the streets drunk; and it was not uncommon to behold such an enticement painted under a public-house sign as this: 'You may here get drunk for a penny, dead drunk for twopence, and have clean straw for nothing!'' The crime became so general, that the legislature determined to lessen it by making its commission more costly and difficult, and levied a duty of 20s. per gallon on spirits, and prohibited their sale by retail. The result was, that quite as much was drunk as before; for within two years, 12,000 persons were convicted under the act within the bills of mortality of selling gin clandestinely. At that time the population of London may have been about 680,000; so that the generality of drunkenness in London at that time may be estimated by the fact, that during two years, the proportion of convictions for merely selling gin illegally to the amount of the population was nearly 1 in 60; but of course many persons were each convicted many times. The decrease of the vice was not rapid; for we find that

in 1785, to a population of about 800,000, there were in London 7180 houses at which beer and spirits were sold—namely, 5975 alehouses, 207 inns, 447 taverns, and 551 coffee-houses—or a proportion of 1 public-house to nearly 112 individuals. The comparison becomes more gratifying as we approach the present year. In 1840 there were about 1,873,000 individuals; and according to Pig-gott's Directory for that year, 5840 persons, exclusive of wine-merchants, dealt in strong drinks, of whom there was therefore 1 to nearly every 321 Londoners. The present year shines more brightly in this respect than any of its predecessors. In 1849 a London population of perhaps 2,250,000 gives encouragement to no more than 5017 purveyors of beer and spirituous liquors, exclusive of bottled-ale and wine-merchants, or a proportion of 1 publican to about every 450 individuals. We recommend these facts to the especial attention of temperance societies, and trust they will afford encouragement for renewed exertion in the excellent cause.—*Daily News*.

THE CHANGE-SEEKER.

BY CALDER CAMPBELL.

Who to unknown lands would wander,
Having health and hope at home?
From the spot where he abideth
Wherefore should the happy roam?
Love—like ivy to the ruin—
Clingeth where it hath been bred;
Peace of mind forbids ambition
With its schemes to vex the head.

'Tis the spirit, disappointed
In its wayward hopes and cares,
That for novel pleasures seeketh
Foreign shores and new—despairs;
Meeting, 'neath the alien sunshine,
For the treasures missed at home,
Pangs that fret the weary body,
Joys that go, and griefs that come.

'Give me change!' the morbid spirit
Callecth, with a voice that tells
How its inner sense hath suffered
From the world's pernicious spells:
'Give me changes, give me chances,
Friendships new, and new desires;
I would blot from memory's pages
Thoughts that scorch like fever's fires.

'For the fields where roved my childhood,
Give me scenes that have no look
Of the garden, or the wild wood
Where I studied first Love's book.
Fell each tree that 'mid those forests
Gave me shelter from the sun;
In their stead plant stronger foliage,
'Neath whose shade new rivers run!'

So he says—the disappointed—
Tired and fretted, soured and palled;
Wishing still for alterations,
Finding fears that come uncalled.
Those who have no wish to wander
(Lapped in ease, and rich in health)
Look with wonder at the longings
That can ne'er be quenched by wealth.

There is sorrow in the knowledge
That the gayest heart may find,
Ere the head hath gathered snow-drift,
Fresh desires to haunt the mind;
But the Loved, the Loving, Healthy,
Hold alone Content's true gem;
What they know, and what they live in,
That is all the world to them.

REDUNDANCY OF WORDS.

The excess to which the unchecked use of redundancy tends may be imagined from what the Arabian authors tell us, as a boast, of their tongue. The lexicographer Mohammedes Al-Firanzabadius reckoned above fourscore names for *honey*, and 1000 for a *sword*; and Ebn Khalawih composed one volume on the 200 words expressing *serpent*, and another on the 500 signifying a *lion*.—*Quarterly Review*.

EXPERIENCES OF A BARRISTER.

THE CONTESTED MARRIAGE.

I HAD just escaped to my chambers one winter afternoon from a heavy trial 'at bar' in the King's Bench, Westminster, and was poring over a case upon which an 'opinion' was urgently solicited, when my clerk entered with a letter which he had been requested to deliver by a lady, who had called twice before during the day for the purpose of seeing me. Vexed at the interruption, I almost snatched the letter from the man's hand, hastily broke the seal, and to my great surprise found it was from my excellent old friend Sir Jasper Thornely of Thornely Hall, Lancashire. It ran as follows:—

'MY DEAR —, The bearer of this note is a lady whom I am desirous of serving to the utmost extent of my ability. That she is really the widow she represents herself to be, and her son consequently heir to the magnificent estates now in possession of the Emsdales—you remember how they tripped up my heels at the last election for the borough of —!—I have no moral doubt whatever; but whether her claim can be legally established is another affair. She will tell you the story herself. It was a heartless business; but Sir Harry, who, you have no doubt heard, broke his neck in a steeplechase about ten months ago, was a sad wild dog. My advice is, to look out for a sharp, clever, persevering attorney, and set him upon a hunt for evidence. If he succeed, I undertake to pay him a thousand pounds over and above his legal costs. He'll nose it out for that, I should think!—Yours truly,

JASPER THORNELY.

'P. S.—Emsdale's son, I have just heard—confound their impudence!—intends, upon the strength of this accession of property, to stand for the county against my old friend —, at the dissolution, which cannot now be far off. If you don't think one thousand pounds enough, I'll double it. A cruelly, ill-used lady! and as to her son, he's the very image of the late Sir Harry Compton. In haste—J. T. I reopen the letter to enclose a cheque for a hundred pounds, which you will pay the attorney on account. They'll die hard, you may be sure. If it could come off next assizes, we should spoil them for the county—J. T.'

'Assizes'—'county'—'Sir Harry Compton,' I involuntarily murmured, as I finished the perusal of my old friend's incoherent epistle. 'What on earth can the eccentric old foxhunter mean?' 'Show the lady in,' I added in a louder tone to the clerk. She presently appeared, accompanied by a remarkably handsome boy about six years of age, both attired in deep mourning. The lady approached with a timid, furtive step and glance, as if she were entering the den of some grim ogre, rather than the quiet study of a civilised lawyer of mature age.

I was at once struck by her singular and touching loveliness. I have never seen a woman that so completely realised the highest *Madona* type of youthful, matronly beauty—its starlight radiance and mild serenity of sorrow. Her voice, too, gentle and low, had a tone of patient sadness in it strangely affecting. She was evidently a person, if not of high birth, of refined manners and cultivated mind; and I soon ceased to wonder at warm-hearted old Sir Jasper's enthusiasm in her cause. Habitually, however, on my guard against first impressions, I courteously, but coldly, invited her first to a seat, and next to a more intelligible relation of her business with me than could be gathered from the letter of which she was the bearer. She complied, and I was soon in possession of the following facts and fancies:—

Violet Dalston and her sister Emily had lived for several years in close and somewhat straitened retirement with their father, Captain Dalston, at Rock Cottage, on the outskirts of a village about six miles distant from Leeds, when Captain Dalston, who was an enthusiastic angler, introduced to his home a gentleman about twenty-five years of age, of handsome exterior and gentlemanly manners, with whom congeniality of tastes and pursuits had made him acquainted. This stranger was introduced to Violet (my interesting client) and her sister, as a Mr Henry Grainger, the son of a London merchant. The object of his wanderings through the English counties was, he said, to recruit his health, which had become affected by too close application to business, and to gratify his taste for angling, sketching, and so on. He became a frequent visitor; and the result, after the lapse of about three months, was a proposal for the hand of Violet. His father allowed him, he stated, five hundred pounds per annum; but in order not to mortally offend the old gentleman, who was determined, if his son married at all, it should be either to rank or riches, it would be necessary to conceal the marriage till after his death. This commonplace story had been, it appeared, implicitly credited by Captain Dalston; and Violet Dalston and Henry Grainger were united in holy wedlock—not at the village church near where Captain Dalston resided, but in one of the Leeds churches. The witnesses were the bride's father and sister, and a Mr Bilston, a neighbour. This marriage had taken place rather more than seven years since, and its sole fruit was the fine-looking boy who accompanied his mother to my office. Mr Grainger, soon after the marriage, persuaded the Dalstons to leave Rock Cottage, and take up their abode in a picturesque village in Cumberland, where he had purchased a small house, with some garden and ornamental grounds attached.

Five years rolled away—not, as I could discern, too happily—when the very frequent absences of Violet's husband in London, as he alleged (all her letters to him were directed to the post-office, St Martin's le Grand—

till called for), were suddenly greatly prolonged; and on his return home, after an absence of more than three months, he abruptly informed the family that the affairs of his father, who was dying, had been found to be greatly embarrassed, and that nothing was left for him and them but emigration to America, with such means as might be saved from the wreck of the elder Grainger's property. After much lamentation and opposition on the part of Emily Dalston and her father, it was finally conceded as Violet's husband wished; and the emigration was to have taken place in the following spring, Henry Grainger to follow them the instant he could wind up his father's affairs. About three months before their intended departure—this very time twelve-month, as nearly as may be—Captain Dalston was suddenly called to London, to close the eyes of an only sister. This sad duty fulfilled, he was about to return, when, passing towards dusk down St James Street, he saw Henry Grainger, habited in a remarkable sporting-dress, standing with several other gentlemen at the door of one of the club-houses. Hastening across the street to accost him, he was arrested for a minute or so by a line of carriages which turned sharply out of Piccadilly; and when he *did* reach the other side, young Mr Grainger and his companions had vanished. He inquired of the porter, and was assured that no Mr Grainger, senior or junior, was known there. Persisting that he had seen him standing within the doorway, and describing his dress, the man with an insolent laugh exclaimed that the gentleman who wore that dress was the famous sporting baronet, Sir Harry Compton!

Bewildered, and suspecting he hardly knew what, Captain Dalston, in defiance of young Grainger's oft-iterated injunctions, determined to call at his father's residence, which he had always understood to be in Leadenhall Street. No such name was, however, known there; and an examination, to which he was advised, of the 'Commercial Directory' failed to discover the whereabouts of the pretended London merchant. Heart-sick and spirit-wearied, Captain Dalston returned home only to die. A violent cold, caught by imprudently riding in such bitter weather as it then was, on the outside of the coach, aggravated by distress of mind, brought his already enfeebled frame to the grave in less than two months after his arrival in Cumberland. He left his daughters utterly unprovided for, except by the legal claim which the eldest possessed on a man who, he feared, would turn out to be a worthless impostor. The penalty he paid for consenting to so imprudent a marriage was indeed a heavy and bitter one. Months passed away, and still no tidings of Violet's husband reached the sisters' sad and solitary home. At length, stimulated by apprehensions of approaching destitution—whose foot was already on the threshold—and desirous of gratifying a whim of Emily's, Violet consented to visit the neighbourhood of Compton Castle (the seat, her sister had ascertained, of the 'celebrated sporting baronet,' as the porter called him) on their way to London, where they had relatives who, though not rich, might possibly be able to assist them in obtaining some decent means of maintenance. They alighted at the 'Compton Arms,' and the first object which met the astonished gaze of the sisters as they entered the principal sitting-room of the inn was a full-length portrait of Violet's husband, in the exact sporting-dress described to them by their father. An ivory tablet attached to the lower part of the frame informed the gazer that the picture was a copy, by permission, of the celebrated portrait by Sir

Thomas Lawrence, of Sir Harry Compton, Baronet. They were confounded, overwhelmed, bewildered. Sir Harry, they found, had been killed about eight months previously in a steeple-chase; and the castle and estates had passed, in default of direct issue, to a distant relative, Lord Emsdale. Their story was soon bruited about; and, in the opinion of many persons, was confirmed beyond reasonable question by the extraordinary likeness they saw or fancied between Violet's son and the deceased baronet. Amongst others, Sir Jasper Thornely was a firm believer in the identity of Henry Grainger and Sir Harry Compton; but unfortunately, beyond the assertion of the sisters that the portrait of Sir Harry was young Grainger's portrait, the real or imaginary likeness of the child to his reputed father, and some score of letters addressed to Violet by her husband, which Sir Jasper persisted were in Sir Harry's handwriting, though few others did (the hand, I saw at a glance, was a disguised one), not one tittle of evidence had he been able to procure for love or money. As a last resource, he had consigned the case to me, and the vulpine sagacity of a London attorney.

I suppose my countenance must be what is called a 'speaking' one, for I had made no reply in words to this statement of a case upon which I and a 'London attorney' were to ground measures for wresting a magnificent estate from the clutch of a powerful nobleman, and by 'next assizes' too—when the lady's beautiful eyes filled with tears, and turning to her child, she murmured in that gentle, agitating voice of hers, 'My poor boy!' The words I was about to utter died on my tongue, and I remained silent for several minutes. After all, thought I, this lady is evidently sincere in her expressed conviction that Sir Harry Compton was her husband. If her surmise be correct, evidence of the truth may perhaps be obtained by a keen search for it; and since Sir Jasper guarantees the expenses—I rang the bell. 'Step over to Cursitor Street,' said I to the clerk as soon as he entered; 'and if Mr Ferret is within, ask him to step over immediately.' Ferret was just the man for such a commission. Indefatigable, resolute, sharp-witted, and of a ceaseless, remorseless activity, a secret or a fact had need be very profoundly hidden for him not to reach and fish it up. I have heard solemn doubts expressed by attorneys opposed to him as to whether he ever really and truly slept at all—that is, a genuine Christian sleep, as distinguished from a merely canine one, with one eye always half open. Mr Ferret had been for many years Mr Simpkins' managing clerk; but ambition, and the increasing requirements of a considerable number of young Ferrets, determined him on commencing business on his own account; and about six months previous to the period of which I am now writing, a brass door-plate in Cursitor Street, Chancery Lane, informed the public that Samuel Ferret, Esq., Attorney-at-Law, might be consulted within.

Mr Samuel Ferret was fortunately at home; and after a very brief interval, made his appearance, entering with a short professional bow to me, and a very profound one to the lady, in whom his quick gray eye seemed intuitively to espy a client. As soon as he was seated, I handed him Sir Jasper's letter. He perused it carefully three times, examined the seal attentively, and handed it back with—'An excellent letter as far as it goes, and very much to the point. You intend, I suppose, that I should undertake this little affair?'

'Yes, if, after hearing the lady's case, you feel disposed to venture upon it.'

Mr Samuel Ferret's note-book was out in an instant; and the lady, uninterrupted by a syllable from him, retold her story.

'Good, very good, as far as it goes,' remarked undismayed Samuel Ferret when she concluded; 'only it can scarcely be said to go very far. Moral presumption, which, in our courts unfortunately, isn't worth a groat. Never mind. *Magna est veritas*, and so on. When, madam, did you say Sir Harry—Mr Grainger—first began to urge emigration?'

'Between two and three years ago.'

'Have the goodness, if you please, to hand me the baronetage.' I did so. 'Good,' resumed Ferret, after turning over the leaves for a few seconds, 'very good, as far as it goes. It is now just two years and eight months since Sir Harry succeeded his uncle in the title and estates. You would no doubt soon have heard, madam, that your husband was dead. Truly the heart of man is deceitful above all things, and desperately wicked; and yet such conduct towards such a lady'—Ferret intended no mere compliment; he was only giving utterance to the thoughts passing through his brain; but his client's mounting colour warned him to change the topic, which he very adroitly did. 'You intend, of course,' said he, addressing me, 'to proceed at law? No rumble-tumble through the spiritual courts?'

'Certainly, if sufficient evidence to justify such a course can be obtained.'

'Exactly: Doe, demise of Compton, *versus* Emsdale; action in ejectment, judgment of ouster. Our friend Doe, madam—a very accommodating fellow is Doe—will, if we succeed, put you in possession as natural guardian of your son. Well, sir,' turning to me, 'I may as well give you an acknowledgment for that cheque. I undertake the business, and shall, if possible, be off to Leeds by this evening's mail.' The acknowledgment was given, and Mr Ferret, pocketing the cheque, departed in high glee.

'The best man, madam, in all broad London,' said I in answer to Mrs Grainger's somewhat puzzled look, 'you could have retained. Fond as he seems, and in fact is, of money—what sensible person is not?—Lord Emsdale could not bribe him with his earldom, now that he is fairly engaged in your behalf, I will not say to betray you, but to abate his indefatigable activity in furtherance of your interests. Attorneys, madam, be assured, whatever nursery tales may teach, have, the very sharpest of them, their points of honour.' The lady and her son departed, and I turned again to the almost forgotten 'case.'

Three weeks had nearly glided by, and still no tidings of Mr Ferret. Mrs Grainger, and her sister Emily Dalston, a very charming person, had called repeatedly; but as I of course had nothing to communicate, they were still condemned to languish under the heart-sickness caused by hope deferred. At last our emissary made his wished-for appearance.

'Well, Mr Ferret,' said I, on entering my library, where I found him composedly awaiting my arrival, 'what success?'

'Why, nothing of much consequence as yet,' replied he; 'I am, you know, only, as it were, just commencing the investigation. The Leeds parson that married them is dead, and the old clerk is paralytic, and has lost his memory. If, however, they were both alive, and in sound health of mind and body, they could, I fancy, help us but little, as Bilston tells me neither the Dalstons nor Grainger had ever entered the church till the morning of the wedding; and they soon afterwards removed to Cumberland, so that it is scarcely possible either parson or clerk could prove that Violet Dalston was married to Sir Harry Compton. A very intelligent fellow is Bilston: he was present at the marriage, you remember; and a glorious witness, if he had only something of importance to depose to; powdered hair and a pigtail, double chin, and six feet in girth at least; highly respectable—capital witness, very—only, unfortunately, he

can only testify that a person calling himself Grainger married Violet Dalston; not much in that!'

'So, then, your three weeks' labour has been entirely thrown away!'

'Not so fast—not so fast—you jump too hastily at conclusions. The Cumberland fellow that sold Grainger the house—only the equity of redemption of it, by the way—there's a large mortgage on it—can prove nothing. Nobody about there can, except the surgeon; he can prove Mrs Grainger's *accouchement*—that is something. I have been killing myself every evening this last week with grog and tobacco smoke at the "Compton Arms," in the company of the castle servants, and if the calves' heads *had* known anything essential, I fancy I should have wormed it out of them. They have, however, kindly furnished me with a scrawl of introduction to the establishment now in town, some of whom I shall have the honour to meet, in the character of an out-and-out liberal sporting gentleman, at the "Albemarle Arms" this evening. I want to get hold of his confidential valet, if he had one—those go-a-head fellows generally have—a Swiss, or some other foreign animal.'

'Is this all?'

'Why, no,' rejoined Ferret, with a sharp twinkle of his sharp gray eye, amounting almost to a wink; 'there is one circumstance which I cannot help thinking, though I scarcely know why, will put us, by the help of patience and perseverance, on the right track. In a corner of the registry of marriage there is written Z. Z. in bold letters. In no other part of the book does this occur. What may that mean?'

'Had the incumbent of the living a curate at the time?'

'No. On that point I am unfortunately too well satisfied. Neither are there any names with such initials in any of the Leeds churchyards. Still this Z. Z. may be of importance, if we could but discover who he is. But how?—that is the question. Advertise? Show our hands to the opposite players, and find if Z. Z. is really an entity, and likely to be of service, that when we want him in court, he is half way to America. No, no; that would never do.'

Mr Ferret I saw was getting into a brown study; and as I had pressing business to despatch, I got rid of him as speedily as I could, quite satisfied, spite of Z. Z., that Mrs Grainger's chance of becoming Lady Compton was about equal to mine of ascending the British throne some fine day.

Two days afterwards I received the following note:—
'DEAR SIR—Z. Z. is the man! I'm off to Shropshire. Back, if possible, the day after to-morrow. Not a word even to the ladies. Huzza! In haste,

SAMUEL FERRET.'

What could this mean? Spite of Mr Ferret's injunction, I could not help informing the sisters, who called soon after I had received the note, that a discovery, esteemed of importance by our emissary, had been made; and they returned home with lightened hearts, after agreeing to repeat their visit on the day Mr Ferret had named for his return.

On reaching my chambers about four o'clock in the afternoon of that day, I found the ladies there, and in a state of great excitement. Mr Ferret, my clerk had informed them, had called twice, and seemed in the highest spirits. We had wasted but a few minutes in conjectures when Mr Ferret, having ascended the stairs two or three at a time, burst, *sans cérémonie*, into the apartment.

'Good-day, sir. Lady Compton, your most obedient servant; madam, yours! All right! Only just in time to get the writ sealed; served it myself a quarter of an hour ago, just as his lordship was getting into his carriage. Not a day to lose; just in time. Capital! Glorious!'

'What do you mean, Mr Ferret?' exclaimed Emily Dalston: her sister was too agitated to speak.

'What do I mean? Let us all four step, sir, into your inner sanctum, and I'll soon tell you what I mean.'

We adjourned, accordingly, to an inner and more private room. Our conference lasted about half an hour, at the end of which the ladies took their leave: Lady Compton, her beautiful features alternately irradiated and clouded by smiles and tears, murmuring in a broken, agitated voice, as she shook hands with me, 'You see, sir, he intended at last to do us justice.'

The news that an action had been brought on behalf of an infant son of the late Sir Harry Compton against the Earl of Emsdale, for the recovery of the estates in the possession of that nobleman, produced the greatest excitement in the part of the county where the property was situated. The assize town was crowded, on the day the trial was expected to come on, by the tenantry of the late baronet and their families, with whom the present landlord was by no means popular. As I passed up the principal street, towards the court-house, accompanied by my junior, I was received with loud hurraings and waving of handkerchiefs, something after the manner, I suppose, in which chivalrous steel-clad knights, about to do battle in behalf of distressed damsels, were formerly received by the miscellaneous spectators of the lists. Numerous favours, cockades, streamers, of the Compton colours, used in election contests, purple and orange, were also slyly exhibited, to be more ostentatiously displayed if the Emsdale party should be beaten. On entering the court, I found it crowded, as we say, to the ceiling. Not only every seat, but every inch of standing-room that could be obtained, was occupied, and it was with great difficulty the ushers of the court preserved a sufficiently clear space for the ingress and egress of witnesses and counsel. Lord Emsdale, pale and anxious, spite of manifest effort to appear contemptuously indifferent, sat near the judge, who had just entered the court. The Archbishop of York, whom we had subpoenaed, why, his Grace had openly declared, he knew not, was also of course accommodated with a seat on the bench. A formidable bar, led by the celebrated Mr S——, was, I saw, arrayed against us, though what the case was they had to meet, so well had Ferret kept his secret, they knew no more than did their horse-hair wigs. Ferret had solemnly enjoined the sisters to silence, and no hint, I need scarcely say, was likely to escape my lips. The jury, special of course, were in attendance, and the case, 'Doe, demise of Compton *versus* Emsdale,' having been called, they were duly sworn to try the issue. My junior, Mr Frampton, was just rising 'to state the case,' as it is technically called, when a tremendous shouting, rapidly increasing in volume and distinctness, and mingled with the sound of carriage wheels, was heard approaching, and presently Mr Samuel Ferret appeared, followed by Lady Compton and her son, the rear of the party brought up by Sir Jasper Thornely, whose jolly fox-hunting face shone like a full-blown peony. The lady, though painfully agitated, looked charmingly; and the timid, appealing glance she unconsciously, as it were, threw round the court, would, in a doubtful case, have secured a verdict. 'Very well got up, indeed,' said Mr S——, in a voice sufficiently loud for the jury to hear—'very effectively managed, upon my word.' We were, however, in too good-humour to heed taunts; and as soon as silence was restored, Mr Frampton briefly stated the case, and I rose to address the jury. My speech was purposely brief, business-like, and confident. I detailed the circumstances of the marriage of Violet Dalston, then only eighteen years of age, with a Mr Grainger; the birth of a son; and subsequent disappearance of the husband; concluding by an assurance to the jury that I should prove, by incontrovertible evidence, that Grainger was no other person than the late Sir Harry Compton, baronet. This address by no means lessened the vague apprehensions of the other side. A counsel that, with such materials for eloquence, disdained having recourse to it, must needs have a formidable case. The smiling countenances of Mr S—— and his brethren became suddenly overcast, and the pallor and agitation of Lord Emsdale sensibly increased.

We proved our case clearly, step by step: the marriage, the accouchement, the handwriting of Grainger—Bilston proved this—to the letters addressed to his wife, were clearly established. The register of the marriage was produced by the present clerk of the Leeds church; the initials Z. Z. were pointed out; and at my suggestion the book was deposited for the purposes of the trial with the clerk of the court. Not a word of cross-examination had passed the lips of our learned friends on the other side: they allowed our evidence to pass as utterly indifferent. A change was at hand.

Our next witness was James Kirby, groom to the late baronet and to the present earl. After a few unimportant questions, I asked him if he had ever seen that gentleman before, pointing to Mr Ferret, who stood up for the more facile recognition of his friend Kirby.

'Oh yes, he remembered the gentleman well; and a very nice, good-natured, soft sort of a gentleman he was. He treated witness at the "Albemarle Arms," London, to as much brandy and water as he liked, out of respect to his late master, whom the gentleman seemed uncommon fond of.'

'Well, and what return did you make for so much liberality?'

'Return! very little I do assure ye. I told un how many horses Sir Harry kept, and how many races he won; but I couldn't tell un much more, pump as much as he would, because, do ye see, I didn't *know* no more.'

An audible titter from the other side greeted the witness as he uttered the last sentence. Mr S——, with one of his complacent glances at the jury-box, remarking in a sufficiently loud whisper, 'That he had never heard a more conclusive reason for not telling in his life.'

'Did you mention that you were present at the death of the late baronet?'

'Yes I did. I told un that I were within about three hundred yards of late master when he had that ugly fall; and that when I got up to un, he sort of pulled me down, and whispered hoarse-like, "Send for Reverend Zachariah Zimmerman." I remembered it, it was sich an outlandish name like.'

'Oh, oh,' thought I, as Mr S—— reached across the table for the parish register, 'Z. Z. is acquiring significance I perceive.'

'Well, and what did this gentleman say to that?'

'Say? Why, nothing particular, only seemed quite joyful 'mazed like; and when I asked un why, he said it was such a comfort to find his good friend Sir Harry had such pious thoughts in his last moments.'

The laugh, quickly suppressed, that followed these words, did not come from our learned friends on the other side.

'Sir Harry used those words?'

'He did; but as he died two or three minutes after, it were of course no use to send for no parson whatsoever.'

'Exactly. That will do, unless the other side have any questions to ask.' No question was put, and the witness went down. 'Call,' said I to the crier of the court—'call the Reverend Zachariah Zimmerman.'

This was a bomb-shell. Lord Emsdale, the better to conceal his agitation, descended from the bench and took his seat beside his counsel. The Reverend Zachariah Zimmerman, examined by Mr Frampton, deposed in substance as follows:—'He was at present rector of Dunby, Shropshire, and had been in holy orders more than twenty years. Was on a visit to the Reverend Mr Cramby at Leeds seven years ago, when one morning Mr Cramby, being much indisposed, requested him to perform the marriage ceremony for a young couple then waiting in church. He complied, and joined in wedlock Violet Dalston and Henry Grainger. The bride was the lady now pointed out to him in court; the bridegroom he had discovered, about two years ago, to be no other than the late Sir Harry Compton, baronet. The initials Z. Z. were his, and written by

him. The parish clerk, a failing old man, had not officiated at the marriage; a nephew, he believed, had acted for him, but he had entered the marriage in the usual form afterwards.'

'How did you ascertain that Henry Grainger was the late Sir Harry Compton?'

'I was introduced to Sir Harry Compton in London, at the house of the Archbishop of York, by his Grace himself.'

'I remember the incident distinctly, Mr Zimmerman,' said his Grace from the bench.

'Besides which,' added the rector, 'my present living was presented to me, about eighteen months since, by the deceased baronet. I must further, in justice to myself, explain that I, immediately after the introduction, sought an elucidation of the mystery from Sir Harry; and he then told me that, in a freak of youthful passion, he had married Miss Dalston in the name of Grainger, fearing his uncle's displeasure should it reach his ears; that his wife had died in her first confinement, after giving birth to a still-born child, and he now wished the matter to remain in oblivion. He also showed me several letters, which I then believed genuine, confirming his story. I heard no more of the matter till waited upon by the attorney for the plaintiff, Mr Ferret.'

A breathless silence prevailed during the delivery of this evidence. At its conclusion, the dullest brain in court comprehended that the cause was gained; and a succession of cheers, which could not be suppressed, rang through the court, and were loudly echoed from without, Sir Jasper's voice sounding high above all the rest. Suddenly, too, as if by magic, almost everybody in court, save the jury and counsel, were decorated with orange and purple favours, and a perfect shower of them fell at the feet and about the persons of Lady Compton, her sister, who had by this time joined her, and the infant Sir Henry. As soon as the expostulations and menaces of the judge had restored silence and order, his lordship, addressing Lord Emsdale's senior counsel, said, 'Well, Brother S—, what course do you propose to adopt?'

'My lord,' replied Mr S— after a pause, 'I and my learned friends have thought it our duty to advise Lord Emsdale that further opposition to the plaintiff's claim would prove ultimately futile; and I have therefore to announce, my lord and gentlemen of the jury, that we acquiesce in a verdict for the plaintiff.'

'You have counselled wisely,' replied his lordship. 'Gentlemen of the jury, you will of course return a verdict for the plaintiff.'

The jury hastily and joyfully assented: the verdict was recorded, and the court adjourned for an hour in the midst of tumultuous excitement. The result of the trial flew through the crowd outside like wildfire; and when Lady Compton and her son, after struggling through the densely-crowded court, stepped into Sir Jasper's carriage, which was in waiting at the door, the enthusiastic uproar that ensued—the hurraing, shouting, waving of hats and handkerchiefs—deafened and bewildered one; and it was upwards of an hour ere the slow-moving chariot reached Sir Jasper's mansion, though not more than half a mile distant from the town. Mr Ferret, mounted on the box, and almost smothered in purple and orange, was a conspicuous object, and a prime favourite with the crowd. The next day Lord Emsdale, glad, doubtless, to quit the neighbourhood as speedily as possible, left the castle, giving Lady Compton immediate possession. The joy of the tenantry was unbounded; and under the wakeful superintendence of Mr Ferret, all claims against Lord Emsdale for received rents, dilapidations, &c. were adjusted, we may be sure, *not* adversely to his client's interests; though he frequently complained, not half so satisfactorily as if Lady Compton had not interfered, with what Mr Ferret deemed misplaced generosity in the matter.

As I was obliged to proceed onwards with the circuit, I called at Compton Castle to take leave of my interesting and fortunate client a few days after her installa-

tion there. I was most gratefully received and entertained. As I shook hands at parting, her ladyship, after pressing upon me a diamond ring of great value, said, whilst her charming eyes filled with regretful, yet joyful tears, 'Do not forget that poor Henry intended at last to do us justice.' Prosperity, thought I, will not spoil that woman. It has not, as the world, were I authorised to communicate her *real* name, would readily acknowledge.

GOSSIP ON MINERALS.

A VERY attractive volume is before us, professing to convey 'such information on the more important minerals and their uses as an inquiring mind may be desirous of possessing without going minutely into the subject.*' The only fault we have to find with the execution of the task, is the epistolary blending of scientific and young-ladyish gossip. The author, in revising his letters for the public, should have been satisfied with the former; which is in reality so amusing, as to make the small-talk with his fair cousin, his dearest Florence, vexatiously insipid. A book of this kind is usually passed over by reviewers with a general sentence of commendation; but in the present case we think it better, both for author and reader, to give some examples of the kind of entertainment with which it abounds.

In treating of the salts, Mr Jackson does not fail to remark to his fair correspondent that the smelling-bottle she thinks so elegant an appendage is filled from the refuse of the stable; the volatile sal ammoniac, though a solid white salt, being formed by the union of two æriform bodies—carbonic acid gas and ammoniacal gas—obtained from animal and vegetable matters in a state of putrefaction.

Potash, another alkaline salt, but of very different properties, is likewise obtained from the most worthless rubbish. The thistles, potato-stalks, &c. from which it is made are burnt, and the salts contained in their ashes dissolved by the admixture of water. The water, on being drawn off, is evaporated, and what remains is the potash of commerce. This, with nitric acid, forms saltpetre, of such extensive use in the manufacture of glass and the murder of men. Saltpetre is found among minerals, united with nitric acid; but perhaps the greater part is obtained from the produce of the rubbish-heap and dunghill, left to rot in the open air, and the liquor which is the result filtered and crystallised.

The salts which exist in solution in the sea (the greater part of which is common culinary salt), would cover all Europe and its islands and waters to the height of about 16,000 feet. Near Montserrat in Spain there is a mass of compact salt 500 feet high, and 16,000 feet in circumference; and in other parts of the world there are likewise vast aggregations of the same mineral. The rock-salt of Kirman is so hard, that it is employed, like stone, for building purposes. In the famous salt-mines of Wieliczka in Poland, 'there exists in the first or upper storey a chapel, wholly sculptured out of the salt, and dedicated to St Anthony. This chapel is 30 feet long by 24 in breadth, and 18 in height; the altar and steps, the candelabra and other ornaments, the twisted columns that sustain the roof, the pulpit, the crucifix, and the statues of the Virgin and of St Anthony, are all sculptured in salt, as is also a statue of Sigismund, king of Poland.'

The earthy salt, alum, is produced in great abundance both by nature and art. It is used in dyeing, candle-making, preparing leather, &c. and renders paper and wood almost incombustible. Alum is the great secret of our fire-kings; for when reduced with common salt to an impalpable powder, and several coats of it, mixed with spirits of wine, spread upon the hand, we may grasp a red-hot iron without inconvenience.

The various forms of carbonate of lime—mountains,

* Minerals and their Uses. In a Series of Letters to a Lady. By J. R. Jackson, F.R.S. London: Parker. 1849.

marble temples and statues, pearls and coral, form an interesting part of the subject. The caverns contained in limestone rocks are frequently adorned with stalagmites in the form of pyramids, columns, altars, organ-pipes, vases, and flowers. These stalagmites rise from the bottom, being formed of the sediment deposited by the drops from above, and are eventually met by the stalactites from the roof. This process goes on till the cavern is filled up, and becomes a solid deposit of alabaster. The fine ladies of antiquity kept their cosmetics in vessels of alabastrite, or gypseous alabaster; while the Roman ladies applied the calcareous alabaster to the purpose of lachrymatories, or vases for receiving the tears they shed for their deceased husbands. The same material was used for cinerary urns to preserve the ashes of the dead. The fluat of lime, commonly called fluor spar, imitates very beautifully the emerald, sapphire, and other gems; but it is comparatively soft, being scratched even by rock-crystal. Its fluoric acid, however, when disengaged, has the power in turn of dissolving the crystal. 'The fluat of lime is phosphorescent by heat, and in a darkened room it shines with a very beautiful-coloured light. If, then, you have the iron stove of your boudoir studded in any fanciful manner, as, for instance, in the form of a wreath of leaves and flowers with various-coloured pieces of fluor spar, you will have a pretty object in the day-time; and when at night your lamp is extinguished, the garland will show with a soft and exquisitely-beautiful effect, of which you may form some idea by pounding some of the green Derbyshire spar, and placing it in the dark on a heated shovel.'

The gems are represented still more closely, because with greater hardness, by quartz. When of a violet colour, this is called amethyst; red, it is the Bohemian or Silesian ruby; yellow, it is the Scotch topaz or cairngorm, &c.; but when perfectly pure or colourless, it is rock-crystal. A mass of Alpine rock-crystal, weighing eight hundredweight, was taken by the French in Italy, and brought to Paris in 1797. Sometimes it is susceptible of a fine polish, and is termed Bohemian, British, Irish, &c. diamonds. 'The most beautiful work executed in rock-crystal is, in the opinion of Mr Sage, an urn nine inches and a-half in diameter, and nine inches high, and of which the pedestal was taken from the same block. This vase is enriched with carvings and masks, and the history of the intoxication of Noah, all most admirably sculptured. This splendid piece of workmanship, which belonged to the king of France, cost upwards of L.4000.'

The variety of rock-crystal called the amethyst takes its name from a Greek word signifying 'that which is not drunk,' the ancients having believed that one might drink wine out of an amethyst vessel without any risk of intoxication. 'They also thought that by wearing this stone they could foresee future events in dreams, that it drove away evil thoughts, assured presence of mind, and secured the favour of princes; and when adorned with figures of the sun or moon, it was worn as a charm against poisons.' The following is mentioned in the 'Curiosities of Literature':—'There was found on an amethyst a number of marks or indentations which had long perplexed antiquaries, more particularly as similar marks or indents were frequently found on ancient monuments. It was agreed on (and as no one could understand them, all would be satisfied) that they were secret hieroglyphics. It, however, occurred to the French antiquary Pieresc that these marks were nothing more than holes for small nails, which had formerly fastened little laminæ that represented so many Greek letters. This hint of his own suggested to him to draw lines from one hole to another, and he beheld the amethyst reveal the name of the sculptor, and the frieze of the temple the name of the god. This curious discovery has been since frequently applied.'

The agate called carnelian is much valued by some of the Eastern nations. The Arabs believe that it stops bleeding when applied to the part. 'In order to test it,

they wrap it up in paper, which, on the application of a hot coal, should not burn, if the stone be good. M. Renaud tells us that he has often seen the people of the East perform a similar operation with perfect success. They cover the carnelian with their handkerchief, and then bring it to the flame of a taper as if they would burn it; but the handkerchief resists the most ardent flame, and even remains perfectly white.' Mohammed declared that he who sealed with a carnelian would always be in a state of blessedness and joy; but Mr Jackson tried both experiments, and without success.

Agates occasionally represent with wonderful accuracy the appearance of faces, figures, and other objects. 'Pliny speaks of an agate belonging to King Pyrrhus which represented the nine Muses, with Apollo in the midst holding a lyre; the whole being most perfect, though a mere freak of nature. Majolus informs us that there is in Venice an agate on which is the figure of a man thus drawn by the hand of nature. It is also said that in the Church of St John, at Pisa, there is a stone of the same kind, representing an old hermit in a desert, seated on the banks of a stream, and holding in his hand a little bell, just in the way St Anthony is generally painted.' A Scotch friend of Mr Jackson possessed an agate 'on which was the most admirably perfect representation of the sun setting beneath the sea. The lower half of the stone was in parallel lines of light gray, blue and white interspersed, in the way calm water is painted. On the upper edge of this, and exactly in the middle, was seen half of the sun's disk, from which rays diverged, filling up the rest of the stone. But the most remarkable agate of this kind I ever saw was in the possession of the Dominicans, in one of their convents abroad. It represented a most admirable portrait of Louis XVI. in profile, with a blood-coloured crescent-formed streak right across the throat. There were also other marks having allusion to that monarch, but which I do not now remember.'

Flints furnish their share of gossip. A good workman can make 500 gun-flints in the day; but, as if in punishment for the preparation of so mischievous an agent, he dies early—before thirty years of age—of consumption, brought on by inhaling the flinty dust. In striking fire with flint and steel, the result, we all know, is a quantity of sparks and little brilliant coruscations. 'In order to know what these really are, let the blows be given over a sheet of paper, and then examine with a magnifier the small particles that have fallen on the paper: you will find them to be of three kinds. *First*, minute splinters of the flint struck off by the blow, and which remain unaltered; *secondly*, little chips of steel of an irregular form, but also unaltered; and *thirdly*, small round bodies, ten times smaller than a pin's head: these latter have the appearance of a scoria or cinder, and being hollow, may be crushed with the nail like little globes of glass. These have generally been taken for little bullets of melted iron, but M. Brard suspects them to be a combination of silica and iron, a true scoria, attractable by the magnet; the heat produced by the blow being sufficient to heat the steel-chips red-hot, and effect the combination of the silica and iron in the smaller molecules, which are those that coruscate in little brilliant stars with a hissing noise.'

The preparation of the beautiful and costly pigment known by the name of ultra-marine is described as follows:—'The pieces of lazulite, the most rich in colour, are picked out; they are washed, and then plunged into vinegar; and if the colour does not change, the quality is esteemed to be good. The stones are then again repeatedly heated, and plunged each time into vinegar. By this means they are easily reduced to an impalpable powder. This is then well worked up into a paste with resin, white wax, and linseed-oil, to which some add Burgundy pitch. The paste is then put into a linen bag, and kneaded under water, which at first assumes a grayish colour, resulting from the impurities that are first separated from the mass. This water is thrown away, and replaced by fresh, and the kneading

recommenced, when the water becomes of a fine blue. This is poured off, and allowed to settle, the precipitate being ultra-marine of the finest quality. The repetition of the process furnishes colour of inferior quality in succession; and finally, the residuum, being melted with oil, and kneaded in water containing a little soda or potash, yields what is termed *ultra-marine ashes*.

The emerald was one of the stones to which superstition ascribed occult virtues; but the early Peruvians (before the government of the Incas) paid divine honours to an emerald of the size of an ostrich's egg. When it was exhibited on great festivals, the people came from far and near to worship the goddess, and present young emeralds to her, which they called her daughters. These daughters were all found by the Spaniards; but the mother was so effectually hidden by the Indians, that she has not been discovered to this day.

Amianthus, the well-known variety of asbestos, is composed of filaments which, with the addition of a little flax, may be carded, spun, and woven into a cloth. In this cloth the ancients wrapped the bodies of their distinguished dead before they were consumed on the funeral pile, for the purpose of keeping their ashes separate from those of the fuel. 'It is said that Charlemagne had a tablecloth of amianthus, which he took pleasure in throwing into the fire after dinner, for the amusement of his guests.' In the 'Dictionnaire Oriental,' it is said—'It cannot be doubted that the cloth which may be thrown into the fire (without injury) is that which the Greeks call *asbestos*. We are not agreed as to the matter of which the cloth is made, nor do the Chinese themselves know it any better than we do. Some even say it is wove of the hair of certain rats that live in the flames of certain volcanoes.' These rats, doubtless, were the salamander. In our day the origin of the amianthus is no longer a mystery, as it is found in England, Scotland, and other European countries. 'There was a lady at Como who manufactured cloth of different degrees of fineness, and even lace, of amianthus. The lady of the viceroy of Italy, in Napoleon's time, possessed a veil of amianthus. In Siberia also, purses, caps, gloves, and similar articles, are some knitted, others woven, of amianthus. In the Pyrenees, girdles are made of the same substance intermingled with silver thread. These girdles are much esteemed by the women, not only on account of their beauty, but for certain mysterious properties they were believed to possess. Amianthus has also been employed as incombustible wicks; and it has been suggested that the perpetual lamps of the ancients were formed of this substance, and constantly supplied by a spontaneous oozing of petroleum. It is also asserted that the Greenlanders use wicks of amianthus. Attempts have been made to manufacture incombustible paper of this mineral; and M. Demidoff, a Russian proprietor of great wealth, even offered to supply all the government offices of the empire with this kind of paper; but up to the present time the attempt has not succeeded.'

On the subject of diamonds we have the following gossip:—This diamond, the Sanci, formerly belonged to Charles the Bold, Duke of Burgundy, who wore it in his hat at the battle of Nancy, where his army was completely defeated, and where he lost his life, in 1477. It was found on the field of battle by a Swiss soldier, who sold it to a French gentleman of the name of Sanci. The diamond was preserved in the family of this gentleman for nearly a hundred years, until Henry III. commissioned a descendant of that family, who was a captain in the Swiss troops in his service, to raise fresh recruits among the Swiss. Driven from his throne by a league which his subjects had formed against him, the monarch, without money to pay his troops, borrowed the Sanci diamond, in order to pawn it to the Swiss. Sanci charged one of his servants to take it to its destination, but both the man and the diamond disappeared, no one could tell whither. The king reproached Sanci bitterly for having confided an object of such value to a valet. But Sanci, full of confidence in

his servant, set out in search, and discovered that the man had been assassinated by robbers, and that the body was buried in a neighbouring forest. Thither he went, ordered the body to be disinterred and opened, when the diamond was discovered in his stomach; the faithful servant having swallowed it, the more effectually to hide it from the rapacity of the brigands. From that time it has always been called the Sanci diamond. It ultimately came into the possession of an English monarch.'

Glass is not cut with the point of a glazier's diamond, but with the curved edge formed by the meeting of two contiguous curved facets of the stone. A pointed diamond ring merely scratches the glass—it does not cut it; and writing in this way is attended with some risk to the ring, as diamonds, though hard, are not difficult to break. The diamond was supposed to protect from poison, pestilence, panic-fear, hallucination, enchantments, &c. It likewise calmed anger, maintained affection between man and wife, and was thence called the stone of reconciliation. Mr Jackson might have added that it possesses these latter virtues to this day. 'A talismanic virtue was also attributed to it: when, under a favourable aspect, and under the planet Mars, the figure of this divinity, or of Hercules surmounted by a hydra, was engraved upon it, in such case it secured the victory to him who wore it, whatever might be the number of his enemies. It was even pretended that diamonds engendered other diamonds (this is a *pendant* for the Peruvian emerald mentioned in a former letter); and Rucius informs us that a Princess of Luxemburg had some hereditary diamonds that produced others at certain times (why not, if money makes money?). In the language of iconology, the diamond is the symbol of constancy, of strength, of innocence, and other heroic virtues.'

This is sufficient to show the stuff of which the work is composed; and such of our readers as desire a little amusement blended with a little instruction, cannot do better than send for the volume itself.

OCCASIONAL NOTES.

ELEGANT READING.

IN the rage for making children understand all that they read at school, reading itself is now too much overlooked. At some schools of no small note, to hear more than a full sentence enunciated at a time is a rarity. It is more common to hear the young learners stopped at the end of three words, that some one of these words may be made the theme of an examination, philological, scientific, and historical, running off into an episode of several minutes, till the scholar has been perhaps driven into a field of intelligence ten thousand miles away from the point of starting, and himself and his audience are alike tired. The old system of explaining nothing was bad; but it is almost as bad to make school exercises consist of little besides an eternal jabber from Philips's 'Million of Facts,' or 'Maunder's Treasury of Knowledge.' Formerly it was a glory for a young person to be a good reader. At most schools, it is now scarcely to be expected of any that he should acquire the art of reading fluently, elegantly, and with expression. It would be well, we think, while taking care that the *intellectual system* is not lost sight of, to see that this accomplishment is also duly attended to. Of its value we get a lively idea when we hear a Charles Kemble or a James Russell give their readings from Shakspeare, a kind of entertainment of which no one could form an adequate idea till they heard it, so much of all that is most valuable in good acting does it involve. With even a moderate endowment of such a gift, we can imagine no resource for the amusement of a family circle during the long evenings superior to this; nothing

more serviceable amongst a group of young business men living together, or in a workshop where the nature of the employment is such as to admit of the voice being heard, and due attention being given. Far from being a dull amusement, our experience represents it as, on the contrary, fascinating and exciting—combining, indeed, all the pleasures of 'taking a book' with those derivable from company. For the success, however, of readings in families or elsewhere, it is essential that a power of easy and agreeable enunciation be acquired; and to favour this, it appears to us that some change in our present plans and modes of school-instruction is necessary. We must cease to be so wholly for the understanding, and begin to give a little more attention to the manner and form.

THE ARTICLE 'REACTION AGAINST PHILANTHROPY.'

We find that the article in No. 269, entitled 'Reaction against Philanthropy,' has been so far misunderstood in some quarters, as to be made a theme of unfavourable remark. The gravamen of the charge brought against us is, that we approve of a return to the old system of severe punishments for criminals, and indifference towards the claims of the poor. There is certainly nothing in the article to substantiate this charge, and we must protest against any such meaning being attached to it. It is well known that we have for many years been the advocates of a mild criminal code, and that scarcely any project for the promotion of the physical and moral wellbeing of the humbler classes of the community has failed to receive early and efficient support from this Journal. It was therefore very unlikely that any writing capable of being interpreted by a cool or candid person into such a spirit should have appeared here. In reality, the design of the article was rather to moderate that reaction against philanthropic schemes which appears to be setting in. We admitted that the philanthropy of the past age, itself a generous reaction from the mercilessness and indifference of a preceding era, had been carried to extravagance in some points, and we expressed ourselves as prepared to see the ebb of this tide attended by many circumstances of anything but a rose-water character. We advocated, what we have all along advocated, the principles of self-reliance, of industrious application, and prudent frugality, as those most indispensable to the welfare of individuals. But so far from dictating one inhumane step, or expressing any indifference on such subjects, we both intreated that the transition, if there was to be a transition, to a somewhat sterner system, should be a gentle and gradual one, and expressed our belief that, 'by the never-failing humanity of such a society as ours,' no monstrous outrage would be committed. While we enforced the maxim, that it is incumbent on all to work, that they may not want, as the only economical one by which society in the mass could be benefited, the claims of those who cannot work, and of those who, in particular exigencies, cannot find employment, were expressly admitted, though only on the ground of humanity. These reclaimers, indeed, bear a small proportion of space; but this was because the main object was a discussion of the *fact* of the reaction, and an exposition of the principles on which it might be presumed that the world was not to be permanently and wholly a scene of pure philanthropy, the error to which we seemed lately to be tending, and from which the present reaction takes its rise.

We can assure all who may have been thrown into doubt on the subject, that we are, and ever must be, lovers of our kind. We must, however, confess that, other circumstances being equal, we are most disposed to feel intensely, not for the idle and dissolute, but for the worthy and industrious; not for the abject soulless batteners on public bounty in all its shapes, but for the constant, modest, distressed tax and rate-payers, who struggle under many difficulties to preserve

their independence, and observe the decencies of life—who make no figure perhaps in novels and orations, but who are, in very fact, the back-bone of the British empire.

ODDS AND ENDS OF A SPORTSMAN.*

THIS book reminds us of the conversation of a sportsman after a hard day's shooting. He has eaten and drunken; he has turned his chair half round to the fire; a sensation of warmth and comfort opens his heart and loosens his tongue; while a slight degree of fever withal, the consequence of fatigue and excitement, gives an incoherence to his ideas which, though amusing for a while, ends by making us vote him a bore. He skips from one subject to another, in the chance-medley way in which the game appeared. He winds and doubles, repeats himself a dozen times over, and brings out his observations, just as, before sitting down, he had shaken forth the heterogeneous contents of his wallet.

In one way, however, the garrulous sportsman is better company than the book; for a question now and again has all the utility of an index, and brings him back to the point you wish to note, however far he may have travelled from it. In the book, the moment you turn the page the thing is irrevocably lost. This defect seems to have struck either the author or publisher; but the plan fallen upon to remedy it has but little ingenuity. It is simply to break up the mass of materials, without the slightest attempt at arrangement, and call one portion a Tour in Sutherland; another, Field-Notes; and a third, Extracts from Note-Books.

It is so far a compliment to Mr St John, however, to complain of the want of a clue, for his facts or ideas must occasionally be of some value, or we should not care about fixing them. And indeed the book, although to read it straight through is like reading a dictionary, has much that is entertaining, and something that is useful; and the numerous class of persons interested in such subjects will, we have no doubt, feel considerable interest in dipping now and then into its heterogeneous pages.

That class does not seem to diminish much either in numbers or enthusiasm. It is of little consequence whether the quarry is a tiger or a hare, a vulture or a partridge, the chase appears to awaken pretty nearly the same excitement, and to be associated in pretty nearly the same degree with ideas of courage and manliness. The reason, no doubt, is to be found in the air, the exercise, the natural scenery, the determinate pursuit; and likewise, perhaps, in the thirst of blood as an instinct of carnivorous man. It is of little consequence what creature it is whose life we seek; although the enjoyment may be enhanced by the difficulty of the enterprise, and we should thus derive more pleasure from stalking a deer than from shooting a rabbit. But we altogether deny that the love of the chase presents the human character in its manliest phasis. Occasionally it does the very reverse, when it leads the sportsman to delight in mere slaughter. In the very book before us there is an account of the butchery of a deer (given in a detail betraying much bad taste), which, by the graphic picture it draws of the human fears and human agonies of the poor maimed animal, suggests irresistibly the idea of—murder.

A description, in much better taste, of the assassination of an osprey by our author himself, points to other feelings of a more affecting kind shared with us by the lower animals. The nest was on a rock rising from a beautiful and solitary lake; and the sportsman, after lying in wait for some time among the cliffs on the margin of the water, had the satisfaction to see his victim rise from its retreat. 'For some time after the

* Tour in Sutherlandshire, with Extracts from the Field-Books of a Sportsman and Naturalist. By Charles St John, Esq., author of 'Wild Sports and Natural History of the Highlands.' With Woodcuts. 2 vols. London: Murray. 1849.

departure of my companions, she flew round and round at a great height, occasionally drifting away with the high wind, and then returning to the loch. She passed two or three times not very far from me before I shot at her. But at last I fired, and the poor bird, after wheeling blindly about for a few moments, fell far to leeward of me, and down amongst the most precipitous and rocky part of the mountain, quite dead. She was scarcely down behind the cliffs when I heard the cry of an osprey in quite a different direction, and on looking that way, I saw the male bird flying up from a great distance. As he came nearer, I could distinguish plainly with my glass that he was carrying a fish in his claws. On approaching, he redoubled his cries, probably expecting the well-known answer or signal of gratitude from his mate; but not hearing her, he flew on till he came immediately over the nest. I could plainly see him turning his head to the right and left, as if looking for her, and as if in astonishment at her unwonted absence. He came lower and lower still, holding the fish in his feet, which were stretched out at full length from his body. Not seeing her, he again ascended, and flew to the other end of the lake, the rocks echoing his shrill cry. The poor bird, after making one or two circuits of the lake, then flew away far out of sight, still keeping possession of the fish. He probably went to look for the female at some known and frequented haunt, as he flew rapidly off in a direct line. He soon, however, came over the lake again, and continued his flight to and fro and his loud cries for above an hour, still keeping the fish ready for his mate. I at length heard the voices of my friends, and we soon launched the boat. The osprey became much agitated as we neared the rock where the nest was, and dropped the fish he held into the water. We found two beautiful eggs in the nest, of a roundish shape; the colour white, with numerous spots and marks of a fine rich red brown. As we came away, we still observed the male bird unceasingly calling and seeking for his hen. I was really sorry that I had shot her.

Another osprey's nest is described as consisting of a perfect cartload of sticks, some as large as a very stout walking-stick, the lining being composed of coarse grass. It was not less than eight feet in length, and four in width. Many other birds have the same conjugal attachment as the osprey. Mr St John mentions a hen grouse caught in a trap, whose mate collected, with many hours' labour, at least a hatful of the tender sprigs of the heather, and laid them beside the prisoner; and he gives a pretty picture of the mutual attachment of two red-necked phalaropes, feeding in a little pool mantled with weeds. 'Whenever, in their search for food, they wandered so far apart as to be hidden by the intervening weeds, the male bird stopped feeding suddenly, and looking round, uttered a low and musical call of inquiry, which was immediately answered by the female in a different note, but perfectly expressive of her answer, which one might suppose to be to the purport that she was at hand and quite safe. On hearing her, the male immediately recommenced feeding, but at the same time making his way towards her; she also flew to meet him. They then joined company for a moment or two, and after a few little notes of endearment, turned off again in different directions. This scene was repeated a dozen times while I was watching them.' Even a cat is an affectionate and devoted mother. One had her kitten carried more than a mile off, while its twin was left at home; and the poor mother, who lived in a large town, dared every night the dangers of boy and dog, and made a journey to suckle her distant offspring, returning, as soon as the process was over, to perform the same duty to the other. The otter goes beyond this. Not only does she feed her young, but the young repay her cares with filial respect. 'My keeper tells me that he has seen an old otter feeding her young with fish; the two young ones were sitting on a flat stone at the edge of the burn when their parent brought them a good-sized trout. They immediately both seized the fish, pulling and tearing at it like two

bulldog puppies. At last they came to a pitched battle with each other, biting, squealing, and tugging, and leaving the trout to its fate. On this the old one interfered, and making them quiet, gave the trout to one of them as his own. The other young one, on seeing the parent do this, no longer interfered, but sat quietly looking on, till the old otter (who in the meantime had renewed her fishing) came back with a large trout for it also.'

This may be instinct, but what shall we call the stratagem fallen upon by a fox to get hold of a fine mallard, feeding with its companions at the rushy end of a Highland lake? He crept round to windward, and set afloat upon the loch some bunches of dead rushes, which floated down among the ducks without causing alarm. He repeated the experiment again and again, till he had accustomed the ducks to the appearance; and then, taking in his mouth a bunch of the same kind, he floated himself gently off, with nothing above the water but his snout and ears. In this way he drifted down among the unsuspecting feeders, and captured his victim. This is precisely the mode of duck-hunting practised in some of the rivers in China. The Celestial sportsman sends a gourd now and again to drift among the ducks, who, by and by, feel themselves all on a sudden drawn under the water by some mysterious agency. The explanation is, that the last of the gourds has within it the hand of a Chinaman, who makes use in this manner of his hands. Mr St John does not give the story of the fox on his own authority; but he himself saw 'one in confinement lay out part of his food just within reach of his chain, in order to attract the tame ducks and chickens about the yard; and then, having concealed himself in his kennel, wait in an attitude, ready to spring out, till some duck or fowl came to his bait, which he immediately pounced upon.'

Our author is of opinion that few or no wild animals die either from natural disease or old age. They either serve as food for each other, or fall a victim to the general devourer—man. When unmolested, wild birds more especially, he thinks, live in a state of constant enjoyment; and even when the evil hour comes, their terror or pain is of short duration, having no anticipation, and if they escape, but little memory. Their want of anticipation, however, we doubt; for wild animals, and more especially birds, appear to be in a state of constant alarm. Many of them, even when roving in flocks, cannot go to feed in comfort before placing a sentinel to keep watch. His own account of the precautions of wild geese is interesting. 'Wild geese, while feeding on the open fields, invariably leave one bird to keep watch, and most faithfully does she perform this duty. Keeping on some high spot of the field, she stands with neck perfectly erect, watching on all sides, and listening to every sound far or near. Nor does she attempt to snatch at a single grain, however hungry she may be, till one of her comrades thinks fit to relieve her guard; and then the former sentinel sets to work at her feeding with an eagerness which shows that her abstinence while on duty was the result not of want of appetite, but of a proper sense of the important trust imposed on her. If any enemy, or the slightest cause of suspicion appears, the sentry utters a low croak, when the whole flock immediately run up to her, and, after a short consultation, fly off, leaving the unfortunate sportsman to lament having shown the button of his cap or the muzzle of his gun above the bank of the ditch, along which he had perhaps been creeping, "suadente diavolo," for the last half-hour up to his knees in water, well iced to the temperature of a Scotch morning in February.' These birds are likewise quick in taking hints from creatures not of their own species. Once when our sportsman was lying in wait for them in a hiding-place, a couple of gulls chanced to come by, and detecting him at once as a suspicious character, immediately began screaming and wheeling round his head. This was enough for the geese, who were dispersed throughout the field, and they immediately took to flight.

The manner in which woodcocks are described as transporting their young from the wood to the swamp is curious. This operation, it seems, they perform in the evening, by taking up the unfledged bird in their claws, and carrying it down to the soft feeding-grounds. They bring it back in the same way, before daylight, to the shelter of the woods, where it remains in security during the whole day. This story may be doubted by those who take their analogies from the young of partridges and other birds, which run vigorously about as soon as they are hatched; but with snipes, woodcocks, and waders, the case is different. Their bills take some time to harden, and their legs and wings to strengthen; and without the assistance of the parent birds they would certainly perish, as their nests are usually placed in dry heathery woods, which afford nothing for their support.

While on the subject of birds, we must not omit to mention the fact—which all of us, as well as Mr St John, must have remarked—that notwithstanding the kind of religious immunity they enjoy, the robins do not appear to increase in numbers. We have the same solitary visitor of this species, year after year, with hardly a single rival to dispute the ground with him. The reason is supposed to be that the robin thinks fit to build upon the ground, and that the rats, weasels, and other animals, do not share in the tender feelings with which he is regarded by mankind. But this, after all, is no great matter; for your robin is the most litigious, irritable, desperate fellow imaginable. 'When snow and frost cover the ground, and we feed the birds at the windows and on the gravel walks, thrushes, blackbirds, sparrows, and many other birds come to share the crumbs, but none dare eat if any robin is there, until the fiery little fellow permits him. Thrushes and all are beaten and driven away, and even after he has crammed himself to repletion, the robin will sit at the window and drive away with the most furious attacks every bird whose hunger prompts him to try to snatch a morsel of his leavings. Perched amidst the crumbs, he looks the very personification of ill temper and pugnacity.' The thrush is more mild, or less inhospitable. He freely allows other birds to share with him; and even when some impudent vagabond among them snatches at the morsel in his bill, he looks more in sorrow than in anger.

Our author is as amusing in his remarks on fish. 'Among others,' says he, 'I have more than once seen a most hideous large-headed brute of a fish, whom the country people call sometimes "the sea-devil," sometimes "the sea-angel," but whose more regular cognomen is, I believe, "the sea-angler." The first name he owes to his excessive and wicked-looking ugliness; the second must have been given him ironically; whilst the third is derived from his reputed habit of attracting fish to their destruction by a very wily ruse. He buries himself, it is said, in the sands, by scraping a hole with his two most unseemly and deformed-looking "hands," which are placed below what may be called his chin. Being in this way quite concealed, he allows some long worm-like appendages, which grow from the top of his head, to wave and float above the surface of the sand: fish, taking these for some kind of food, are attracted to the spot, when the concealed monster, by a sudden spring, manages to engulf his victims in the fearfully wide cavity of his mouth, which is armed with hundreds of teeth sloping inwards, and as hard and sharp as needles, so that nothing which has once entered it can escape. So runs the tale, the exact truth of which I am not prepared to vouch for.'

Our author's personal adventures are neither numerous nor uncommon; but one hairbreadth 'scape when in pursuit of ptarmigan is worth mentioning. The scene was the summit of a mountain covered with snow, and sloping down to a nearly perpendicular cliff of great height. He shot one of the birds, which fell upon the slope, and as it was fluttering towards the precipice, ran to secure it. 'The shepherd was some little distance

behind me, lighting his everlasting pipe; but when he saw me in pursuit of the ptarmigan, he shouted at me to stop: not exactly understanding him, I still ran after the bird, when suddenly I found the snow giving way with me, and sliding *en masse* towards the precipice. There was no time to hesitate, so, springing back with a power that only the emergency of the case could have given me, I struggled upwards again towards my companion. How I managed to escape I cannot tell; but in less time than it takes to write the words, I had retraced my steps several yards, making use of my gun as a stick to keep myself from sliding back again towards the edge of the cliff. The shepherd was too much alarmed to move, but stood for a moment speechless; then, recollecting himself, he rushed forward to help me, holding out his long gun for me to take hold of. For my own part, I had no time to be afraid, and in a few moments was on terra firma, while a vast mass of snow which I had set in motion rolled like an avalanche over the precipice, carrying with it the unfortunate ptarmigan.'

We must now conclude with a very interesting picture exhibited in quite a different department of nature. The subject is the Merry Dancers (*aurora borealis*) and the sound of their petticoats! 'The keeper,' says he, 'told me that when the aurora was very bright, and the flashes rapidly waving through the sky, he had frequently thought that he heard the merry dancers emit a faint rustling noise, like the "moving of dead leaves;" but this was only when the night was quite calm, and there was no sound to disturb the perfect stillness. . . . I was pleased to hear him say this, as I had more than once imagined that the aurora, when peculiarly bright, and rapid in its movements, *did* actually make exactly the sound that he described; but never having heard it asserted by any one else, I had always been rather shy of advancing such a theory. The aurora is seldom seen, or at least seldom attentively watched in this country, in situations where there is not some sound or other, such as voices, running water, or the rustling and moaning of trees, to break the perfect silence: but it has occasionally happened to me to be gazing at this beautiful illumination in places where no other sound could be heard, and then, and then only, have I fancied that the brightest flashes were accompanied by a light crackling or rustling noise, or, as my keeper expressed it very correctly, "the moving of dead leaves." . . . In the northern mountains of Sutherland, where the aurora is frequently very bright and beautiful, there is a fascinating, nay, an awful attraction in the sight, which has kept me for hours from my bed, watching the waving and ever-changing flashes dancing to and fro. I have watched this strange sight where the dead silence of the mountains was only broken by the fancied rustling of the "dresses" of the "merry dancers," or by the sudden scream or howl of some wild inhabitant of the rocks; and I have done so until an undefinable feeling of superstitious awe has crept over my mind, which was not without difficulty shaken off.'

From this rapid survey of the book, the reader will see that it has good matter; although, from the want of common arrangement, he will find it somewhat difficult to make the discovery for himself.

ELIZABETH FRY.

ELIZABETH GURNEY, afterwards Mrs Fry, born on the 21st of May 1780, was the third daughter of John Gurney, of Earlham in Norfolk, a member of the Society of Friends. She lost her maternal parent, a woman of great worth and ability, when only twelve years of age. The family then consisted of eleven children, the eldest of whom was only seventeen. Her feelings of benevolence towards her suffering fellow-creatures appear to have been drawn out in very early childhood, by her being the companion of her mother in her visits to the cottages of their poor neighbours.

In other respects there was nothing striking in her character excepting strong affection, which was particularly called forth towards her parents, and brothers and sisters. When about seventeen, she was seriously impressed with the importance of religion, and both her judgment and conscience subsequently decided in favour of the society to which her family belonged, and of which she afterwards became such an ornament.

She was now enabled to gratify her feelings of benevolence by becoming her father's almoner, and she was never sparing of her own personal sacrifices, both of time and property, for the benefit of others. Though her own education was rather deficient, owing to some want of application in herself, and partly from her general delicate state of health, yet even at this early period of her life she felt the necessity of giving instruction to the humbler classes, as a means of improving their moral condition. To carry out this idea, she taught the poor children in the neighbourhood; and in a short time her school, which was commenced with one little boy, increased to above seventy scholars, and was then held in a vacant laundry attached to their house. The first mention we have of her sympathies being drawn out by the moral degradation of her species, was while on a tour through part of Wales and the south of England, in company with her father and six sisters. When at Plymouth (1798), they visited the dockyards; and she notes in her diary: 'My mind felt deeply hurt on account of the poor sailors and women, of whom I have seen a sad number, and longed to do them good, to try one day to make them sensible of the evil state they appear to be in.'

On the 19th of August 1800 Elizabeth Gurney was united to Mr Joseph Fry, who was then a junior partner in a large mercantile establishment, and she and her husband took up their abode in St Mildred's Court, City. During their residence in this place, their five eldest children were born; and notwithstanding the duties of her family, and the delicate state of her own health, she devoted much time to visiting the abodes of want and misery. Her removal to Plashet, in 1809, was not only more congenial to her feelings, by gratifying her natural love of the country, but opened fresh fields for her benevolence. The change was occasioned by the death of her husband's father, whose country seat it had previously been. She established a school in the neighbourhood, and was looked up to by the poor around as the Lady Bountiful of the place. Even the gipsies, who, about the time of Fairlop Fair, were in the habit of pitching their tents near her house, came under her kind notice; and the pariahs of society heard themselves—many perhaps for the first time—addressed by fair and gentle lips in terms of sisterly sympathy.

But we must now follow her to the principal sphere of her philanthropy—the loathsome and neglected cells of the prison; where her sweet voice was heard whispering to the most abandoned of her sex of a return to virtue and happiness. In 1813, several members of the Society of Friends visited Newgate, to see some felons under sentence of death. These gentlemen were on terms of intimacy with Mrs Fry, and they gave her such a sad account of the state of the women confined there, that she, accompanied by a female friend, Anna Buxton, entered this abode of misery and crime, for the purpose of affording warm clothing to the wretched inmates. Owing to ill health and domestic trials, she did not renew her visits for three or four years; but during that time she was learning in the school of affliction to sympathise even more truly with the sufferings of others. Her next efforts were made in 1817, when she formed a school for the children of the prisoners and the young criminals. In a letter to her eldest sister, she expresses the interest

she took in the cause of these poor outcasts—'My heart, and mind, and time,' she says, 'are very much engaged in various ways. Newgate is a principal object; and I think, until I make some attempt at amendment in the plans for the women, I shall not feel easy; but if such efforts should prove unsuccessful, I think that I should then have tried to do my part, and be easy.' In the spring of this year an association was consequently formed for the 'Improvement of the Female Prisoners in Newgate.' The object of this society was to provide clothing, employment, and instruction for the women. They were paid for their work, and received part of the money immediately, that they might procure any little comfort they needed; the rest was placed in the hands of the committee, as a reserve for future use. This plan was found highly beneficial, by occupying the time which had before been spent in gaming, drinking, and quarrelling.

Before these steps were taken, however, the city authorities were consulted. They expressed their approbation of the plans, but looked upon their realisation as hopeless, thinking that the prisoners would never be brought to submit to the restraints which such a change must impose upon them. But Mrs Fry collected the women together; and after having pointed out to them the advantages of industry and sobriety, and the pleasures of conscious rectitude—at the same time contrasting this picture by their own direful experience of the misery of vice—she told them that the ladies of the committee had not come to command their obedience, but had left their homes and families to in-treat them for their good. She then asked if they were willing to act in concert with them, assuring them that not a rule should be made without their entire and united concurrence. Each rule was then put separately to the vote, and such was the effect of gentleness and reason even upon minds so untractable, that they were all unanimously carried.

Hitherto, a scene of riot and confusion had occurred on the occasion of removing the female convicts from Newgate in open wagons. The common sense of Mrs Fry revolted at this indecent exhibition, and she suggested that the removal should take place privately by means of hackney-coaches. The governors having acceded to the proposal, the experiment was tried, and it proved perfectly successful. When on board, Mrs Fry and the ladies of her party examined into the accommodation, and made many wise arrangements for the voyage; among others, materials for work were provided, which was to be sold for the benefit of the convicts on reaching the place of their destination. This was of more essential service to them than she was then aware of, for she afterwards learned from the chaplain of the colony at New South Wales that there was at that time no asylum provided for them on their arrival. A building has since then been erected, and many proper arrangements made for the preservation of the morals, and for the comfort of these unhappy beings.

In August 1818, Mrs Fry journeyed into the north of England and Scotland, accompanied by her brother Mr Joseph J. Gurney. They made a close examination into the state of the prisons in their route, and Mr Gurney published an account of these investigations, and laid before the magistrates at the various places a statement of facts, pointing out to them modes of improvement, which were in most instances adopted. Two years after, Mrs Fry took another journey into the north, and in many places was able to form committees of ladies to visit the female prisoners in their own county jails. 'The British Ladies' Society for Promoting the Reformation of Female Prisoners' was instituted soon after. Its object was to unite these branch societies in one body, that there might be systematic effort in the good work. This association has proved highly beneficial in many ways, by establishing houses of shelter for discharged prisoners who had no homes, and affording relief, part in the shape of a loan, and part as a gift, to such as were willing to earn an

honest living by their own exertions: also by founding schools of discipline for female vagrants and juvenile offenders, &c. &c. In the summer of 1824, in consequence of ill health, Mrs Fry made a stay of several months at Brighton. While here, she was much interested in the state of the poor around—both that of the numerous beggars and the resident poor in the neighbourhood. She had, a short time before, consulted with Dr Chalmers on the best method of assisting this class, and was therefore in some measure acquainted with his views: she now directed her attention to the subject, and 'District-Visiting Societies' were in consequence set on foot, to examine into and relieve real cases of want.

Her illness was attended by frequent attacks of faintness in the early morning, and she was at such times carried to an open window for the influence of the fresh breezes. The coast was visible from her chamber, and as she sat and watched the first gray streaks of dawn over the foaming ocean, or gazed on the dreary cliffs before her, only one living object was present to her view. This was the coast-guard, who paced with measured step the lonely beach. Her thoughtful and ever-active benevolence suggested means of benefiting these men, who were in a great measure shut out from intercourse with their fellow-creatures. One day, when passing near one of the stations, she ordered her coachman to stop, that she might make inquiries into their general condition. The man addressed, however, politely told her that he was not allowed to hold communication with any one whilst on duty. Fearing that this short colloquy might therefore bring him into trouble, she gave him her card, telling him to present it to his commanding officer. A few days after, the lieutenant in command called upon her, and offered to answer any inquiries. He informed her that the coast-guard were subject to many dangers and privations, being exposed to all weathers, as well as to the violence of the smugglers. She at once provided those in the vicinity with Bibles, and afterwards made strenuous efforts to obtain libraries for the use of all the men thus employed. She saw that the loneliness of their situation, and the absence of proper subjects for thought, together with their contact with lawless smugglers, must of necessity produce idle habits and fierce manners; and that, to prevent this moral evil, it was requisite to provide wholesome food for the mind. In consequence of her representations, a committee was formed for this object, and by means of a liberal grant from the government, and various subscriptions, upwards of 21,000 persons were supplied with religious and instructive books; 498 libraries were established for the stations on shore, containing 25,896 volumes; 74 also for districts, comprising 12,880 volumes; 48 others for cruisers, composed of 1867 volumes, beside 5357 numbers of pamphlets, and 6464 school-books for the use of the children of the crews; making a total of 52,466 volumes.

In 1835, Mrs Fry accompanied her husband on a journey into the south of England; and, as usual, it furnished objects of interest for that strangely active mind, which found 'sermons in stones, and good in everything.' When passing over Salisbury Plain, she noticed the monotonous life led by the numerous shepherds, and the thought suggested itself that libraries would be equally useful to them as to the coast-guards. She therefore stopped a short time at Amesbury, in order to form a library there; and the following letter, which was written a few months after by the person who had the charge of the books, will show the success of the plan:—'Forty-five books are in constant circulation, with the additional magazines. More than fifty poor people read them with attention, return them with thanks, and desire the loan of more, frequently observing, they think it a very kind thing indeed that they should be furnished with so many good books, free of all cost, so entertaining and instructive these long winter evenings.'

At Falmouth she witnessed the arrival and departure of different vessels and packets, and her benevolent

heart again pointed out the benefit to be derived from books, especially to those who have much time unemployed. By the co-operation of friends, chiefly the captains of the vessels, and generous grants from different societies, she was enabled to see this deficiency supplied, each packet being furnished with a box containing thirty volumes, which were changed from time to time. Captain Clavell kindly undertook the charge of this library, and one of his family sent the following account of it to Mrs Fry:—'Our library is getting on with much success: the men appear more anxious than ever to read. I cannot tell you how much we all feel indebted to you for your kindness and benevolent exertions, but particularly our poor sailors.' At a later period:—'I have delightful accounts from all the packets: the men really beg for the books. I wish I could show you a box just returned from sea; the books well thumbed, a proof, I should think, of their being read.'

Another object of interest to her was the naval hospitals; and by her influence libraries were introduced there likewise. Nor must we omit to mention the reading-room and library she formed, a short time before her death, whilst staying at the little village of Cromer for change of air. This was for the use of the fishermen in the neighbourhood, to draw them from the public-house; and though it was but a small experiment, it was entirely successful, and is full of encouragement and instruction to those who seek, on a larger scale, the deliverance of their fellows from the bonds of vice and idleness.

Mrs Fry had at this time the gratification of receiving numerous letters from officers of the coast-guard stations, informing her of the good resulting from her labours in this way. She had also many written expressions of gratitude and affection from the poor prisoners in Newgate, as well as cheering intelligence from New South Wales, several of the convicts having sent letters of thanks to her for the instruction she had given to them, and for the kind interest she had taken in their welfare. These things greatly encouraged her in her arduous undertakings, and showed that she had not mistaken her mission, though, in fulfilling it, she was obliged in some instances to step out of the conventional rules of her sex. She had much to endure from the narrow prejudices of some, and the illiberal judgment of others. Her noble self-sacrifices were attributed to low motives, and she was even charged with a neglect of her home duties. All this, however, was of little moment, for it could not overturn the obvious and practical results of her labours. If Mrs Fry had preferred the opinion of the world to the divine spirit of philanthropy which impelled her from within, she would have continued to dance and sing at least as long as the sun of life shone.

In 1828, a house of business in which Mr Fry was concerned failed. It was not the one which that gentleman personally conducted in St Mildred's Court, but it occasioned a loss so serious to him, as altogether to change the circumstances of the family. They were now obliged to give up Plashet House, and all the luxuries of affluence, and remove, after a short stay in London, to a comparatively humble dwelling in the vicinity of their late abode. The chief cause of regret to Mrs Fry arose from the fact of her being now unable to render assistance to the poor around, who had so long looked up to her as their friend, and being obliged also to withdraw her support from her school. Much sympathy was expressed in this hour of trial by those who had united with her in her labours of love, and many gratifying testimonies of esteem and affection were presented. Notwithstanding the diminished resources of this remarkable woman, she continued to devote her time to the cause so near her heart. In company with one or other of her brothers, she made fresh tours into Scotland and Ireland, and afterwards extended these journeys to several parts of the continent. Their object was not only to inspect the prisons, but also the lunatic asylums, national schools, and hospitals,

which were equally in need of improvement; and a vast amount of good resulted from their labours. Our limits will not allow of our entering into details respecting these journeys; but Mrs Fry and her brothers made personal appeals to the sovereigns of England, France, Holland, Belgium, Denmark, Prussia, Hanover, and others, on behalf of suffering humanity. Nor did they forget the claims of the poor slave, but remonstrated with these exalted individuals on their countenancing the slave-trade in their colonies. They were received with courtesy, and many of their suggestions adopted. None could listen to Mrs Fry's simple eloquence, bold in its truthfulness, yet breathing the very soul of love, without being touched by it. The monarch felt that the beauty of sincerity surpassed the homage of the courtier; and the hardened heart of the criminal melted under the gentle influence of her nature, and felt the loveliness of virtue. That she experienced no self-exaltation at the universal respect which was shown to her, is obvious from many passages in her diary. At one time she says—'I have fears for myself in visiting palaces rather than prisons, and going after the rich rather than the poor, lest my eyes should become blinded, or I should fall away in anything from the simple, pure standard of truth and righteousness.'

Fatigue of body and mind had long been weakening her health, and in July 1843 her friends became alarmed. This illness continued, with short intervals of amendment, until October 1845, when her earthly career ended. All that affection could devise was done for her: she was taken from one watering-place to another; but nature was exhausted. In her sixty-sixth year she breathed her last at Ramsgate, deeply lamented not only by all who were bound to her by the ties of kindred, but by thousands whom her philanthropy had assisted, and her virtues had attached to her. When estimating the success of her labours, something must be attributed to the general spirit of improvement of the age; yet surely much praise is due to those individuals who nobly pioneer the way. At the time that Mrs Fry entered this field of labour, the prisons were in a lamentable state. Various causes had operated to destroy the good which Howard had laboured to effect, and the acts of parliament which were passed in consequence of his exertions had become a dead letter. The ground had therefore, as it were, to be trodden afresh, and for this work Mrs Fry was eminently qualified. Her warm, loving heart embraced the whole human family; but her chief object was to stretch forth the hand of encouragement to those of her own sex who were sunk in vice and misery, and to lead them to virtue and happiness.

ANECDOTE OF ALBONI.

Nor very long since there resided at Bologna a gentleman worthy in character, but of somewhat eccentric habits, whose age might be about forty-five. He had obtained a certain degree of celebrity in the musical world; his name was Rossini. Partial to tranquillity, good cheer, and solitude, his door for some years previous had been closed against a particular class of visitors; his *conciierge* having received directions not to admit any lyrical composer—a little farther, and he might have written on the walls, 'No musician enters here.' Despite these injunctions, a young damsel one morning glided into his presence, bearing a letter of introduction. Rossini was furious, but his better feelings prevailed.

'What is your pleasure, mademoiselle?' asked he.

'To sing before you, monsieur, and to solicit your advice.'

'Eh, my poor child, you wish to sing? Why, no person sings now-a-days.'

'I have, however, a tolerable voice.'

'Pauvre petite! At her age doubts never intrude. Let me see; what can you sing—contralto or soprano?'

'Both, monsieur.'

'How! Both?'

'Certainly: anything you wish.'

'Do you know "Il Barbiere?"'

'By heart: I shall sing, if it pleases you, the air of Rosina and the *morceau* of the Calumny.'

'Ah, ah! the young rogue is merry,' muttered the composer, patting her cheek. 'What is your name?'

added he.

'Marietta.'

'Well, Marietta, open the piano, and sing whatever you choose.'

The young girl sat down, and accompanying herself, sang the grand air of Basile with the greatest steadiness and accuracy. Rossini was confounded. Without taking time to repose herself, she sought amongst the music ranged on the *pupitre*, and selected the air of Mathilda in 'Guillaume Tell,' which she executed with inconceivable expression, and with the same faultless precision as the former.

'The organ is superb!' exclaimed the composer, affectionately shaking her hands; 'but it must not remain idle. Study and sing, and heed not what persons say or do around you.'

This young girl, whose *début* in the arts was mainly owing to the undeviating kindness of Rossini, is the same who, a short time since, completely revolutionised the musical world of Paris. Her name is Alboni; the most extraordinary songstress, with the exception of Jenny Lind, that has been heard for thirty years.

Mademoiselle Alboni's character is a compound of winning frankness and strange caprice. Devoid of that self-love so common to other *artistes*, she willingly suits herself to any part assigned, provided the melody is such that she can do it justice.

She has often been compared to a German student, having all the *sang-froid* and courage usually attributed to that class. An amusing incident which occurred during her stay at Trieste is thus related:—Having heard on the day of her arrival that a cabal against her was being organized, she wended her way to the *estaminet*, and mingled amongst the conspirators; her short locks, full figure, and *dégagée* air, rendering it difficult to divine her sex.

'I am a stranger,' said Alboni, addressing herself to the Brutus of the cabal; 'but if there's fun on hand, count upon me.'

'Agreed!' was the reply. 'We are preparing to hiss down a cantatrice this evening.'

'What has she done—anything wicked?'

'We know nothing about her except that she comes from Rome, and we wish to have no singers here of whose reputations we are not the creators.'

'That appears to me fair enough: now as to the part I am to take in the affair?'

'Take this whistle; each of us carries a similar one. At a signal which will be given after the air of Rosina in the "Barber of Seville," you have but to add to the tempest which will be raised.'

'I comprehend;' and Alboni, faithful to her disguise, received from the hands of her dupe a pretty black whistle attached to a red ribbon.

That night the theatre bent under the weight of spectators. At the rising of the curtain, Almaviva and Figaro, two favourites, were listened to with attention; but when Rosina appeared in the scene in which she addresses the jealous tutor, a half-dozen whistles sounded their shrill notes through the house, unmindful of the signal to be given by the leaders of the cabal.

Alboni advanced to the foot-lights, and displayed the whistle suspended round her neck. 'Gentlemen,' said she with a smile, '*we must not hiss me, but the cavatina; you have commenced too soon!*'

There was a moment of silence; then thunders of applause rang through the house. The cantatrice was that night recalled eleven times amidst showers of bouquets.

'I had no idea that you were aware of this cabal?'

said the director after the performance, as he kissed her hand.

'My dear *impressario*,' replied she, 'it is here as in politics—you must conduct the movement, or else be swept away.'

A STORM IN THE BALTIC.

SOME years ago, during a temporary residence in the small island of Sylt, on the coast of Schleswig-Holstein, I had an opportunity of witnessing the effects of a storm in the Baltic, of which I had often heard very strange things stated.

The season was autumn, and the weather had become broken and unpleasant. At length we had a day of incessant rain, accompanied with a gale which blew with considerable fierceness. Next day matters seemed approaching a crisis. The storm had fairly commenced operations. I shall never forget the scene which now presented itself. At the beginning of the hurricane, all the trees in the island were in full leaf, though tinted with autumnal hues. When the storm was over, vegetation seemed to be destroyed, the leaves being blackened and withered on the branches, and in a few days more, I was told, they would all fall off. Only a few, which had occupied peculiarly-sheltered positions, remained undestroyed; while some that the wind had whistled through in a particular direction had the one-half of their leafy crowns left as black as a coal, and the other quite uninjured. It was really a pitiful sight: one could almost fancy the wind must have had a poisonous breath. But the effect proceeded, it was said, from the long-continued violent shaking, which hindered the proper circulation of the juices, just as a human creature might be shaken to death; yet in the inland parts of Germany and in England trees are often shaken by the wind for days together without any such fatal consequence, and many of their coasts are as much exposed to gales from the North Sea. Can this injurious action take place only from the west? The first that went were, I perceived, the leaves of the chestnut trees; then followed the limes; and lastly the poplars and the willows. Those that endured it best were the black-thorns; and it is natural that the larger the leaves, and the more firmly attached to the branches, the more they suffer. Those of a long narrow shape, or which are very small and limp, yield more easily to the storm, and feel it less.

When the wind had lasted a short time, the windows became covered with a coat of fine salt, like hoarfrost, and the lips and skin also acquired a salt taste. At the back of the house where I was staying there were some swallows' nests, in which the young ones now began to make a most pitiful and unusual noise. On going to see what was the matter, we found them all stretching their necks out of the nest, and the old birds flying a little way off, screaming, and evidently in great distress. It appeared that the violence of the wind prevented the parents from flying out in search of insects, and that they were consequently suffering from hunger. Our good-natured hostess, however, took pity on them, and chopped up a quantity of meat and bread crumbs to feed them till the storm was over. But it was not enough that this fierce gale should destroy the leaves and starve the birds: it had worse things in store for us.

On the second day we suddenly became aware, to our dismay, that the white surf, which we had been admiring, as it broke at some distance on the shore and the sandbanks, was now dashing up in the middle of the island. The sea had risen and covered the marshes, and towards evening a swift stream was rushing through the most fruitful part of the island, which unluckily was the lowest, and cutting it into two divisions, having opened a passage for itself from one bay to another.

The raging storm had lashed up the waters to such a height, that we could not distinguish whether the tide was in or out; it seemed to swell as much at ebb as at flood. The inhabitants of the island, not expecting such

a storm as this in the summer, had left their flocks out on the pastures, and it now became a question how to provide, if possible, for their safety.

The flooded country, which we were anxiously contemplating through the telescope, presented an interesting spectacle: the dark-gray waters were rushing in various directions across it, and leaving only numerous strips and patches of green visible, as far as the high *geest* land against which they were breaking. The cattle, horses, and sheep were crowded together on the spots still left for them; and the composed manner in which they were feeding formed a striking contrast to the excitement and agitation of their masters. It not unfrequently happens, indeed, that the people lose their lives in attempting to save those of their flocks. As night came on, the gale seemed to grow even fiercer, and it now became decidedly necessary to go to the help of some of the sheep.

I joined one of the men who were going out for this purpose, and we walked along towards the inner Hoff, where we hoped to be able to cross to where the animals had taken refuge; but we found an arm of the sea, which was rushing across with great fury. It was impossible to go that way, and we sought another passage, and got on some distance towards them by wading; but we soon found the water getting so deep, that we were compelled to give up our intention. The poor man was in a state of the greatest alarm—not for himself, but for his sheep; indeed our danger was no more than just sufficient to create a pleasant excitement: the sky was covered with clouds, and sea and land seemed mingled together in the thick darkness. As we passed along the edge of the *geest*, or high heathy land, we perceived on the little border of reeds around it that the water was lower than it had been; and at midnight the shepherd went out again, as he said if his sheep were drowned, he should still perhaps be able to save their skins. This time, however, I was not his companion; another man went with him, and I returned and passed the remainder of the night in smoking, and listening to my host's stories of perils in the great deep. His house, fortunately for us, lay very high, on a tongue of firm *geest* land.

On the following morning we heard much of the sufferings of the night. One of the islanders had lost ten sheep, one thirteen, another his whole flock; and the bodies of many were carried in mournful procession into the village. I could not help, however, admiring the patience of the people. There was no loud complaining, and still less any cursing; but all showed sober patience and resignation, although their sheep are almost their only possessions. Several vessels had been wrecked in the night on or near the island, and indeed we had heard guns fired, but had no means of giving assistance.

As we rode along the shore we passed two of the wrecks. The crews of these had got safe to land; and the captain of the one, still dripping wet, was standing answering a long string of questions put to him by the *strandvoegt*, or steward of the shore, who was driving about the sands in a little light one-horse carriage, with wheels of three yards' diameter. 'Whence had he come? What was the name of his vessel? What was his cargo? Why he was lying there? How came he to go ashore?' &c.; though the still howling wind might perhaps have answered the two latter questions for him. At a short distance further on we found the next wreck. It was a little Dutch vessel; and, like other aquatic creatures, the captain had made himself quite at home on the waves: he had had his wife and baby on board. These had been deposited safely in a cottage; and the father, a grown-up son, and a boy, were busy getting what they could out of the wreck. Here lay a little iron stove; there a blue-painted corner cupboard, a copper tea-kettle, and a china teapot, with cups, &c. thereunto belonging, besides a tub of butter, a cheese, and an old loaf. Sometimes one of them would return with nothing better than a pair of trousers, a

tumbler, or some little garment of the baby's; but they continued their work, though the sea was still breaking over their vessel, so that they got many a shower-bath.

A little farther on we came to a large mast that had evidently been cut away. The marks of the hatchet were still fresh upon it; but of the vessel to which it had belonged there was not a trace. Probably it had gone entirely to pieces, and the crew been scattered like chaff before the wind.

THE ICARIAN PARADISE LOST.

For a number of years, a M. Cabet in Paris carried on a delusion which has ended as badly as all knew it would, the dupes of the delusion alone excepted. Whether M. Cabet was a rogue or a fool, or a mixture of both, is a matter of little consequence. He was one of those men who alleged that the competitive system of society is all wrong, and that Communism, or a general partition of goods in common, is the only means of earthly happiness. In order to practise what he preached, he induced a large number of credulous people to make an investment in an American Utopia called Icaria, to which they proceeded in shiploads by way of New Orleans.

It always appeared to us that Icaria had no real existence, but it now seems to have a locality somewhere in Texas; and here, on this happy spot, Communism was at length to have a fair start. Alas! evil tidings have reached France respecting the Icarians; and M. Cabet is denounced as a most perfidious individual; though he still carries on his plans, and is not without supporters among the Red Republicans. Let the following account of Icarian affairs, transcribed from the 'Journal des Débats' and other papers into the 'Times,' not be lost on those who give ear to schemes for reconstructing society:—

'Several articles in the American papers, and some letters that we have partly republished, have made our readers acquainted with the fate of the unfortunates who, excited to fanaticism by the doctrines of M. Cabet, had the deplorable temerity to abandon their homes, their trades, and their families, to go and found in the solitudes of the New World the Paradise of Icaria—that "new Jerusalem" whence were to arise the salvation and happiness of the human race. We thought these afflicting disclosures would have provoked explanations, or at least a reply, from the man who is accused as the author of so many misfortunes; and without really yielding any credence to the extravagant and immoral Utopias of M. Cabet, we hoped that he would at all events be able to prove that these deplorable narratives were exaggerated. We were deceived, however, and we still wait—for we cannot view as serious the letter addressed to several of our contemporaries by forty-nine adepts of the Icarian doctrines, who protest, in the most vague, but violent terms, against those whom they call traitors. We certainly do not question the good faith of the subscribers of this letter, but they must have been aware that abuse is no answer to precise and definite accusations, and that they ought, for the honour of the school, to have opposed to the facts specified allegations no less positive.

'As for M. Cabet, he keeps aloof, just as if he were a party not concerned in the matter at all. Disdaining to reflect on such miseries, he continues his labours with the same ardour as before, and if we are to believe public report, he is still urging the departure of new colonists—that is to say, of new victims for his chimerical Icaria. We have no power to prevent these unfortunates from rushing to their ruin; we know of no other available jurisdiction in this affair than that of the press; but we deem it our duty to lay before the public such facts as have come before us, in order that the tribunal of opinion may be in a position to pronounce, with a full knowledge of the circumstances, on the merits of the Icarian doctrine and its prophet.'

Were anything wanting to substantiate the intelligence of the utter ruin of Icaria and its victims, it would be found in what follows from the 'Echo of Louisiana' of November 29:—

'Thirty more colonists arrived from France last Sunday, to re-establish the republic of Icaria. The blindness of these poor people is truly incomprehensible; for our readers are aware that all those who reached the promised land have been obliged to abandon it, and have succeeded with great difficulty in regaining our city, the majority being reduced to the greatest distress.

'These new-comers have met those who preceded them, and the latter have given them a sad description of the dreadful state to which they would be reduced if they continued their journey to Texas. You perhaps imagine that this gloomy account frightened the new colonists. By no means! These unhappy wretches must have been fanaticised by M. Cabet. It is in vain to point out to them the emaciated and ragged ex-emigrants in question, or to urge them to halt—go they will, and nothing will stop them! They do not believe the assertions of their old companions; and the picture of the sufferings which await them is regarded as a frightful falsehood, invented by paid agents of the French government, in order to prevent the foundation of the Icarian colony.

'Poor idiots! Some of them, however, have come to the conclusion that there may be some truth, after all, in these narratives; for if Icaria were a country of eternal felicity, why should their predecessors have left it to come and die of starvation at New Orleans? Many would have gladly remained, but before sailing, they had been so simple as to confide their money to the agents of M. Cabet, and they wished to recover at least a part of it. The purse of M. Cabet, however, is a gulf far more profound than that of the ocean on which his adepts are wafted to the scene of his delusions. Never has a single one of the one hundred sous pieces, of which the worthy high priest of Icaria virtuously deigns to despoil his victims before sending them to the promised land, been returned to the pockets of the owner.

'As to the unhappy chosen ones who have reached this land of enchantment, they in vain consign M. Cabet to perdition. M. Cabet seems to pursue his career in France notwithstanding, despatching fresh recruits after having despoiled them like the rest. His only occupation is to obtain as many as possible, to accompany them to the place of embarkation, and to give them his paternal blessing. As soon as the sails are set, Cabet exclaims—"Ite missa est!"—"Go, the farce is played!" He then returns to Paris, and eats and drinks to the prosperity of the happy Icarians whom he has just despatched to starvation in the backwoods of Texas. In our opinion, M. Cabet alone can claim the pompous title of "the first Robert Macaire of transportation."

'The first victims that he has despatched to us did not obtain a single sou to remain here, and they then decided to push on to Texas—a further instance of insanity in our opinion. They did not reason; their faith in Cabetism is perfect.

'What! They are running to Icaria, where they know that distress awaits, and will be fatal to them, if it do not drive them back again more miserably than ever. And wherefore? To get back their money? Not so; for they are aware that all is lost. No matter; they are setting out for Icaria; so stick a pin there.

'If these unfortunates had reflected a little, they would have seen that they must make the best of the deceit thus practised upon them; and if they had set to work, they would have made another fortune, instead of going to endure acute sufferings for twelve weeks, and then returning hither sick and destitute.

'One of them, a member of the second vanguard, and who has now (as he poetically expresses it) had his bellyful of Communism, informed us that there was no slavery to equal Communism in action. No idea can be formed of it: for example, there is not soup enough for everybody; so it is given to the dogs, in order that no jealousy may be excited amongst the Socialist guests! At table, each individual watches—not his own plate, but that of his neighbour, and generally discovers that the pittance of the latter is larger than his own! Each must have the same appetite and the same tastes, for the morsels of food are weighed and measured, and all must eat of the same dish. So much the worse if you have a keen appetite, for you have only your own portion; whilst those (a rare occurrence amongst the Communists) whose stomachs are not so sharp-set, throw the superfluous part of their provender to the dogs, for the same reason as before—to prevent jealousy. "We were told," added our friend from Icaria, "that Icaria was a wonderful city, which utterly distanced Paris and Capua in luxury and sensual gratifications. When we arrived, however, we only found a few huts, open to all the winds of heaven and all the inclemencies of the weather. Thousands of acres of land were to have been sown—so we were told. But what was the fact? We found fifty square leagues of ground, in which they had planted five hundred

radishes, of which not a single one appeared above the soil!" Such is Icaria. It is the pendant to the Botany Bay of Great Britain; with this difference, that instead of transporting thieves thither to live, they send out plundered dupes to die.

"Such was the account given by our ex-Communist of this promised land. What a picture!"

TRIFLES.

ONE Saturday night we listened to a very amusing discourse, the tendency of which was to show, that although no one should be a trifler, yet that every one should be attentive to trifles. A trifler was defined to be one who habitually gives up his time and attention to things that are, or that ought to be, beneath his notice; while a trifle was said to be something insignificant in itself, yet capable of producing important results. By way of illustration, an incident in the life of Laffitte, the great French banker, was quoted. Laffitte, in 1787, entered Paris as a poor peasant boy: his introduction to that career in which he was afterwards so eminently successful was owing to a mere trifle. M. Perregeaux, to whom he applied on his arrival for employment, at first rejected his suit; but on seeing the youth, while crossing the courtyard of the hotel, disappointed and rejected, suddenly stop, pick up a pin, and carefully stick it in the cuff of his coat, the man of money was moved, the petitioner was recalled, and after a few minutes' conversation, appointed to a vacant post in the office. In 1804 Laffitte became the partner of Monsieur Perregeaux; and subsequently obtained the entire direction of the bank. After enjoying the highest civic honours of his country, he died a millionaire in the year 1844; owing his extraordinary success in life, probably, to the habit, early formed, of never neglecting the most trivial thing likely to be useful.

The falling of an apple from a tree is said to have occasioned the discovery of the laws of gravitation: apples had fallen many many times, no doubt, before Sir Isaac Newton seated himself in his arm-chair in his orchard; but until that afternoon, it would seem that no one accustomed to regard even trifles with attention had noticed the circumstance. "History, if referred to," said the lecturer, "would afford numberless instances of the veriest trifles producing peace or war, entailing prosperity or adversity for whole generations." As an instance how far even civilisation is affected by trifles, an anecdote from Sir Francis Head's narrative of his governorship of Canada was cited. "At a certain season of the year," continued the speaker, "if my memory serves me, Sir Francis Head says that a little fly appears upon the prairies, and torments the wild animals there terribly. To escape its sting they flee to the forests, and hide in its recesses; the Indian follows, and to drive out his game, sets fire to the underwood. He obtains his venison and buffalo hump, but loses his hunting-ground; for as the land is thus cleared, the white man advances, and his red brethren are compelled to retreat further before him."

The lecturer next touched upon the influence of trifles in promoting or destroying domestic happiness; and concluded by explaining a few such phrases as: a man ought to be above trifles, &c. B—Y.

[We take the above from an interesting little paper called the *Queenwood Reporter*, published periodically at Queenwood College, near Stockbridge, Hants, and which purports to consist of articles written by the pupils of that establishment. We have heard much of Queenwood, as agreeably uniting the character of a home with that of a public academy for boys.]

MINERAL CAMELEON.

If one part of the black oxide of manganese, and three parts of the nitrate of potash, both reduced to powder, be mixed together, and thrown into a red-hot crucible, and continued there until no more oxygen gas is disengaged, a greenish friable powder is obtained called *mineral camelion*, from its property of changing colour during its solution in water. If a small quantity of this powder be put into a glass of water, the solution is first *blue*; oxide of iron then separates, and by its *yellow* colour renders the fluid *green*; this subsiding, the *blue* reappears; then, as the oxide of manganese absorbs oxygen from the atmosphere, it becomes *reddish, brownish*, and at last *black*. It then subsides, and leaves the fluid *colourless*. Again, if *hot* water be

poured upon this singular substance, a beautiful *green* solution will be produced, whereas *cold* water will give one of a deep *purple*. These changes depend upon the various states of oxydization which the metal acquires by change of temperature. In the first formation of this compound, care should be taken that no sulphur comes in contact with it; as the addition of a very small portion of sulphuret of potash would counteract its effects.—*Parkes's Chemical Catechism*.

SONNET.

Who hath not treasured something of the past—
The lost, the buried, or the far away?
Twined with those heart-affections which outlast
All save their memories—these outlive decay!
A broken relic of our childhood's play,
A faded flower, that long ago was fair—
Mute token of a love that died untold!
Or silken curl, or lock of silvery hair—
The brows that bare them long since in the mould!
Though these may call up griefs that else had slept,
Their twilight sadness o'er the soul to bring;
Not every tear in bitterness is wept,
While they revive the drooping flowers that spring
Within the heart, and round its ruined temples cling.

J. CRAIG.

INVENTION OF SUSPENSION-BRIDGES BY THE CHINESE 1600 YEARS AGO.

The most remarkable evidence of the mechanical science and skill of the Chinese at this early period, is to be found in their suspended bridges, the invention of which is assigned to the Han dynasty. According to the concurrent testimony of all their historical and geographical writers, Shang-leang, the commander-in-chief of the army under Kaou-tsoo, the first of the Hans, undertook and completed the formation of roads through the mountainous province of Shen-se, to the west of the capital. Hitherto its lofty hills and deep valleys had rendered communication difficult and circuitous. With a body of 100,000 labourers he cut passages over the mountains, throwing the removed soil into the valleys, and where this was not sufficient to raise the road to the required height, he constructed bridges, which rested on pillars or abutments. In other places he conceived and accomplished the daring project of suspending a bridge from one mountain to another across a deep chasm. These bridges, which are called by the Chinese writers, very appropriately, 'flying-bridges,' and represented to be numerous at the present day, are sometimes so high, that they cannot be traversed without alarm. One still existing in Shen-se stretches 400 feet from mountain to mountain, over a chasm of 500 feet. Most of these flying-bridges are so wide, that four horsemen can ride on them abreast, and balustrades are placed on each side to protect travellers. It is by no means improbable (as M. Pauthier suggests) that, as the missionaries in China made known the fact, more than a century and a-half ago, that the Chinese had suspension-bridges, and that many of them were of iron, the hint may have been taken from thence for similar constructions by European engineers.—*Thornton's History of China*.

TIME.

In all the actions which a man performs, some part of his life passes. We die while doing that for which alone our sliding life was granted. Nay, though we do nothing, time keeps his constant pace, and flies as fast in idleness as in employment. Whether we play, or labour, or sleep, or dance, or study, the sun posts on, and the sand runs. An hour of vice is as long as an hour of virtue. But the difference between good and bad actions is infinite. Good actions, though they diminish our time here as well as bad actions, yet they lay up for us a happiness in eternity; and will recompense what they take away by a plentiful return at last. When we trade with virtue, we do but buy pleasure at the expense of time. So it is not so much a consuming of time as an exchange. As a man sows his corn, he is content to wait a while, that he may, at the harvest, receive with advantage.—*Owen Feltham, 1636*.

MOVERS AND RESISTERS.

WE lately endeavoured to trace the natural bases of political partizanship in certain characters of mind. We may now go on to remark that the same peculiarities of temper and thinking which determine for a man which colour he is to wear at elections, or on which side of the House of Commons he is to take his seat, rule his choice as well in scientific matters. Philosophy has its Whigs and Tories, its Radicals and its Nondescripts; and if doctrines of all kinds were as regularly subjected to votes as is the case with political questions, we should be not less able to foretell the places of our friends in the division list, than the best whipper-in ever was to vaticinate on the fate of any ministerial motion in parliament.

It is a curious circumstance that Resisters of all kinds always believe themselves to be the representatives of the Movers of a former age. The unfortunate Conservatives of the Reform-Bill era went to the martyrdom of their defeat under the conviction that they were the true Whigs of 1688. The modern possessors of that title they held to be a degenerate race, who were seeking to destroy the very fabric which their venerated predecessors had reared with so much trouble and so much wisdom. 'We,' said they, 'though you call us Tories, are in reality the protectors, and, alas! the only remaining protectors, of what the Whigs did in the days of William of Orange.' This was true in the letter; but at a cool moment we must own that it was not true in spirit. Whatever might be the merits of the question so keenly agitated in 1831-2, no reasonable person can doubt that if Somers, and Seymour, and Halifax, had been summoned from the grave to take a new lease of political existence, they would, with the dispositions we know they possessed, have ranked themselves, not beside Sir Robert Peel and Lord Lyndhurst, but Lord John Russell and Lord Durham. To think otherwise is to suppose men more true to a lifeless word or phrase than to their own inborn impulses, which all experience is opposed to. So also in some of the ecclesiastical questions of the last few years, we have occasionally heard the stand-still, or defensive party, referring with pride to great reforming names of a former age as the glory of their cause, when it was more than doubtful whether those reformers, if recalled to life, would have taken their side. The fallacy consists in overlooking the change of ideas and of the relations of things which has taken place since the time of the persons referred to, and in failing to see that these persons, if now alive, would have something to judge of very different from what they had in their own day. If still actuated by the dispositions which they manifested in their former life, they would judge of the matters submitted to them

under the bias of those dispositions, and determine according as these were affected by the new circumstances. Thus we can imagine a great founder of some particular form of external religion, after three centuries, taking part against the very system he had founded, seeing that it did not, in its new relations, fulfil the end he had originally in view. Perhaps, indeed, there is scarcely any such system which would at the end of three centuries obtain the full sanction of the very persons who, at the beginning of the period, were its most zealous advocates and defenders. That duty would in general have to be left to a different class of minds.

One can easily see how precisely it is the same phenomenon, when a stand-still party of scientific men seek to shelter themselves under the prestige of some great man of former days, whose doctrines, originally themselves an innovation, are now predominant. The opponents of the natural classification of plants wielded against it the authority of Linnæus, whose system was so very different. But Linnæus was in his day exactly such an innovator as Jussieu was afterwards. The improvement which he effected was as great as could be expected of any one man in his day; but it was not all that was capable of being made. Much remained to be done, and no one knew this better than Linnæus himself. When Jussieu, passing from the artificial arrangement of the Swedish naturalist, brought plants into the association of their natural affinities, he only took the next proper step in the process. The haters of improvement affected to rally round Linnæus, whose name was a tower of strength. But would Linnæus, if still alive, have stood up for his own system as against that of Jussieu? Very improbable, seeing that his mind was essentially active and progressive, and therefore apt to adopt exactly such novelties as this. We can scarcely, we think, be going far wrong when we affirm that many a man to this day patronises Linnæus in a degree for which that great man would blush were he capable of appreciating the superior system of the French botanist.

Aristotle, as we all know, was at one time a kind of religion to the learned world. When a new system came into notice, it was held as a sort of heresy. Men professed to defend their ancient master, as they would have defended the temples or images of the gods against a barbarian enemy. But no one now-a-days can study the character of the Stagyrte philosopher, and doubt that, if he had lived in the sixteenth century of the Christian era, he would not have been an Aristotelian. Far more probably, he would have defended De la Ramée in the Sorbonne, when that extraordinary genius was seeking to undermine his own method of logic. So, also, when the Cambridge doctors held out for him against Bacon, we cannot doubt that he would have

himself been the leading Baconian. He would have astonished them by giving up his own books. Bacon, again, if now living, would probably be busy with some improvements upon the inductive method; some expansion of it, or some ascension above it, which, were it to be propounded by any nameless man of our day, would, beyond question, be denounced as a heterodoxy with respect to the actual ideas of Bacon.

The fact is, in such cases, minds of very different calibre are concerned. The original mover was a great man; the resisters are small men. The latter can take up an idea, and make food of it, when once it has received a stamp from authority or from age; but they cannot truly judge of it, or of the character of its originator. Had they been his contemporaries, they would have been his greatest opponents and vituperators—resisting the very doctrines which now they hold fast as they would their most valued possessions. It is the fate of the great man to be before his age, of the small men to be behind theirs. The ideas of a great man, at first difficult of acceptance, acquire in time a wide prevalence. They may then be regarded as in harmony with the general mind to which they are addressed. As the general mind advances, they fall behind, and then it is that they become suitable for the tribe of Resisters. Then is the time of the dotage of ideas, and it is of course as absurd to appeal from a new idea to one in this state, as it would be to endeavour to correct a man in the prime and vigour of his days by showing how his bedrid grandfather would have conducted himself in similar circumstances. The true and just appeal is not to what the great man of a former age has said on a particular subject, for everything he has said must bear a character from the circumstances and prevalent ideas of his own time; but to the spirit of the man. We must call into court the Aristotelian mind, or the Baconian mind, as a mere instrument, and endeavour to imagine what would be the tune which would flow from it under the existing circumstances, after it had been duly adjusted to the pitch of a new and advanced age. It is difficult to imagine this. Well, then, put it entirely out of court, and endeavour to decide the question otherwise. But if the great dead are to be brought forward at all, undoubtedly this is the only right way in which they can be brought forward.

Akin to the fallacy here described is that of the applause of bygone times. When he praises some feature of a past age, as a thing whose extinction is to be regretted, because there is nothing now like it, he is usually under a complete mistake. It is only the narrowness of his own judgment which prevents him from seeing that, in as far as any such thing is now needed, its place is filled by something of an analogous or corresponding character, which perhaps serves the end even better. What is more, if this person had lived in the past age referred to, it is probable that the feature which he now deplores as extinct would have affected him disagreeably as an innovation. He only can love it because he cannot see it. On the regret sometimes expressed by romantically-inclined persons for the system of chivalry, we take leave to quote some remarks which appear to us strikingly just:—'To lament its extinction, still more to affect the restoration of its outward semblance, is not only childishly to attempt a reversal of the march of wisely-ordered events, but to militate against the very spirit from which the system attempted to be recorded first arose, and to which, while prevalent, it owed its short-lived existence—the spirit of improvement upon worse manners, and yet

more imperfect institutions of an earlier date. As in every other system in which the better principles imparted to man have been more or less perverted by his weakness, his ignorance, his attempt to restrict that which was intended to be universal, and to individualise that which was destined for the common good of all—whatever was worth preserving in those days, to which some even in the present time are fond of reverting as the epochs of the truest glory of our race, still lives among us—lives a nobler and more vigorous life. It is but the false and the imperfect, the vain and the useless, the deceptive and the dangerous, which has been irrevocably swept away. In return, therefore, to the lament that the age of chivalry is gone, we may truly reply that we have a better and a nobler chivalry of our own—a chivalry which, if it watches no more in steel, and wields no weapons of mortal warfare within the field of actual contention, has its vigils and struggles yet more painful in their character, and undertaken for a far higher end—which, if it no longer traverses sea and land, the tempestuous ocean and the parching desert, to seek

"In Calvary Him dead who lives in Heaven,"

often goes forth into painful exile in lands yet more remote—or, nearer home, confronts the ghastliness of misery and the perilous atmosphere of contagion and death, to multiply living monuments to the common Lord of Christianity in the recovering from crime and ignorance, from anguish and disease, those over whom—as far as their improvement, whether mental or physical, is concerned—every revolution of society has hitherto passed almost in vain—which sees, moreover, in difference of faith or of nation, no longer, as formerly, fresh pretexts for warfare and extermination, but rather motives for closer intercourse, and a wider exercise of the common law of charity and love.*

The characters of men might be regarded as so many casts from a certain number of moulds. The individual men change in generations; but the moulds remain, and the characters accordingly are continually reproduced. Two similar events, or relations of circumstances, in two distant ages, are surrounded by perfectly similar characters, though by different flesh and blood. Let there be a persecution for opinion in our age, and men precisely corresponding to the distinguished inquisitors of old, and to all their subordinate instruments, would immediately appear. Let there be a new attack on France in circumstances precisely similar to those of 1792–3, and we should have a new Robespierre and Marat, a new set of Girondins, and finally, when the crisis was nigh past, a new Tallien and Barras. In the recent Revolution, the men whose character would have fitted them for a Committee of Public Safety have been, under the totally different direction which things have taken, remanded to the obscurity of the Parisian jails, instead of being drawn on to dictate who should live and who should die. In his play of the 'Baptistes' George Buchanan introduces two Pharisees, Malchus and Gamaliel, who do the hero to death on fallacious grounds which may be supposed. Without in the least violating the truth of the picture, the poet is understood to have described under these names two of the leading doctors of the ancient faith of his own day—the kind of men by whom Hamilton and Wishart in Scotland, and

* From a paper recently read before the Literary and Philo-
sophical Society of Leicester, by J. F. Hollings, Esq.

Cranmer and Latimer in England, were adjudged to the flames. In our age, we have no such fierce controversies going on, and no such tremendous punishments for opinion inflicted; but amidst those which we have, it is not difficult to distinguish the Malchuses and Gamaliels, or the men at least who would fill those parts if the times were in a temper to call them into full development.

THE GOLD-SEEKER AND THE WATER-SEEKER.

A MEXICAN NARRATIVE.

BY PERCY B. ST JOHN.

At no great distance from the city of Chihuahua, in a vast plain, is a small village in the centre of a deep wood, almost wholly unknown save to the wandering hunter, and the few inhabitants who dwell in its poor huts. It is called Torpedo. Twenty sheds, with roofs, it is true, but with scarcely any walls save on the northern side, composed, with one exception, the small hamlet. A neat wooden hut stood aloof from the rest, marking an advanced degree of civilisation which excited the wonder, but not the emulation, of the happy but idle and poverty-stricken Mexicans. This hut had been built by an American who, having taken to the woods after a quarrel in the capital, had selected this obscure retreat for himself and his two boys, now orphan youths of nineteen and twenty. The Mexicans did as their fathers did before them: they planted a little maize and a few vegetables; they caught wild horses, and hunted enough to procure what was strictly necessary; and after this meed of exertion, thought themselves justified in spending their leisure hours, at least nine months in the year, in smoking, drinking *pulque*, and gambling for the few rags which they managed to procure in exchange for a little surplus maize, some fowls, and other commodities which their wives and daughters took to the market of Chihuahua. Zealous and Patient Jones, the lads above-mentioned, were very far from being satisfied with this state of existence. They worked six days in the week, they went to market themselves, they took there six times as much produce as did any other two men in Torpedo; they bartered tobacco—the vaporous luxury of all idle nations and idle people—against maize and wild turkeys, and at the time we speak of, bade fair to make of the lethargic village a place of trade, and hence a place of prosperity. Though only just emerging from boyhood, they could have bought the whole village, inhabitants and all.

But Zealous and Patient Jones had no such vast desires; and of all the men, women, and children residing in the hamlet, they coveted only the possession of two. These were Zanetta and Julietta, the daughters of the alcalde or mayor of the small locality. Zealous loved Zanetta, and Patient loved Julietta. Their affection was warmly returned, and nothing was wanting to their felicity but the passage of a year, when it was agreed that all parties would have arrived at their years of discretion, which, however, are oftener supposed to be reached than really attained.

It was a warm autumn afternoon, and the brothers sat at their door enjoying the refreshing breeze wafted over the trembling tree-tops, and odorous with floral richness. They were talking of the future, and of the world of which they knew so little, when a horseman suddenly appeared before them. He wore a costume which was not of the country, and had features which reminded them in their character of their departed parent. They rose as the traveller halted before their hut, and asked, in very bad Mexican, the way to Chihuahua. Zealous hurriedly replied in English that it was eleven miles off.

'I expect you're countrymen,' said the horseman, much surprised.

'We are from New York State,' replied Zealous.

'Well, that's pleasant. I'm dead beat, so is my horse. Will you give a countryman a shake-down for a night?'

The young men eagerly proffered their hut; and while one held the horse's head, the other assisted the traveller to dismount. Mr Bennett, a merchant who travelled

annually to Mexico, was the visitor the hospitable Americans had received; and it was difficult to say who derived most pleasure from the meeting. Mr Bennett was delighted with the candour of the young men; they with his conversation and knowledge. He gave them glowing descriptions of the world; of the power and advantages of wealth; of the delights of an existence among one's fellows; and in fact so fired their imaginations, that when he sought his Mexican grass hammock, the brothers were wholly unable to sleep. They talked, they thought of nothing save the world; and when the traveller quitted them next day, they felt for the first time impatient and discontented.

'I have a great mind to turn *gambusino*, and go gold-hunting in the mountains,' said Zealous. 'I should like to become rich, and return to my native land.'

'For me,' cried Patient, less wild and fiery than his elder brother, 'I could wish to find some hidden spring in yonder forests, and there found a village.' The country was bare of water, and a spring in the wood was a treasure which enabled the fortunate finder to fertilise a vast property, if he had enterprise sufficient to carry out his plan.

'It would be scarcely worth abandoning our home for that,' said the ambitious Zealous, and the conversation dropped. But the thoughts remained, and at the end of a week Zealous had become so infatuated, and so restlessly eager to become rich, that taking a horse, a rifle, powder, shot, a mattock, and a few clothes, he started towards the far-distant mountains without even bidding adieu to his brother or Zanetta, so alarmed was he that his visionary enterprise should be prevented.

Though Zealous had quitted humble prosperity, gentle and real happiness, to go run the world for mere money, he was no common youth. He had genius, courage, and determination, and his whole conduct displayed these qualities. From time immemorial, it had been a tradition that the far-off mountains were full of gold, and regularly every year some ardent and young spirits started in search of the precious metal, to meet only with death or disappointment. Few returned, and of these few none ever brought any portion of gold worth the labour of their search. They hinted at vast treasures discovered in places so distant and difficult, as to preclude their being reached with mules or horses, and returned to the search with renewed zest, but always alone, each man expecting to be the fortunate one, and refusing to share his visioned wealth with a partner. Zealous Jones knew all this, and was determined to take warning by the fate of his fellows. He travelled slowly and steadily, used as little as possible of his powder and shot, and when he killed game, bore away the remains to be eaten with wild fruits, berries, and the esculent roots of the tropics. He was careful, too, of his horse, and reached the entrance of the hilly regions without having violently fatigued man or beast. He then rested two days in the mouth of a sublime gorge of the mountains, where cliff and rock, tree and water, height and vastness, all combined to give grandeur to the scene. But Zealous thought little of the magnificent landscape: his eye, wandering over the green plains behind, seemed to wish to pierce space, and discover, five hundred miles behind, the forms of his brother and his affianced wife. Once or twice his heart was touched; but a glance at the mighty ramparts of the gold region roused within him other thoughts, and he still advanced on his perilous journey.

Months passed, and Zealous was still wandering in the hills, now ascending steep gorges, now precipitous cliffs, that forced him to abandon his faithful horse to graze at their feet; now leaving him a whole day to feed the length of his tether while he explored the rugged hills, mattock in hand, in search of gold; now travelling over lofty table-plains; now resting in delicious valleys scarce if ever trod before by the foot of man; but never finding a trace of the treacherous metal that had lured him from home. Zealous was getting gaunt and thin, his clothes were in rags, his horse was lame, and his ammunition was nearly all spent, having only lasted until now because Zealous had starved himself to spare it.

Overcome by these considerations, he determined to

make a halt in a green valley watered by a stream that formed a pool in the centre. He bathed his hardy steed, examined his feet, and left him to graze unbound, quite certain of his not leaving the valley, and took himself to the water. He floated an hour in the warm sun on the surface of the water, and then struck for the shore, on the banks of which something sparkling made his heart leap. He tore up a handful, and the glittering globules of pure gold revealed the riches of the valley. To dress, to seize his mattock, to tear up the ground, was the work of an instant. The whole mass was full of the precious metal; and forgetting all cares, Zealous began his work of gold-washing and digging. A mattock, a basket of green-willow boughs—such were all his tools; but a month's arduous labour put him in possession of a heap of treasure perfectly marvellous. He now thought of returning, when the fatal idea entered his head—how was his treasure to be removed? Zealous stood speechless with astonishment and despair. His horse, though fattened by a month's rest, was unable to bear much more than himself and his heavy rifle. He accordingly resolved to take a little, bury the rest, and return to the settlements in search of assistance. He accordingly restored the precious heap to its former position, mounted his steed with a small parcel of gold, and began his journey back. It was difficult and painful. Hunger came upon him, his ammunition was all spent, and a few days made him despair of reaching home. A fever and ague, contracted in the mountains, came strong upon him, and his mind began to wander. He gained at length the vast forest that bordered his home, but at nightfall was exhausted with sickness and fatigue. He alighted, lit a fire with difficulty, and lay down beside it to die. The fever was raging, and he lost consciousness.

When he recovered, he was in a comfortable bed in a large farmhouse, with every sign of opulence and wealth. Patient and his wife were beside him. His brother had sought his fire from curiosity in time to save him. The greeting was warm on both sides, and Zealous found to his surprise that he had been more than a year absent. The young man looked wistfully at his brother and at Julietta, who pressed to her bosom an infant a month old. 'Zanetta is married too,' he said with a deep sigh. A sob behind the curtains was his answer, and the faithful girl was kneeling next minute by his couch. The gold-seeker, when an hour had been given to unconnected greetings, asked his brother's history. Patient replied that his grief on the departure of his brother had almost deprived him of reason, but that Julietta had made him cling to life. He resolved, however, to go a journey; and burying himself in the forest, sought as diligently for water as his brother did for gold. A month's search rewarded him. A spring, bubbling at a tree foot, was found, and here he took up his dwelling, married Julietta, hired all the youths of the old village, and was now master of the richest *hacienda* or farm in all the country. Zanetta, true to her first affection, had come to live with them.

'And so will I,' cried the gold-seeker. 'I have gold enough to buy a vast herd of cattle; that is my share. We will be partners once more, brother; and if Zanetta will forgive—'

A smile was his answer. The water-seeker now asked his narrative, which he frankly told. Zanetta shuddered at the dangers he had incurred, Prudent wondered at the gold; but all joined to dissuade Zealous from again risking his life in the dangerous occupation of a gambusino. He cordially agreed; and a month after, the tie of husband came to bind him more strongly to home. The gold he had brought made them amply wealthy; every happiness was around them; love, duty, prosperity, a life without a care, made the hacienda in the woods a little paradise. But the very calmness of this existence acted unfavourably on the ambitious Zealous, who could not feel the reasoning and solid enjoyment of his brother the water-seeker. He thought of his vast treasure in the hills, grew silent and moody, spoke little to his wife, and one day disappeared with five horses and as many sacks, taking this time ample ammunition and some food.

Leaving the inhabitants of the hacienda to their grief, we follow the wild gambusino, who travelled for some days with intense rapidity, for fear of being pursued. It was only at the foot of the mountains that he halted. As before, he stayed two days; but this repose over, he no longer went searching through the mountains, but led his five horses straight towards the unknown valley. After many days of arduous and painful travelling it was found, and Zealous had the delight of finding also his treasure untouched. Two days were devoted to rest and to packing his gold in the sacks provided, one of which he placed on each horse, that he himself mounted bearing the lightest.

When the gold-seeker started on his return, the arid season of the hot days had commenced; the grass was scorched up, and scarce a drop of water could be found. Zealous travelled rapidly, but this acted fatally, for on the fifth day one horse dropped with heat, fatigue, hunger, and thirst, and more than a fifth part of his treasure was lost. To load the other horses with it was vain; the poor animals, parched with thirst, staggered under their present load. Zealous, with a deep sigh, abandoned his gold, and struck across the desert towards the distant forest. No water was found that day, and at night both man and beast were raging with thirst. They halted in a sycamore grove, the dewy leaves of which at nightfall slightly restored Zealous, who, however, found another horse unable to move. Rage, despair in his heart, the young miser pursued his journey; but on arriving a whole day's journey distant from the forest, his whole caravan had broken down. The gold-seeker, mad, his brain fevered by the heat and by disappointment, turned back on foot. His senses seemed gone; and when he reached the first stage where he found a carcase, his mind was really affected, for he wildly strove to drag the gold towards home. From this moment his senses were utterly lost. He flew back on the trace of his fatal treasure; he ate roots, horse-flesh, and berries, and at last reached the spot where lay the last horse. His day was spent in frenzied efforts to drag the sack of gold onwards, his night in sleeping with it for a pillow; and in this state he was found by his brother and a mounted party, who found him after a long and weary search.

It was many months ere the gold-seeker was restored to health and consciousness, and then sad was the result. He seemed a premature old man; his wife vainly strove to charm him; and but for the constant watch set upon him, he would again have started on his perilous and mad enterprise. The water-seeker clearly saw the cause of his brother's grief; but he said nothing, continuing calmly his course, and reaping every day the reward of his solid industry. When, however, a certain time had elapsed, and the body of the gold-seeker was sufficiently restored, Patient determined to try an experiment on his mind. He shut himself in a room with him, and spoke thus: 'My dear brother, you are unhappy, and your misery causes ours. My wife and yours equally suffer from your sorrow: we can do nothing to remove it, because we know not the cause.' The gold-seeker sighed deeply, and shook his head. 'Speak, Zealous,' cried his brother, 'and there is nothing you can wish but that we will all gladly do.'

'It is in vain to struggle against my destiny,' said Zealous. 'Did you find any sacks of gold near me?'

'They are all five in yon cupboard,' said Patient. 'They are untouched: they are yours. They contain vast wealth, but was wealth like that necessary to us? See how happy I am. Why? Because all around is the fruit of my labour and my industry. You are unhappy, your wife is wretched, and all because you have an inordinate thirst for mere gold. With millions of dollars in your cupboard, you long again to tempt fortune.'

'Never!' replied Zealous firmly. 'Take the gold: it is not mine, but yours. Use it for our mutual advantage. Give me my task to perform, and from this day you shall have no reason to complain.' And the gold-seeker went out in search of his wife, with whom he conversed for an hour; and that day at dinner all were

happy. But Patient determined to spare no sacrifice to insure his brother's happiness. A month after that, he left his hacienda, sold it to a rich convent, and retired to the United States, where the brothers entered into a partnership as merchants. But Zealous was wholly cured. He felt deeply the noble conduct of his brother and his wife, and sought in every way to repay them. They are now all contented. Patient has three children, Zealous as many; and their commerce succeeding, they have few cares for the future. They are looked up to in the great city they inhabit; and when the Californian gold fever burst out, the most sensible advice came from the lips of Zealous. 'Do not quit the certain for the uncertain,' said he to young men ready to abandon lucrative posts to go gold-digging; 'honest industry gives you an existence, success can do no more, while the chances of failure are so great. I was one of the fortunate. But then if the gold-seeker did not perish, it was because the devoted water-seeker was at hand.' And he would hurry home to press the hand of his brother, and thank him once more for all he owed to him. The advice of Zealous is little followed, because youth and ardent imaginations are little influenced by reason; but it is probable that, in after-days, the few who stick to their counters and their situations will never regret having taken the counsel of the now cautious gold-seeker. There are always bold and enterprising characters enough to risk such perils, there are always sufficient men of desperate fortunes who cannot lose, without fathers of families and comfortable citizens leaving their home and household gods to tempt Dame Fortune. So always thought Patient, and so now thinks Zealous Jones.

MARINE PHENOMENA.

THE ocean, beautifully rounded in as it is, agitated by storms, and holding in solution the saline particles which elsewhere are distributed so differently, includes a congeries of grand movements, by whose means the waters of the Pacific, Atlantic, and Polar Seas are continually being interchanged. Its apparently capricious magnificence becomes still more sublime when thus beheld subjected to rigid law; as when we connect the pulses of the tide upon the beach with the distant moon emerging from the horizon, or see the tempest-clouds out at sea drawn gradually into the suction of the trade-wind. More interesting yet is it to the voyager to fall in, ever and anon, with tokens of that great motion from the East which turns the Cape, runs up towards the line again, crosses the Atlantic, issues from the Mexican Gulf, and flowing upward like a river till it meets the ice-streams of the north, sweeps round upon itself again, or diverges, like a fan, towards the Mediterranean Strait and the coast of the Great Desert. Hence probably the number of dangerous minor currents that bear in landward along the south-western shores of Africa; and some of which none but the eye of a practised old sea-dog accustomed to those parts can detect. A sailor who was one of my shipmates told me he was once homeward-bound in the same latitude we were in at the time, in a Hull barque, commanded by a hard-a-weather captain, who depended, however, on his mate for the navigation, when they fell into a mess, as he said, all owing to a 'double current.' They were driven to eastward a good deal by a strong south-wester, after which they had just begun to lie their course again, with a very light breeze from south-east, when, according to the mate's reckoning, they were but a few degrees from land. The captain got rather uneasy, knowing the nature of the coast and the badness of the chronometer; but the barque kept slipping all day through smooth water with every stitch of canvas set, and the mate considered it was all right, and plenty of sea-room, even though she had been a Dutch tea-ship instead of the sharpest barque out of Hull. There was an old fellow of a sailmaker on board that had been once in a slaver, and the mate saw him spitting over the side, and watching it go past.

'Well, my man,' said the mate, 'what does she make?'

'Barely a knot and a-half, sir,' said the sailmaker; 'though, to my thinking, there's a current with us by all appearance.'

'So much the better, my man,' said the mate, rubbing his hands.

'I don't like the look of it though, sir,' said the sailmaker. 'That same haze yonder to nor'-eastward, you see, sir, 'tis a good sight nearer on our weather-bow, to my thinking, since the morning. There's a bluer colour in the sky thereaway too; in short, sir, it's dreadful like the loom of the slave-coast. I shouldn't wonder,' said he, 'if there was an under-current sliding her in, starn foremost, all the time she looks to be forging ahead!'

The mate only laughed at this idea; but the old sailmaker having kept hard at work for some time sounding alongside with a line and a half-sunk float, found reason, as he thought, to confirm his notion; and by next morning they were actually in sight of the African land, almost embayed, and setting in towards it. Upon this the captain had recourse to the old seaman's advice, and altered the course, so as to steer across the drift of the current until they had got free of it, and gradually edged off with the sea-breeze; probably just in time to escape being grounded upon a bank.

We were once in a calm on the Atlantic, a little to the southward of the line, and in longitude somewhere between 20 degrees and 30 degrees west; the ocean, having subsided from a swell on the previous evening, appeared so perfectly at rest, and so did the vessel also, as to recall the poet's image of

'A painted ship
Upon a painted ocean.'

There was not even that low tremulous heave, or those long serpentine undulations, resembling the faint breaths of a sleeping or shackled monster, which generally seem to pervade the most entire repose of the great deep; the round expanse lay intensely blue in the paler embrace of the sky, that poured upon it, as from a mighty cup of light whose inverted bottom glowed like a single diamond, the equatorial cornucopia of light and heat. Which of the two was the more impressive it were hard to say—a 'sleeping calm' or a 'dead' one, as they are emphatically designated by sailors; but the latter, as is obvious, indicates in itself the far longer continuance of its reign, since it shows how distant is even the impulse of any breeze; and perhaps because, although 'every calm breeds its own squall,' yet for a time the very smoothness of the water tends, within so wide an extent, to spend, diffuse, and prevent the acceleration of those that may arise. What gave one the most striking sense, however, of helplessness and awe, was the manner in which our Indiaman, so long true to her compass and her sails, not only lay like a log upon the sea, but by degrees revolved as upon a pivot, until at length she boldly faced the way she had come, then the pole, north-west, and west, while the motionless and unbroken horizon round her betrayed no sign of the change. It was difficult to conceive what cause this freak could be attributed to without a breath of air or a pulse of ocean; but the more complete the calm became, the more apparent on the surface grew the long-drawn wrinkles and winding lines that testified to some sub-superficial agency. Rising, as it were, with the cessation of all upper influences, from the blue depths of ocean into light, or possibly elicited by the inert mass of the ship, the undulation of their movement seemed traceable towards one direction—that of north-west. With next morning's dawn, indeed, when the sun's presence below its rim gave a leaden tinge to the water, and a long thin cloud lay along it, these faint traces looked still more obvious in the shadow, wearing the aspect of a path to the horizon, or of a gigantic web-work intermingled with slow, oily eddies, while the ultra-marine tint of the sea was variegated with wind-

ing patches of pale, of emerald, and of dark; the horizon itself glowed purple, and was edged with a keen semicircle of light, as the morning radiance spread from beneath it. Here was probably displayed some palpable development of the westward equatorial current, or some modification of it, from the South American continent and the estuary of the river Amazon. But in the evening again the surface appeared to have become perfectly smooth; the fragments thrown overboard by our cook seemed to float away ahead inch by inch, though in reality it must have been the ship that, from her deeper hold of the water, drifted almost broadside on in the course of this secret draught. From chronometrical and quadrant observation, we had by next mid-day actually crossed the line again, and increased our west longitude by some perceptible proportion of a degree. This sudden smoothing of the water to a glassy uniformity too was to all appearance premonitory of wind, which that evening came on from north-westward; gently at first, then almost failing, then with increased force, and which might at a considerable distance have exercised such an influence upon the surface as to depress the motion of the current. In the twilight, while we stood away with all sail set upon our former course, the ship was surrounded by little floating lights, crossing her track astern and ahead, as if produced by columns of medusæ, that rose on the tops of the small surges or sunk in the hollows. As the shock of the waves became more violent, they absolutely blazed up into flame under her bends, seething in liquid fire over the chains, the whole ocean apparently rising into vivid life after the long calm, and communicating with every wash of its waters the sense of joy partaken by a thousand unknown creatures.

While upon this head, I cannot forget the emotions produced by my first conscious view of the celebrated Gulf-Stream. From about 30 degrees north latitude, and 30 degrees west longitude, nearly opposite to the Canary Islands, the continuation of a violent south-easterly gale had driven us for no less than eight or ten days so far to the north-westward, and in such a wild state of atmosphere and sea, that by the dead reckoning alone we had but a poor idea of where we were. Our ship was strong and new, and buffeted gallantly against it; the increasing cold, the pale savage look of the billows, with the showers of hail and sleet, made us think we were fated to drift over the Newfoundland banks, and some fine morning or other might have to hail an iceberg from the fore-topsail yard. At length, however, the storm seemed to have blown itself out, our usual canvas was again gradually substituted for the stiff, dingy-looking staysails, and we began to beat up for the north-east, though still close-hauled, and occupied in furbishing up our weather-marks. Before a distinct observation could be taken, the atmosphere being pervaded by a moist blue haze, there was suddenly a perceptible change of temperature from the sharpest cold to mild and balmy; the wind, shifting to south, became warm, and all at once we were surrounded by floating pieces of light-coloured weed, which thickened as we proceeded, appearing to keep down and encumber the rise of the waves, till at length we felt as if they impeded the ship's course. The huge dark surges were now long low swells; the interesting variety of marine productions, vegetable or animal—of tropical waifs, even of nautical odds and ends, which turned up from the furrow we ploughed, or were seen floating astern—kept those who had leisure perpetually on the look-out. Bunches of beautifully-delicate sea-weed, trailing patches of green *fucus*, fragments of reed and cane, a cask-head covered with barnacles, and numbers of mollusca, medusæ, and star-fish—all intimated our being on the outskirts at least of the 'weedy' or 'grass sea': those oceanic meadows which, towards the south-eastern bend of the great current, become at times so dense as to convey the notion of a vast swamp or rice-field.

Next morning watch at daybreak, with a light breeze

from the south, the sea scarcely ruffled, but heaving, and sunrise crimsoning the long line of haze upon our larboard-bow, the edge of the Gulf-Stream could be seen from the bowsprit and decks, marking the north-eastern and eastern horizon. It was distinctly contrasted with the colour of the sea around us, as a dark indigo blue from a more azure one, having somewhat the appearance of the broken water at a distance which betokens a squall; although the level beams of the sun gave it a pure opal tinge, which was deepened by the horizontal focus; while the mild clearness of the sky beyond sufficiently precluded any notion of danger from wind. However, on ascending to the fore-topsail yard, where it seemed like a broad band of intense colour fading into a sapphire rim, one could easily perceive the waves of which it was composed to be toppling and dancing up at a brisker rate than those near us, as well as to be running in a different direction—namely, to the east or south-east. At particular conjunctures of wind and sea, the Gulf-Stream is understood by sailors to enlarge or contract its volume, and to increase or diminish its rate of motion, which latter is here generally about a mile and a-half per hour: at present, the eddy along its limit, with the counter-impulse of the two sets of surges, formed a short cross-sea, yeasty, broken, and passing farther on into larger foam-topped waves. The nearer to a calm over the sea in general, the more striking must be the phenomenon displayed by the sight of this bluer and warmer expanse of water, in an atmosphere of its own, moving along to the south-east like the current of a huge river. Our entrance upon it an hour and a-half after was sensible even below by the pitching, jerking, disagreeable heave of the ship; she went dancing and tossing her martingale over it, the wind almost instantaneously having shifted to a strong breeze from north-west, that brought in our topgallant sails; while another vessel was perceived hull-down to westward of us, apparently heading across our course under single-reefed topsails, as if she had met with a gale.

From the Gulf-Stream, one branch of its fanlike termination sets in towards the Mediterranean, blending probably with the strong suction through the Gut of Gibraltar, where the encounter of these with the frequent *greggales*, or north-easterly gales from the Levant, makes that strait rather a ticklish situation for the most skilful and hardiest of mariners. The whole of the Mediterranean, by the way, from the variety and fickleness of its moods and peculiarities, is calculated for a useful school to the seamen bred in it; yet it may be remarked that even in their own sphere these inland sailors show nothing equal to the experience, ingenuity, and practical readiness of the regular northern tar accustomed to blue water. They are too much addicted to coasting, and dodging about from point to point; and in a Levanter their plan is to haul down or cut away everything; while they do not appear to be better prophets of a 'white squall' than those whom long use of an open horizon has taught to be always looking to windward. Speaking of the Mediterranean, which is well known to have no tides perceptible on land, it is the opinion of old sailors that there are, however, many strong currents throughout its expanse, on which the moon, both at full and change, has a very powerful effect. A similar remark is made in the journal of Mr Williams, the nautical friend of the poet Shelley, who was with him up to the point of his melancholy fate off the coast of Italy. He mentions a heavy swell having got up along shore, evidently caused by lunar influence, and which made a noise on the beach like the discharge of artillery, the moon shining brightly; while out at sea it was quite calm, and without a breath of wind for days together, although succeeded by violent gales.

The *phosphorescence*, or luminous property of the ocean, in various circumstances, and with different modifications, is another phenomenon generally known. This, although observed more or less not only in the extra-tropical, but in the polar seas, becomes still more

distinct between the limits of the torrid zones—perhaps most of all remarkable in the Indian Ocean. By Humboldt, Scoresby, Darwin, and others, the appearance in question has been unmistakably assigned as the result of no quality in the water itself, or simple phosphorescence of animal or vegetable matter, but as proceeding from the innumerable animalcula, medusæ, and mollusca which people the upper regions of ocean, as glow-worms do a green bank in Kent, or fire-flies an Indian grove. Of these minute creatures there are evidently many species, some of which not merely produce light in the dark, but in the daytime give a peculiar tinge to the sea. In size they no doubt vary from imperceptible points up to several inches in diameter; the presence of electric forces in the star-fish, torpedo, and other marine animals, might seem to point towards some special economy in the ocean with respect to the distribution of this vital fluid. Humboldt found that if a very irritable *Medusa noctiluca* were 'placed on a pewter plate, and the plate were struck with any metal, the small vibrations were enough to make the animal emit light.' The fingers which had rubbed it also remained luminous for two or three minutes. Either a change of temperature, or the shock of the waves, would in various ways act upon all these curious species in the production of light. The phenomena discoverable in a drop of water are, as it were, shown on a scale of corresponding magnitude in the depths of the sea, which sometimes appears about to display at large the common experiment of the chemical lecturer—turning water into fire, or *vice versa*; so linked together are nature's apparent extremes.

To the voyager towards tropical regions this wonder of the solitary ocean furnishes one of those beautifully-varied spectacles which, growing familiar, become almost a compensation for many lost home-comforts. Like the outspread starry heaven, too, of the sea vigil, the ship's track glows winding astern in the dusk, where the gulls and petrels hang aslant, or run along like the crows after the plough in the field, to pick up the food turned out by her mighty keel; it grows brighter as the darkness increases, the wave crests glimmer, the water splashes on the bulwarks in fiery spray, keen sparks rise in constellations under the eyes of the passenger as he gazes overboard. The phenomenon exhibits sometimes, nevertheless, a solemn and almost awful aspect even to one accustomed to it. I remember this one dark night at sea, in the equinoctial latitudes, with a light breeze after a swell, when the slow, sullen, long wash of the surges rising and falling round us had in itself something impressive, heard in the boundless obscurity of the first watch on deck. Here and there detached floating lights were faintly distinguishable to a distance on either hand, dipping in a hollow, rising on the top of a wave, or suddenly brought near by a wider swell, so that one could scarcely get rid of the notion of being surrounded by mystical elfin things, or in the vicinity of some strange foreign shore. Now and then, too, looking into the water alongside, with the slow motion of the vessel, you could perceive coming up towards the surface, or gradually sinking down from it into the liquid dark, some luminous point, or a larger form dimly visible by its own trailing glimmer, like a star-fish or sea-jelly. Gradually the breeze had freshened a little, while out of the gloom of the northern horizon burst now and then a silent flare of 'summer lightning' or 'wild-fire,' that showed the outline of the dark surges heaving multitudinously for miles around. Almost all at once the water, as it washed up about us, and the tops of the waves next to the wind, began to sparkle and blaze; the dark hull of the ship, as she leant over with her upper canvas rising into the obscurity, was brought out in vivid contrast to the face of the rolling element seen by its own light. Every time she plunged into it you expected the whole abyss would kindle next moment in actual flame; and although, with the help of custom and experience, a thrilling interest was soon felt in hanging over it, till the crest of a sea burst, warm and seething, above the fore-chains, yet one was

relieved, after all, when he went below, or the dawn gradually restored the original ocean colour.

The natural colour of the ocean, as essentially composed, and when unmodified by extrinsic circumstances, is a property which, most obvious as it is of all others at first sight, furnishes in itself no small source of pleasurable sensation to the voyager. By landmen, green is considered the tint most calculated to refresh the eye, or least apt to weary; but the sailor is still more strongly convinced in favour of deep blue, which perhaps, indeed, from its transmitting no direct rays of red or yellow, may have the advantage in this respect. The colour of the sea, unlike that of rivers and lakes superficially depending on the sky, is the result, not of simple reflection, but of refraction in the dense medium constituted by its diffused salts, where all but the blue rays are absorbed in the absence of any bottom to intercept those of greater subtlety. The sky over the ocean is, it has been observed, comparatively less blue than that towards land, and of a paler azure; since the watery vapours collected near the coast transmit the blue rays to us more freely. The deep fixed indigo of the main surface continues almost irrespectively of the floating clouds above it; deepening, however, with the compression or the wrinkles of a breeze, and softened at the distant line of horizon into that exquisitely-delicate tint hence called *ultra-marine*, which varies, according to the light, from the hue of the 'forget-me-not' up to that of transparent opal. The true tinge of the sea is best noticed by looking through a tube or orifice, such as the ship's rudder-trunk; while that of the sky is naturally intenser in degree when seen between the openings or past the white edges of the sails. Objects floating within sight below the surface, the blade of an oar or the body of a fish, reflect back the absorbed rays of yellow or red, and appear visibly green; so that, even from the highest mastsheads, a shark or smaller fish can be discovered as it swims past the vessel.

The various accidental tints of portions of it, however, both in and out of soundings, bring into stronger contrast that of the great main ocean, and might, on a large and well-figured terrestrial globe, be represented with interesting effect. The brown or green sea along a coast—the Red Sea, coloured by its bottom or by animal matter—the Yellow Sea, by clay in solution, are familiar to most. The blue of the Mediterranean, embraced by its pure, violet-tinted atmosphere, is of a lighter and more shifting character, more in harmony with the sky and air, than that of the solemn tropical waters, over which the heavenly vault looks more pale and unearthly, while the distances seem smaller to the horizon. Within soundings, where the depth is not great, the colour is affected by the quality of the bottom. 'Fine white sand, in shallow water, yields a greenish-gray or apple-green, deepening with the depth of water or decrease of light: yellow sand, in soundings, gives a dark-green; dark sand, blackish green; rocks, a brownish or blackish; and loose sand or mud, in a tideway, a grayish colour.' Not only from these causes, probably, but from foreign admixture, as well as weaker refractive power, does the well-known sombre green prevail, even in the deepest parts of the 'narrow seas.' The local varieties, however, which here and there occur with apparent caprice, and irrespectively of such influences as those already mentioned, are still more illustrative of the boundless fertility of nature, when, as it were, required to relieve the otherwise monotony of her effects. In the western Atlantic, in the parallel of the island of Dominica, or about 15 degrees north, is a large space, where the water, although of course very deep, is constantly milky. Another remarkable anomaly is found in the abrupt transitions of the Greenland sea from blue to green, the former of which tints was supposed by the earlier discoverers to denote the vicinity of ice, the other an open passage. These alternations were seen by later voyagers, especially in high latitudes, about the meridian of London, to lie near each other in long bands or stripes upon the open surface of the ocean, chiefly

towards north and south, varying with greater or less suddenness, and from a few miles to leagues in breadth. Lines of pale-green, olive-green, and clear blue were fallen in with during a quarter of an hour's sailing; at other times the shade was nearly grass-green, with a shade of black; and the separation of the two colours was frequently as definite as the rippling of a current. In this green water the whale was known to prefer seeking for food; while, on account of the greater obscurity, it was there more easily caught, so that the fishers generally resorted to these localities. Captain Scoresby's observations proved that some yellow substance was held in suspension to give this peculiarity of hue; and on microscopic analysis of dissolved snow, which had been stained orange by such a substance, he ascertained the cause to be analogous with that which in other latitudes occasions the phosphorescence of the waves. The melted water was found full of semitransparent globules and fine hair-like substances; different species of small medusæ, possessing the property of decomposing light, and in some cases showing distinctly the colours of the spectrum. Whether these were luminous or not, it was impossible to say, from the absence of darkness during the long polar day; but in no case do we remember having heard of this latter phenomenon to any extent in the Arctic seas; nor do the medusæ of the tropical waters, on the other hand, seem to communicate any foreign tint to the ocean, except in one case, to be mentioned immediately.

In about the year 1796 or 1797, the Dutch captain Stavorinus, when commanding an East-Indiaman, steering for the Channel of Mamala, between the Laccadive and Maldivé islands, on the south-western coast of India, met with a very singular appearance in the colour of the sea. During the day they had observed the water to be darker and browner than usual, without that azure clearness it always has in the open sea. With the approach of evening it gradually assumed such a degree of whiteness as, when the short twilight was fading, to have become perfectly like milk—increasing in paleness till nine o'clock, when it looked as if covered by a white sheet, or like a flat country at night overspread with snow. The horizon was not distinguishable, except to north-west, where the line of separation between sea and sky was only discernible from the latter being somewhat dark and gloomy. No bottom was found with a line of 150 fathoms. The water was transparent in a vessel, but tasted less briny and bituminous than ordinary. The same appearance was observed by the English captain Newland in the same part of the ocean, with this difference, that he saw it intermixed with black stripes, running in a serpentine direction through the whiteness. He also distinguished animalcula in it, by putting a glass with some of the water in a dark place, and holding his hand close over it. From the 30th of January till the 3d of February, the thermometer standing generally about 72 degrees, Captain Stavorinus and his ship's company continued to see this phenomenon every evening and night; each time, however, decreasing in vividness, till it was no longer perceptible. He, too, succeeded in tracing the cause in what he calls 'very minute mussels, of the same shape and appearance as those we vulgarly call *long-necks*, which adhere to timber that has been long in the water, and to the curiously-beautiful shells floating on the surface of the water from the Red Sea with currents (*nautilus*). The rapidly-varying and shooting motion of these animals occasioned, in my opinion, this circumstance.'

The same phenomenon has been remarked in the seas between Amboyna and Banda (Philippine Islands). It is called by the Dutch the white water, and occurs twice a year in the seas around Banda; the first time, at the new moon in June; the second, at new moon in August, not having altogether subsided during the interval. Very few fish are caught while it lasts, but afterwards so much the more: the fish do not like the water, and from its clearness, they more easily see the boats and

tackle. It has also been observed to rot the bottoms of vessels allowed to lie much in it; while it throws up ashore great quantities of slime, filth, and different species of mollusca. It is dangerous for small craft to be at sea in the night where it comes; since, though the air may be calm, the sea always rolls with heavy surges, enough to overset them. This 'milk-sea' has generally been supposed to originate from the Gulf of Carpentaria: it has been by some attributed to sulphureous marine exhalation, condensed at the surface; by others to the myriads of animalcula. To the southward of Amboyna it appears in the form of stripes; and westward, more in heavy rollings of the sea. The more tempestuous the weather proves, the more it rains; and the harder the south-east tradewind blows, the more this white water is seen. Probably a similar provision is thus furnished for those larger mollusca on which the sperm-whale of the Pacific feeds, to that made in the north for the whale of Greenland.

A phenomenon resembling the last in some particulars has been met with in a different part of the Indian Ocean—that vast repository and arena for the more singular marine wonders, whether aqueous or meteoric. It is known by English seamen under the name of 'the ripples,' and an account of it will be found in the 'Edinburgh Philosophical Journal' some time back. It generally takes place with a sudden calm and oppressive atmosphere at night or evening. Electric tokens of disturbance are discernible in the distance, and the horizon glimmers with sudden coruscations, followed by a hollow murmuring sound, which increases gradually till the crews of ships thus overtaken have supposed themselves in the vicinity of breakers. The light in the distance seems to approach, brought vividly out by the darkness of the sea, which becomes agitated, and appears to indicate the furious burst of a hurricane, in spite of the stillness overhead. All at once, with a tremulous motion of the smooth water alongside, the tumultuous line of fire, foam, and noise reaches the vessel, which reels to the shock; the spray rises over her bulwarks, and the whole rushes past like a torrent toward the opposite horizon. This strange disturbance is repeated again and again, as soon as the first has died away; the roar and hiss each time generally diminishing; and the luminous appearance less intense; the air all the while still, but suffocating, the sails not even flapping to the masts. Its effect is appreciated in the greater freshness and coolness of the morning, and the breeze which succeeds; but hence some of those groundless accounts of new rocks or shoals given by timid navigators, who have happened to be thus surprised by the phenomenon partially taking place, and while they had yet steerage-way for making off from the fancied breakers.

THE OUTCRY ABOUT CHICORY.

THERE has lately been no little clamour respecting the adulteration of coffee with chicory, the exact merits of which we will attempt to analyse. In the first place, what is chicory? Chicory is a vegetable of the endive or dandelion order, only larger in the root, and it is cultivated chiefly in Germany. From Hamburg there is a large export of the root to Great Britain. It arrives here in a dried, shrivelled-up state, cut into morsels resembling the shreds of a carrot. In this condition it is whitish in colour, almost tasteless, and exceedingly light in weight as respects bulk. To render it available as a beverage, it is roasted like coffee beans; and when it has undergone this process, it has a black-brown appearance. After being ground, it resembles ground coffee: if anything, it is finer in the grain, of a lighter brown colour, and when put into water, it melts almost entirely away. It soils the hands much more than coffee; and from this liability to impart its colouring properties, it may be distinguished from coffee powder.

In Germany, its infusion, without any mixture with coffee, is taken as a beverage by persons in humble circumstances. The flavour of chicory in this pure state is that of a sharp, sweetish wort, slightly resembling the taste of liquorice, and in colour it has the appearance of a dark sherry.

In its fresh vegetable state, chicory, or succory—the *Cichorium Intybus* of botanists, is said to be a good tonic, and to have the effect of an aperient. Judging from the vast care which nature has taken to spread the dandelion and its kindred species over the earth, we might infer that plants of this kind were designed to be of some considerable use to man or the lower animals; and it would be more than a matter of curiosity to learn what are the actual and beneficial uses to which the vegetable in question may be put. What if the despised dandelion, the 'unprofitably gay' decorator of our roadsides, and the pest of our grass-plots, turns out to be a most important material of human solace and subsistence!

Whatever be the discoverable properties and applicabilities of the dandelion tribe of vegetables, our object in the meanwhile is to see what part chicory is made to perform in the preparation and sale of coffee. To get, if possible, at the truth, we have had three infusions made, one of pure chicory, a second of pure coffee, and the third of coffee and chicory mixed, in the proportion of one to two ounces of chicory to a pound of coffee—that, we are assured by a respectable coffee-merchant, being the proper ratio of admixture. The experiment was made without and with sugar and cream, so as to be assured against any fallacy in the ingredients. Of the flavour of the pure infusion of chicory we have already spoken: it was that of a peculiar bitterish sweet, not very palatable, yet not positively distasteful. The flavour of the pure coffee was something different from what coffee is usually considered to be. There was a *thinness* of body about it, as wine-tasters would say; it was not exactly the thing; few would take it from choice. The flavour of the mixed coffee and chicory infusion was at once recognised to be that which the beverage called coffee ordinarily has when well made, and which most coffee-drinkers, we should imagine, would prefer. Any one can of course make the same experiment for himself, and he will probably arrive at the same conviction. The truth seems to be, that coffee is not what people call coffee, unless a certain quantity of chicory be prepared along with it; and it is rather remarkable that the world has been so long in getting at this fact. The chicory seems to give body to the coffee. It gives it also depth of colour; but that is nothing. It fortifies the quality of thinness in the coffee, imparts that softish and pleasing aroma which makes the beverage acceptable. Besides this, we are informed that chicory improves the medical virtues of coffee, by neutralising in some degree its constrictive effects.

So far, then, the use of chicory as an attendant of coffee may be said to be not only unobjectionable, but proper. The commercial part of the question, however, presents a different aspect. Chicory is a cheap, coffee is a dear, article; and therefore if dealers sell an over-proportion of chicory in their coffee, without making a corresponding allowance in the price, they commit a fraud. The correct and reasonable proportion ought to be not more than two ounces of chicory to sixteen ounces of coffee; but it is stated on good authority that in many shops the proportion is half and half, or in some cases as much as two-thirds of chicory to a third of coffee.

Any such intermixture is undoubtedly dishonest, and cannot be spoken of without reprobation. A principal reason for our alluding to the subject has been to warn coffee buyers against practices of this nature. The most effectual method of guarding against deception will consist in all parties buying coffee and chicory unground, and having ground them separately, they can then mix them in any proportions they please. From all respectable dealers the two articles can be had separately. A good coffee-mill may be purchased for about 4s. 6d.; and with this handy little machine, a housewife may set all the tricks of coffee-dealers at defiance. But there are persons too poor to buy a coffee-mill. That is too true, and in this, as in many other things, the destruction of the poor is their poverty. At the same time, there must be few artisans who cannot spare the sum we speak of; and the knowledge that the public are roused to the subject of coffee adulteration, will at all events prevent grocers from carrying on their adulteration to the extent above referred to.

The discussions in the newspapers respecting the chicory cheat have brought into view another question. At present, a moderate custom-house duty is levied on foreign chicory; and under the operation of the active demand for the article, farmers have begun to raise it duty free; nor can we see any reason why people should not grow it for themselves in their own gardens. Before the cultivation goes any great length, the Chancellor of the Exchequer may perhaps attempt to procure a repressive act of the legislature, such as exists against the home cultivation of tobacco, though we should scarcely expect with the same success. To stop the growth of dandelions, big or little, would baffle even the omnipotence of parliament, and the very effort to do so would be a step beyond the sublime.

As if chicory were destined to raise an uproar, still another branch of the subject has excited declamation. The coffee-growing interest in our colonies has begun to be alarmed at the increasing consumption of chicory, whether foreign or native. It is stated that, for 36,000,000 lbs. of coffee, 12,000,000 lbs. of chicory were sold last year. To stop this abuse, they propose that a duty should be levied of 4d. per lb. on home-grown dried chicory, by that means placing it on an equality with British plantation coffee, and thus, if not checking the consumption of chicory, at least producing a revenue of £200,000 annually. Coffee-drinkers will feel obliged by the colonists taking so much care on their account; but we believe they may spare themselves any farther trouble. Chicory-growers and chicory-drinkers are quite competent to look after their own affairs. If any fresh law is required in this department of economics, it is one to remove all duties whatsoever on coffee; and everything portends that such a law will be in operation at no distant date.

To wind up these rambling observations, it is our belief, as it is that of respectable coffee merchants, that if the use of chicory were utterly put down, coffee-drinking would be lessened in a very considerable degree—perhaps as much as would be the drinking of beer if the use of hops were proscribed. As a diluent of coffee, chicory is used all over continental Europe; and it was not until the English learned that a small proportion of chicory was put by the French into their coffee, that they attained the same skill in the preparation of the beverage. This knowledge was first acquired by those coffee-dealers who aimed at selling 'coffee as in France.' Statesmen are not ignorant that the use of chicory helps the sale of coffee. In April 1844, when a debate on the budget took place in the House of Commons, Mr Baring observed that 'we were mistaken about chicory, in thinking that the use of it prevented the consumption of coffee: he believed that chicory was mixed to a large extent with bad coffee. When Lord Spencer first proposed the reduction of the duty on chicory, the result was, that a certain amount of bad

coffee, which would not pass in the market, was, by admixture with chicory, made to go down. People were wrong in supposing that chicory made bad coffee; he believed that the foreign coffee, which we so much preferred, contained one-third chicory. Cross the Channel, and in point of fact all the coffee you drink contains one-third part of chicory.' It may, however, be urged that, for the protection alike of the fair trader and the public, coffee exposed for sale in a ground state should be liable to the examination of officers of excise, and to confiscation in the event of chicory being found too largely intermingled with it. Nothing would be more proper than such a power of inspection and seizure, provided it could be exerted at little expense or trouble. But we need hardly point out the practical inexpediency of employing excise officers to visit every little grocery establishment throughout the United Kingdom, commissioned with a power to judge of the quality of an article which even experienced parties would be at a loss to determine. On this account, we fear that the public must in this, as in many other things, be left to its own unassisted shrewdness, as well as the ordinary principles of competition in trade, for protection against the unfair imposition of chicory for coffee.

THE MENZIKOFF FAMILY.

Close to the Kremlin at Moscow was to be seen, about the end of the seventeenth century, the shop of a pastry-cook of the name of Menzikoff, famous for making a kind of honey-cake in great request amongst the Russians. This Menzikoff had a son, who, though a mere boy, from his quickness and intelligence was most useful to his father. It was his business to sell the cakes; and he might be seen in every quarter of the city with a basket, which he was often fortunate enough to empty three or four times in the day. On some occasions, however, he was unsuccessful in disposing of his merchandise; and when thus bringing home again part of what he had carried out, he used to steal into his little room to avoid meeting his father, who in such cases would fly into a passion, and send him to bed supperless, and perhaps, in addition to this punishment, beat him severely. And never was chastisement more unjust; for Alexander did his very best to sell his cakes, repairing to the most public walks, and the doors of the principal churches, traversing the streets and the thoroughfares, till at length he was well known to all the inhabitants of Moscow—nay, even to the Czar Peter himself, who condescended, while buying cakes from him, to chat with him, and laugh at his lively sallies and quick repartees.

Brought thus into contact with princes and nobles, the sight of the luxury and magnificence that surrounded them soon inspired the young Menzikoff with a disgust of his trade sufficiently strong to make him long to throw aside his basket, and bid adieu for ever to his cakes. But his aspirations had scarcely taken the form of hope, so vague were they, and so little probability did there appear of any change of condition. Little did he imagine that fortune was even then about to take him by the hand, to raise him to the highest pinnacle.

One day his father received an order for cakes from a nobleman, who was giving an entertainment to several of the courtiers of the czar. Alexander was of course the bearer of them. Admitted to the banqueting-room, he sees a large company, all of whom had indulged in copious libations, and the greater number of whom were quite intoxicated. To Alexander's astonishment, in the midst of the jingle of glasses, and the clamour of drunken riot, he hears threatening words against the czar. A vast conspiracy exists to expel him from the throne, got up by the Princess Sophia, whose ambition could not be satisfied in the obscurity of the convent in which her brother Peter obliged her to remain. The very next day the conspirators were to carry into effect their terrible plot. Alexander hesitates not one moment; he glides unnoticed from the room, and hastens to the

palace. He is surrounded on his arrival by the guards, to whom he is well known.

'Good-day, Menzikoff; what brings you here without your cakes?'

'Talk not of cakes!' he answered, panting and breathless, and almost wild with terror: 'I must see the czar; I must speak to him, and that on the instant!'

'A mighty great man truly to speak to the czar: he has other things to do besides listening to your foolery.'

'In the name of all you love best, for the sake of great St Nicholas, our patron saint, take me to the czar; every moment lost may be the cause of frightful misfortunes. If you hinder me from seeing the emperor, you will repent it all your life.'

Surprised at his urgency, one of the guards determined to go to the emperor and ascertain his pleasure concerning him. Peter, always accessible to the meanest of his subjects, ordered Menzikoff to be admitted. 'Well, Alexander, and what have you got to say so very important?'

'My lord,' cried the boy, throwing himself at the prince's feet, 'your life is at stake if you delay a single hour. Only a few paces from your palace they are conspiring against you: they have sworn to have your life.'

'I will not give them time,' answered Peter smiling. 'Come, rise, and be my guide. Remember only that you must be silent as the grave upon all you already know and all that may happen. Your future fortunes depend on your discretion.'

With these words the emperor wrapped himself in a cloak, and repaired alone to the house where the conspirators were assembled. A few minutes' pause at the door of the room gave him, in the words he overheard, sufficient proof of the truth of Menzikoff's report, and he suddenly entered the room. The conspirators, supposing that his guards were at his back, fell on their knees before him, imploring pardon at the very moment that his life was in their hands.

From that day might be dated the brilliant fortunes of the young Menzikoff. Peter, grateful for the service he had rendered him, kept him about his person, and gave him all the educational advantages within his reach. And well did he profit by them, acquiring in a short time several languages, and such skill in arms, and knowledge of state affairs, that he soon became necessary to the czar, who never went anywhere without him. When on his return from Holland, Peter wished to carry out those plans of social amelioration at which he had been labouring for so many years, he found in Menzikoff a second self, able and willing to co-operate with him in all his projects. Such signal services soon obtained for him the government of Ingria, the rank of prince, and in 1702 the title of major-general. He was then five-and-twenty years of age.

War having been declared against Poland, Menzikoff signalised himself in several battles, and attained to the highest offices. But was he happy? No: the perpetual fears of a reverse that haunted him, the consciousness that he was an object of jealousy and envy to all who surrounded him, robbed him of anything like tranquillity of mind. Every thought was absorbed in the unceasing effort to maintain his elevated rank, now only second to that of the emperor himself. But he was even now ill; he might die; what, then, would become of the favourite Menzikoff? Would his successor extend to him the same countenance? This thought pressing upon him perpetually, induced him to try and find out from the emperor what his intentions were as to the succession to the throne; but the prince was so much offended by the attempt, which he had too much penetration not to perceive, that, as a punishment, he deprived him of the principality of Pleskoff. Menzikoff was fully aware that his fate was bound up with that of the Empress Catharine, over whose mind he had always had great influence, and in concert with her he gained over all parties to favour her succession to the throne after the demise of her husband. No sooner were

Peter's eyes closed in death, than Menzikoff seized on the treasury and citadel, and proclaimed Catharine empress under the name of Catharine I.

The czarina proved herself no ungrateful mistress; she ordered her stepson Peter, whom she had named as her successor, to marry the daughter of Menzikoff; and through the same influence a marriage was also agreed upon between the son of the latter and the Princess Anna. Both couples were betrothed; and Menzikoff, left nothing to desire, thought himself henceforth secure from all reverses; but it was not long before he experienced the proverbial inconstancy of fortune. All his efforts to place his power on a solid basis proved fruitless; the sudden death of Catharine I., which took place two years after that of her husband, entirely changed the aspect of affairs. Peter II. ascended the throne, and soon the impending storm burst upon his head. The Dolgorouki family were the counsellors and favourites of the new monarch, and they had long been the enemies of Menzikoff. They excited in the czar's mind a jealousy of the power of his intended father-in-law, and succeeded not only in breaking off the projected marriages, but in procuring the banishment of Menzikoff to his estate of Reuneburg, about 250 leagues from Moscow. But their hatred was not yet satisfied: his wealth alone gave him formidable power; he might reappear at court; and they now represented to the czar in the most odious light the pomp and splendour which Menzikoff had been imprudent enough to display in the removal of his family from Moscow; and the ruin of the unhappy man was irrevocably sealed. At some distance from Moscow a detachment of soldiers, commanded by one of his bitter enemies, came up with him, and a decree was shown to Menzikoff condemning him for the rest of his life to Siberia, stripped of all his honours and wealth. He was made to alight from his carriage, and after he and his wife and children had been compelled to put on the coarse garb of peasants, they were placed in the covered carts which were to convey them to their place of exile.

Who can paint the despair of the unhappy Menzikoff! A few short days before, he held the second rank in the state, under an emperor whose throne his daughter was to share; and now, stripped of his possessions, of liberty, of hope, he was borne along in a wretched vehicle to the horrible place where he was henceforth to drag out his miserable existence! As a favour, the emperor sent him to the circle of Ischim, called the 'Italy of Siberia,' because a few days of summer are known in it, the winter lasting only eight months; but that winter is intensely cold, though not as long as in the other parts of the country. The north wind is continually blowing, and comes charged with ice from the deserts of the north pole; so that from the month of September till the end of May the river Iobol is completely frozen over, and the snow thickly covers its rude and desolate banks.

Immediately on his arrival in Siberia, Menzikoff was put in possession of an *isba* (the Russian name for the peasant's hovel), situated in a very remote district of the gloomy region, and there he was subjected to the strictest watch. He was forbidden, with his family, to pass beyond a certain prescribed limit, even to go to church. A few days after their installation in their wretched abode, some cows and sheep, and a quantity of fowls, were brought to Menzikoff, without any intimation to whom he was indebted for this act of kindness. It was indeed an alleviation of his sad fate, not only as an addition to his physical comfort, but as inspiring a cheering hope, by showing that he had friends who still remembered and were interested in him. Perhaps their zeal to serve him would not stop here. This feeble ray of hope sufficed to cheer the unhappy family, and impart to them some degree of fortitude for the endurance of their misery; and Menzikoff steadily devoted himself to the cultivation of the ground which was to be the support of beings so dear to his heart.

But new trials awaited him. The health of his beloved wife gave way under the sad reverse and unwonted privations of her new situation, and a short time after their arrival she died. Menzikoff, in his despairing grief, would have soon followed her; but the thought of his helpless children bade him live to be their guide and stay. Religion now imparted to his mind that elevation and fortitude which it alone can give; he now knew the fleeting nature, the nothingness of the riches and honours of which a moment sufficed to deprive him; and he submitted with resignation to his fate, finding in prayer and in the affection of his family his sweetest consolation. But his cup of sorrow was not yet full: his three children were attacked at the same time by the small-pox. His son and one of his daughters recovered; but the eldest, she who had been betrothed to the czar, fell a victim to the fearful disorder. The unhappy father could not bear this fresh bereavement: he sunk under his grief on the 2d of November 1729, after two years' abode amid the snows of Siberia.

The death of Menzikoff caused some relaxation in the severity of the government, and a little more liberty was now allowed to the two children; such as permission to go on Sundays to divine service at the town of Ischim, a considerable distance from their *isba*; but they were not allowed the gratification of being together—the brother going one day, and the sister the next.

Three years elapsed without any change in the situation of the young Menzikoffs; but now events occurred that totally altered the aspect of affairs at the court of Russia. Peter II. died without issue, and Anna, the eldest daughter of Peter I., ascended the throne. The solicitations of the friends of the unhappy family found a ready response from the compassion she herself felt for them, and an edict soon received her signature, recalling the young Menzikoff and his sister from banishment, and permitting their return to Moscow. The young creatures, far from expecting such a change, passed their days in cultivating their farm, and alternately availing themselves of their weekly privilege of going to church at Ischim.

One day, when the young girl was returning as usual alone, as she was passing a cabin, a man put his head out of the little hole that served as a window, and called her by name, and then made himself known as Dolgorouki, the enemy of her father, the author of all the misfortunes of her family, now in his turn a victim to court intrigues. She was hastening home to inform her brother of this fresh instance of the instability of human greatness, when, as she approached the house, she saw a government jäger, escorted by a band of soldiers, at the door. Her heart sickened with the apprehension of some new misfortune, and her trembling limbs were unable to bear her farther, when her brother ran out to meet her. 'Joy, sister, joy!' he cried; 'Heaven has at last had pity on us. Our gracious sovereign restores us to our home and our country. Here is an order from the Czarina Anna recalling us to court, and putting us in possession of the fifth part of our poor father's property.'

For wonder and joy, the young girl could not believe that she heard aright; and it was not till she actually had the document put into her hands that restored them to liberty and to their country, that she could be persuaded that she was not the sport of illusion. But once assured, she stood motionless, breathless, under a revulsion so mighty, so sudden. Then came the thought of her father, of her mother, of all they had suffered; and the first joy was soon mingled and tempered with pensive regret. It was with eyes dimmed with the tears of memory that she met her brother's glance beaming with hope, as on the day fixed for their departure they got into the carriage that was to convey them to Moscow, after having paid a last visit to the grave of their parents, and made over to Dolgorouki their *isba* and all that it contained. The czarina received them

most graciously, and gave to Menzikoff the place of captain of her guard, and that of tire-woman to his sister. Soon after she richly endowed her, on the occasion of her marriage with one of the most powerful nobles of her court.

FESTIVALS AND HOLIDAYS.

REFERENCE to festival days was a primitive mode of marking the seasons as they circled away over earlier and less-occupied generations. These were doubtless the oldest reckoning points in mankind's measurement of time, as the earliest festivals of nations were instituted to celebrate those natural occurrences in which they were most deeply interested, such as the rising of the Nile in Egypt, the date season in Arabia, and the gathering in of the corn in Europe. Old country people still count in a similar fashion. From Halloween to Hogmanay is a well-known period in the calendar of the Scottish peasant; the English rustic knows the weeks and days between May-day and Michaelmas; while Midsummer, Candlemas, and Patrick's Day are recognised terms in the cabins of Ireland.

The holiday times seem to have passed from us hard-working and hard-thinking Britons, with the exception of some Christmas doings by English firesides, accompanied by the emptying of schools and the thronging of theatres; the royal birthdays, known only in our great towns; and a feeble remnant of Scotland's ancient welcome to the year. We are careful and troubled about many things of more importance; but as these half obsolete words meet us in rural districts and legal documents, to which their very mention is now almost confined, it is curious to look back on the variety of days that have been regarded, and the still more various fashions in which they were celebrated.

The observation of days is among the facts which prove the dominion of memory over human life; as dates are the pillars of history, so anniversaries are the most enduring memorials; since time, which corrodes the brazen, and crumbles down the marble monument, perpetually restores them, in spite of wars and vicissitudes: hence, though the first festivals of the world had always a natural sign and origin, yet the commemoration of important events by their real or assigned anniversaries has been sanctioned more or less by the divines, legislators, and the custom of all nations. Fast as well as feast days were indeed thus instituted; but our attention is for the present bestowed on the latter, being at least a more cheerful subject.

The Feast of Fools was the most remarkable festival of the middle ages, the oldest in its establishment, and the first to disappear—having come into use in the middle of the fifth century, and been utterly abolished at the Protestant Reformation. It was observed in almost every country of Christendom on different days, but always between Christmas and the last Sunday of Epiphany. Its chief ceremonies were the election of an abbot or bishop of Unreason, and a burlesque imitation of all the acts and offices of the then dominant Church of Rome. That these mockeries were not only tolerated, but encouraged by the ecclesiastics of the period, whose authority was so extensive and unquestioned, is in itself a phenomenon; yet such was generally the case in spite of both popes and councils, whose decrees were frequently issued, but in vain, against the Feast of Fools. Similar minglings of the burlesque and the pious of every description were characteristic of the Gothic times, and are still observable in the illuminated manuscripts and elaborately-carved columns they have left us, where grotesquely-comic figures are occasionally introduced amid theological, and at times most instructive allegory.

The Feast of Fools is believed to have been a derivation of the Saturnalia, an ancient Roman festival, in which all social positions were reversed for the time, and a good-humoured sort of anarchy prevailed. It occurred at the same season as did many festivals

among the elder nations; nor is it the least curious part of our subject that almost every feast day known to us or our fathers dates its observance from the most remote antiquity, and has been transmitted from age to age, and from people to people, changed in name perhaps, and in the cause of its festive honours: as one order of things passed away, and another came in its stead, successive generations found the old feast days in their places, and used, rejoiced in, or, it may be, abused them, as they did with the other productions of their seasons.

It is also remarkable that the earliest and most widely-celebrated festivals of the world occur in mid-winter. Amongst the Chinese, Persians, and Indians, not only was our Christmas observed with the full complement of twelve days, according to old travellers, but the very sports and amusements peculiar to the season among our European ancestors, and still practised in a small way, were current in those remote regions of the East.

Our New-Year's Day belongs not entirely to the Christian era. The Romans patronised the 1st of January in a similar fashion: it was sacred to their god Janus, from which the month was named; an idol with two faces representing time, the past and future. The custom of New-Year's gifts seems also to have descended from them; for the despotic Emperor Caligula was accustomed to remain in his hall of audience the whole day for the purpose of receiving such offerings. Henry III. of England profited largely by the Roman's example, when he intimated to his courtiers and subjects generally that his feelings towards them for the ensuing year would be regulated by the gifts presented on the 1st of January. Queen Elizabeth availed herself of the steps of her predecessors: she was wont to furnish her jewel-box and wardrobe by contributions so levied; and judging from the three thousand dresses which that 'bright occidental star' left behind her, the presentations must have been neither few nor small; they were even accepted from the servants of her majesty's household; among others, the dustman is recorded to have presented her with two pieces of cambric. But to return to the perpetuation of festivals: it is worthy of remark that Twelfth Night, whose attendant cake, beans, and lambs'-wool, not to wear, but drink, stood so high in the estimation of old festive times, and from which Shakspeare named his finest comedy, is known to have been observed by the early Egyptians with strange symbolical ceremonies of joy for finding their deity Osiris: some philosophers have attributed this coincidence of festivals in different times and nations to what has been asserted as a historical fact, that occurrences of great moment in the destiny of nations or individuals generally take place at the season to which we have referred. It is singular that even the Greenlanders believe their magicians can visit the Land of Souls much more easily at mid-winter than any other period, because the way is shorter; and they also celebrate a festival called the Feast of the Departed about the end of December. There is a sort of agreement to differ between these ideas, not unfrequently found in those of widely-separated men; but it appears that mankind generally have concurred in cheering up mid-winter with festal lights and doings, and, independent of weightier considerations, the season seems to require them. Strange to say, France and Scotland have been the two modern nations that most extensively practised and longest retained the celebration of New-Year's Day by gifts and visits; and though diverse in history and character as any lands could be, they still assimilate in this respect. In Paris, before the recent Revolution, the sales of confectionary, jewellery, and fancy articles of all sorts on the last week of the year were estimated at one-fourth of its entire purchases. 'No statist, as far as we are aware, has yet calculated the amount bought and sold north of the Tweed for similar purposes; but it would probably seem of more account in the eyes of the present generation than the New-

Year's gifts most valued by their British ancestors; which consisted of the mistletoe bough, cut down with a golden knife, and distributed among them by the Druids of their tribes. After-times gave to that wintry parasite of the oak a less mystic significance than that attached to it in the faith of the Celtic nations, to whom it was a pledge of safety and good fortune.

The Carnival was a worthy successor to the Feast of Fools: its glory grew, while that of the former declined; but was almost restricted to the south of Europe, and flourished especially in Italy, from whose language its name—signifying *Fautall*, to flesh—was derived. The custom of masking on that day is said to have been introduced by the Venetians, amongst whom it was always common; and being in many respects suited to the Italian genius and character, it still prevails to a considerable extent in those showy but grotesque celebrations for which the peasant or mechanic of Italy musters up his whole stock of merriment and paras, as the Carnival has been for many centuries the only holiday enjoyed by those classes. The splendours and the license of the Carnival at Venice were standing themes with the old tourists; but they have long since shared the fortunes of its deserted palaces. At Rome, the festival is still observed with all its ancient honours; and in Paris it is kept as a day of more than usual display and freedom, particularly among the lower orders; while in Britain, under the Catholic name Shrovetide—from the Saxon word *shrive*, to confess—it was distinguished only by a feast of pancakes, prepared of old in both castle and cottage, but now remembered no more except in remote hamlets.

Valentine's Day is said to be the heir of a Roman festival at which the young unmarried were accustomed to draw lots, by way of divination, regarding their future partners, in the temple of Venus. When transferred to the saint whose name it bears, this practice remained associated with the day, according to tradition, because St Valentine was the only one among the fathers of the church who contemned celibacy: its observance is old in Britain, but has undergone various modifications before reaching the present form of post-office employment. Shakspeare, in the play of 'Hamlet,' introduces a rustic song, from which it appears that about this time, or earlier, the choice of Valentines, then meaning persons only, was shown by visits; and in the reign of Charles II. it was exhibited by presents, especially of gloves. Pepys in his 'Diary' mentions with wonted minuteness 'half-a-dozen pairs bought for his Valentine.'

The moon has been the governess of many festivals: the apparent growth and wane of that familiar planet, in its revolution round the earth, presents in all climates a species of visible calendar, which they that see may read: it is the simplest method of astronomical computation, and is still in use among the Mohammedan nations, who reckon their year by moons. The Greater and Lesser Bairam are the only festivals countenanced by the Moslem faith; the latter, which is of comparatively little note, is kept sixty days after the former: it begins with the new moon immediately following the Ramagan—a month of fasting from sunrise to sunset—which no doubt contributes to the welcome of the feast. In Mohammedan cities this is given with a general burst of illumination, prepared for some hours previously, and loud shouts from all the dervises, the moment the imaan, who has been on the look-out, announces from the minaret that he has descried the first bright edge of the new moon. The Great Bairam continues for three days, and is the special season for present-making in the East; even European residents and ambassadors are expected to remember the pachas and viziers to some purpose. The festival is believed to have existed long before the days of Mohammed, and was probably adopted from the Jews, whose ancient celebrations of the new moon are known to all acquainted with their history. Travellers have remarked

that the only trace of stated festivals observed among the aborigines of Australia was a sort of assembly which they were accustomed to hold on their wide plains, in order to practise the kangaroo dance under the new moon; but their traditional reasons for so doing have never been assigned. The full moon has also its attendant festivals: the Olympic Games, which were celebrated every fourth year, and governed the historical calendar of ancient Greece, four years being reckoned an Olympiad, commenced at the first full moon after the summer solstice with sacrifice and feast, and were attended by the expert of all nations, who contended for prizes in every department of gymnastics, as well as in eloquence, music, and poetry.

Every year, on the fifteenth day of the first moon, the emperor of China repairs in great state to a certain field, accompanied by the princes and the principal officers, prostrates himself, and touches the ground nine times with his head, in honour of Tien the god of heaven. He pronounces a prayer prepared by the Court of Ceremonies, invoking the blessing of the great being on his labour and that of his people; then, as the high-priest of the empire, he sacrifices a bullock to heaven as the fountain of all good. Whilst the victim is offered on the altar, a plough, drawn by a pair of oxen highly ornamented, is brought to the emperor, who throws aside his imperial robes, lays hold of the handle of the plough, and opens several furrows over the whole field. The principal mandarins follow his example. The festival closes with the distribution of money and cloth amongst the peasantry.

Easter, the most generally-observed of Christian festivals, occurs, as decreed by the Council of Nice, on the first Sabbath after the full moon on or after the equinox. It is especially rejoiced in by the Greek Church throughout her wide dominions. At the same season, splendid processions move under the green olives of Jerusalem, and through the deep snows of Moscow; but their Easter is different from that of the West, as the nations of the Greek faith retain what is commonly called Old Style—the calendar as it stood at the Council of Nice in 322—consequently reckon our 1st of April the equinox, and keep the festival accordingly. The said 1st of April, All-fool's Day with our fathers, though scarcely a festival in the ordinary sense, was long and widely distinguished by its peculiar license for practical jokes. The custom can be early traced in France, Germany, and even Hungary; but its origin remains in more than rustic obscurity.

May-Day, though essentially rural in its character, is a festival whose very memory is bound up with pleasant and graceful associations. It was probably a natural tribute to the general joy and beauty of the season, and early practised among the Greeks, the Celtic nations, and the Saxons, by whom it was bequeathed to the rustic hamlets of England, lingering among them almost till our own railway times. It has been referred to by every poet from Chaucer to Tennyson, whose 'May Queen' is at least the most popular of his poems. Cervantes mentions it in his day as one of the rural feasts of Spain; and the celebration of May-Day with garlands, queen, and morris dances, was considered one of the grandest affairs of London in the fifteenth century.

Beltane E'en, the Vigil of St John, or Midsummer Eve—for by all these names it has been known—is now scarcely recognised except in the remote districts of Ireland, where fires may be seen kindling from hill to hill as the sun goes down, and round them groups of the younger peasantry, gathered to dance, sing, and chat, till the long twilight of that season fades into the dewy night. The festival is old among the remnants of the Celtic race, and has been observed in the Highlands of Scotland, in Wales, and in Brittany. Some say it was derived from the Guebre faith or fire-worship, introduced into Ireland by the builders of those round towers that have been such a puzzle to antiquaries. Certain it is that traces of it are found throughout

Asia: the well-known Chinese Feast of Lanterns is supposed to have a similar origin; and on the steppes of European Russia it is practised exactly as on the hills of Ireland. The affinity of human beliefs and fashions might be almost proved from festivals; but among those of summer days, there is one peculiar to North-western India and the adjoining Persian provinces, extolled by all the poets of Asia as the Feast of Roses. It occurred when that queen of flowers—for the cultivation and abundance of which those regions have always been remarkable—was in its fullest bloom, and flourished most under the early Mohammedan sovereigns, who were accustomed to leave the cities with their whole court and harem for some chosen spot, where they might enjoy its sports in rustic ease—the burden of Eastern etiquette being cast aside for the time. Moore gives a glowing description of this feast in his 'Lalla Rookh.' But on the principle that mankind naturally rejoice over their profits, it evidently originated from the fact, that the rose has for several ages furnished the chief articles of commerce to those provinces, in the form of a variety of perfumes, including the famous attar and rose-water, both indispensable to an Asiatic toilet.

Similar causes promoted the merriment of the vintage in France, and made the sheep-shearings of England such festive scenes when Thomson described them. Wine in the one country, and wool in the other, were linked with national industry and interest—so all nations have kept feasts in autumn. The Indians of North America, with whom agriculture was confined to a little half-weed maize, had their corn feasts; and the 'harvest homes' of Britain have in some degree survived the changes of creeds, of thrones, and of manners. They were doubtless more important affairs when, as tradition hath it, Queen Elizabeth assigned a goose for the Michaelmas dinner of all her subjects who could afford it, because her majesty was engaged in discussing a portion of one when informed of the defeat of the Spanish Armada.

The last day of October, our Scottish Halloween, and the Saxon Allhallows, though now fallen into nearly total neglect, was one of the most noticeable and peculiar of all our popular festivals; the celebration of the feast only at night, surrounded by a perfect network of legendary beliefs and tales, which Burns has so graphically sketched for the amusement, or perhaps instruction, of less credulous generations, mark it with strange characters of mingled mirth and fear. It may be observed that something of the latter has been attached to the eve of almost every festival in the popular belief of different countries. To the German peasant, St Mark's Eve, which occurs at the opposite season, was notable for the same degree of activity among the spiritual powers characteristic of our Halloween; and in the western provinces of France, Christmas Eve was invested with a still more extraordinary terror, as on that night the domestic animals, especially cattle, were believed to be endowed with the power of speech; but their conversation was fatal to all the human family, for those who heard it invariably died soon after. These remnants of what in old English phrase is called 'Fochlore,' illustrate the times to which they belong no less than the specimens of quaint carving and rude utensils exhibited in our museums. Both represent a state of things which has been, and enlarge our knowledge of the past with all its lessons.

The festivals of Christendom were mostly instituted for religious purposes, from which, however, the greater part were soon alienated; and in the progress of the dark ages they increased to such a degree, that at one period Europe had not a single common or working-day throughout the entire year, all being dedicated to one commemoration or another. In short, to quote from a modern poet, 'They had weeks of Sundays, a saint's day every day;' but as a matter of necessity, the majority remained unobserved, for to the great mass of mankind life can never be a succession of holidays;

but the peasants of Russia and France, though so far apart, concurred in appropriating a kind of individual festival from that literal calendar: the French called it their 'Fête,' and the Russians their 'Names-Day,' being, in fact, the day of the saint whose name a person happened to bear, which was therefore celebrated by his or her friends after the fashion of their respective countries. Parties were made in France, and presents in Russia; but the custom is still retained in the dominions of the czar, and servants particularly never permit their names-day to pass without the knowledge of both master and mistress.

The utility of festivals to nations and society in general is a question of considerable controversy: the opposing arguments are founded chiefly on the interruptions they occasion in public business, the facilities they afford for improvidence and idleness, and the abuses by which they have been too frequently disgraced among the working-classes, to the injury of both their means and morals. There is sad truth in this last objection; but, on the other hand, it is contended that the institution of festivals is natural to humanity, and one of the distinguishing traits of our species; that they serve great moral purposes, in reviving the pious or elevating recollections connected with those events which they generally commemorate, and apt to be forgotten in the dusty bustle of business, or the dull routine of mechanical employment. It is also maintained that they contribute to the cultivation of the social virtues, and refresh, with needful relaxation and amusement, the toil-worn lives of the labouring population, which without them would be 'all work, and no play,' with the proverbial consequence—that all human privileges and arrangements are liable to abuses, and those to which they have been subjected, are no arguments against festivals.

CURIOSITIES OF MENDICANCY.

In the 'Journal of the Statistical Society' there are some curious particulars given of the progress of mendicancy in London. During the past twenty years, English mendicancy, as shown in the applications to the Mendicity Society, has scarcely varied at all in the average. The principal increase was in the severe winters of 1832-3 and 1837-8; and a corresponding decrease occurred in the mild winter of 1842-3. This accounts naturally for the variation, and shows that there is neither a moral nor economical deterioration going on among the people.

Irish mendicancy, on the other hand, has increased in London so enormously, that there are about eleven Irish relieved for one English! It is stated that the food-tickets of the Mendicity Society were probably one of the causes of this influx of mendicants. It is supposed that the low lodging-house keepers contrived to obtain a supply of the tickets, and offered them as bonuses to their customers. The news would immediately fly throughout the country, and induce thousands of tramps to pay the metropolis a visit. The rapidity of communication among persons of this class is illustrated by a very remarkable fact: two days before the closing of the Society's office, on the death of the assistant manager in 1848, there were 697 cases, and on the following day not one applicant appeared! A system of communication, therefore, must exist among the London mendicants about equal in effect and rapidity to that of the telegraph. In the course of a single day the whole vast body were informed that it would be a waste of time to present themselves in Red Lion Square on the following morning.

The alteration in the poor-law in the years 1837-9 is described as another cause of the evil, so far as London is concerned. Before that period it was the custom of the metropolitan parishes to refuse relief to all but those who had a settlement in the parish; but since then, a wandering mendicant has as good a right to relief as a resident. The remedy suggested is the discontinuance

of all establishments which provide food or lodging for mendicants without inquiry or the labour test; and to open in their stead district receiving-houses under the superintendence of the police, where, in return for the labour of the applicants, they might be supplied for a limited time both with bed and board. Such places would accommodate the really deserving labourer moving in quest of work; and they would be carefully shunned by the tramps, whom they would bring under the power of the Vagrant Act.

But eleven Irish beggars in London for one English—with an enormous majority on the same side in the mount of crime, as is shown by the reports from the great provincial towns! This is the startling curiosity in the affair; and taken in conjunction with the large sums mentioned from time to time as being remitted to Ireland, the produce of work, theft, and beggary, it points to a state of things without a parallel in history.

MISFORTUNES OF MR NIBBS.

THE other day, on glancing over a newspaper, the following paragraph, descriptive of proceedings in the Court of Bankruptcy, met our eye. The name of the party only is altered:—

‘Mr Commissioner ——— sat, but the cases disposed of were of no public interest. Augustus Nibbs, who was director of a society called the ———

Coal Company, came up on the question of certificate. Mr Nibbs, an elderly gentleman, had retired from trade on a handsome independence, and was unfortunately induced to become a member of this bubble company. Being the only solvent man in the concern, he was sued for the debts of the company, and ruined. His honour expressed his surprise at the credulity with which Mr Nibbs had suffered himself to be gulled by sharpers, but at the same time expressed his concern at the condition to which he was reduced.—Certificate granted.’

We think the reporter for the press was scarcely justified in saying that the above case had no public interest. To our mind it is full of meaning and instruction. We have never, in so few words, read a more affecting case of individual ruin—hopes destroyed, confidence abused by the blackest roguery. We offer a tribute of compassion to Mr Nibbs, although we know nothing of him beyond what the reporter has given of his sad history. Ignorant of actual particulars, we can nevertheless easily fancy a biography for the unfortunate gentleman. Every line in the paragraph aids the imagination.

Mr Augustus Nibbs is an elderly person retired from business. By a long course of diligence in his profession, he had realised a competent fortune, and had retired to a neat villa at Hampstead, Norwood, or some other pleasant suburban retreat. In this delightful seclusion, within an omnibus distance of town, and an arrangement by which he might read the ‘morning paper daily,’ Mr Nibbs had every reason to look forward to a few years of tranquil enjoyment, along with the aged partner of his fortunes. There is a slight difficulty as to whether Mr Nibbs had any family. We rather believe he had an only daughter, who was grown up, and married, and therefore, as he supposed, off his hands. But the marriage of Eliza, as we shall call the daughter, had not turned out happily, so far as worldly prosperity is concerned. Her husband had not been successful in business, and shortly after the retirement of the father, his son-in-law stood very much in want of a situation. Let us here moralise for a moment.

The putting of sons, sons-in-law, or brothers into business, or giving them a share of your own concern, is often a very perilous thing. You mean well, no doubt. Your heart glows with delight at the notion of giving James, Thomas, or whatever his name is, a chance of getting forward in the world. And all very right, if the said young personage is really deserving and competent to the undertaking—if he possess that degree

of skill, steadiness, and self-denial which will enable him to do battle in the great struggle in which society is engaged. If you be not perfectly sure on these points, don't make the risk. Let James feel by experience that he must be self-reliant. And if reasonable help and advice fail, far rather put James on an alimient for life than send him into business. Give him £100 a year to do nothing. It will be the cheapest way in the end.

Fathers-in-law are not always Solomons. Mr Nibbs was anxious to see his son-in-law employed; and his son-in-law seconded the intention. Just at this juncture there appeared an advertisement in the ‘Times’ announcing the formation of a joint-stock company for supplying London with coal on surprisingly profitable terms to the subscribers, and vast benefit to the public. Nibbs was taken with the idea. His money was little better than rotting in the 3 per cents. Here was an opportunity for making an investment; and besides, if he took a hand in the thing, it might be the means of getting a good situation for Tom, that unfortunate son-in-law of his. Here we again take the liberty of moralising a little.

One with another, at least three-fourths of all the joint-stock companies projected rest on false or delusive statements. Decent people, who have retired for life to their easy-chairs, are not blessed with a thorough perception of this fact. There they sit reposingly at one side of the parlour fire, their wife on the other. There is a pleasant warmth from the grate. A favourite little dog lies stretched out confidently on the rug, a picture of animal ease and enjoyment. No sound is heard but the cheerful piping of a canary, which is hung up to bask in the sun's rays at the kitchen window. Employment—old man reading the paper; ‘missus’ at darning or crotchet. Now who would have the soul to break up this scene; shift the accessories; turn out the old gentleman from his well-earned chimney-corner; break the heart of the wife; send the little dog adrift to be the sport of butchers’ boys; and kill the canary? Trust us, there are such upbreaks. The law is an unrelenting monster; and those may think themselves well off who do not come under its talons.

Not to wander too far from the point: the worthy beings whom we talk of commit a serious indiscretion when they have anything to do with joint-stock companies. To understand these concerns, you require to go about and hear all the gossip respecting them—who has got them up? whether the names appended to prospectuses are real or sham? what, soberly speaking, are the prospects of success? Not being assured on these points, let the schemes, however fair-looking in print, pass unheeded. By no means attend any preliminary meeting. If you do, you will get yourself in some way or other committed. Should you be afflicted with a benevolent tendency, be only still more on your guard. Let all projects involving money-risks be examined on rigorous commercial principles. It may sound harshly to say this; but who thanks Mr Nibbs for having ruined not only himself, but his wife, his dog, and his canary, all to help on a concern which he had some notion would benefit his son-in-law?

Unfortunate Nibbs! It was a bad business your ever going near that preliminary committee meeting of the ——— Coal Association. Why did you ever take the chair, and feel flattered at seeing your name down as a director? That polite gentleman in the satin waistcoat and rings, who acted as secretary, was a regular sharper. The whole thing was a scheme concocted to cause decent people like yourself to lose their money. And had not Mrs Nibbs always her suspicions? Do not you remember her saying to you one day, when you were taking your hat to go out, ‘Really, my dear, I wish you would have nothing to do with them joint-stock concerns? What business have you to run such risks? Are not we quite comfortable as we are? Any more money would do us no sort of good; we could not eat, drink, or sleep better if we had the whole Bank of England. Twelve and a-

half per cent. you say! I believe that is all nonsense. My advice is, let well alone; and don't go bothering about joint-stock companies, of which you have no proper experience.' 'It may lead to something good for Eliza and her husband.' 'Stuff: let Eliza and Tom fight through the world as you and I have done.' 'Think of the great benefit to the poor in giving them coal at a moderate price; that weighs greatly with me.' 'Then help those poor you know something about; but don't run into schemes involving thousands of pounds, and which you cannot see the end of. Well, well, I see you are determined; but mind my words—you'll repent it.'

Married women are not speculative. They are generally suspicious of clap-trap-looking projects; and, on the whole, they are right. They see things coolly. They have a salutary fear of domestic disorganisation. Nibbs, a bankrupt, cleared out, now feels the force of his wife's observations and counsels. All the fruits of forty years' industry are gone. An old man, almost forgotten by professional acquaintances, he finds that he has once more to begin the world. But compassionately we drop the curtain over the efforts which a manly though subdued spirit makes to recover itself. At the worst, there are nooks to shelter men like Nibbs from the blasts of adversity. The corporations of London, with a munificence which has no parallel, offer a humble and not comfortless home in their respective almshouses to those whom the world has not treated kindly. Let us hope that, all else failing, the too credulous Nibbs and his old woman—not forgetting the dog and canary—will in one of these homes have found a refuge wherein their aching hearts may rest in peace!

ASTRONOMY.

The least acquainted with the philosophy of the heavens must derive, more or less, instruction and improvement from the most superficial view that can be taken of them. We cannot even cast our eyes above us or about us without feeling our minds expanded with admiration, and our hearts warmed with devotion. In an age of ignorance and barbarism, the heavens taught idolatry and superstition; but now that knowledge is more generally diffused, and men are better informed, they inspire only gratitude and piety. They borrow all their brightness from the great Fountain of light and life, and diffuse it liberally for our use; to teach us that all our endowments are likewise bestowed for the benefit of others as well as ourselves. We learn, from their inviolable steadiness and order, the incalculable advantages of regularity in our conduct, and exactness in discharging the duties of life. Clouds may intercept their lustre, but cannot interrupt their tranquillity; and the upper regions are never more serene than while the lower are convulsed with storms. They affect no precedence but what is sanctioned by nature; as the lighter are ever attracted and controlled by the weightier masses; intimating to us that they are best entitled to rule who are best able to fulfil the ends of government, which is the welfare of the community; and that, among members of society possessing unequal parts, a perfect equality of condition is impracticable. Their obedience to the primary institutions of their Maker is a standing condemnation of our habitual aberrations from the laws he subscribes and the precepts he enjoins. Their beauty, which arises more particularly from their answering so perfectly their respective destinations, reproaches our moral deformity; their harmony, our mutual dissensions; and their combined utility, our want of public as well as private worth.—*Jewish Chronicle.*

A FINE FIELD FOR THE FAIR.

Out of the female immigrants who recently arrived at Melbourne by the 'William Stewart,' eight were married within twenty-four hours after their landing. An offer made to the ninth (a cautious Scotch lassie) was deferred by the fair one, who, with some slight adumbrations as to higher aspirations, professed her intention to 'wait a wee while.' The 'Portland Guardian,' in noticing the nuptial arrangements, only regretted that the ladies had not been landed in that delightful bay, where double the number would have met eligible matches in half the number of

hours. 'Eight weddings in twenty-four hours!' quoth our contemporary; 'pooh! in Portland there would have been sixteen in twelve!' We perceive that some of our London contemporaries have been making comparisons (all in our favour, by the way) between America and Australia as fields of colonisation. We think, with the above matrimonial matters of fact before them, our fair countrywomen at home will acknowledge that the Australian colonies are the true 'United States.'—*Australian Journal.*

LITTLE MILLY.

LITTLE MILLY hath a look in her dark and serious eyes,
Sure it bodeeth future grief—hidden tears and stifled sighs;
Little Milly hath a voice of a low and plaintive tone,
Sad as western breezes dying o'er the harp with thrilling moan;
And she liketh well to wander o'er the solitary hill,
When the silver moonbeams flicker on the diamond-crested rill,
And the apple-blossoms glisten laden with the subtle rime,
When it falleth noiselessly in the latter evening time.

Little Milly looketh up, and the stars she tries to number,
Then a pleasant thought doth come—'tis of Jacob's happy slumber;
Little Milly fain would sleep here beneath the cedar-tree,
Dream of angels floating down, singing songs of melody.
Simple prayers she now repeateth, and her tears begin to flow;
Why she weepeth often thus, Little Milly doth not know;
Only that her heart is full when she speaks to One above;
Above and all around she sees proofs of His Almighty Love.

Little Milly trembleth much at a harshly-spoken word,
Cowering in silent pain like unto a wounded bird;
Little Milly shrinketh ever from a cold reproving eye,
And her timid faltering tongue frameth not a bold reply.
But she goeth 'mid the flowers, precious comforters are they;
God made both the stars and flowers—stars for night, and flowers
for day;
Earthly friends may prove unkind, but the gifts of bounteous
Heaven
Pledges are of love and truth—to the single-hearted given.

Little Milly is a child. Presages of woe to come
Fling not gloom across her path, for she hath a sheltered home;
Little Milly hears the storm, as it wildly onward sweeps,
For the drooping birds and blossoms she is pitiful, and weeps.
But a day is coming soon when she will stifle tear and sigh,
Hiding holy tender thoughts, lest the scorner should be nigh.
Stars may shine, and flowers may bloom, but they can no longer
prove
Solace to a heart that pines—sickening for human love!

C. A. M. W.

A FRENCHMAN AT HIS ENGLISH STUDIES.

Frenchman. Ha, my good friend, I have met with one difficulty—one very strange word. How you call H-o-u-g-h?
—*Tutor.* Huff.—*Fr.* Très bien, Huff; and Snuff you spell S-n-o-u-g-h, ha!—*Tutor.* Oh no; Snuff is S-n-u double f. The fact is, words ending in ough are a little irregular.—*Fr.* Ah, ver' good. 'Tis beautiful language. H-o-u-g-h is Huff; I will remember; and C-o-u-g-h Huff. I have one bad Cuff, ha!—*Tutor.* No, that is wrong. We say Kauf, not Cuff.—*Fr.* Kauf, eh bien. Huff and Kauf; and, pardonnez moi, how you call D-o-u-g-h—Duff, ha!—*Tutor.* No, not Duff.—*Fr.* Not Duff? Ah! oui; I understand—is Dauf, hey!—*Tutor.* No, D-o-u-g-h spells Doe.—*Fr.* Doe! It is ver' fine; wonderful language; it is Doe; and T-o-u-g-h is Toe, certainement. My beefsteak was very Toe.—*Tutor.* Oh no, no; you should say Tuff.—*Fr.* Tuff? and the thing the farmer uses, how you call him P-l-o-u-g-h, Pluff? Ha! you smile: I see I am wrong; it is Plauf? No? Ah, then it is Ploe like Doe; it is beautiful language, ver' fine—Ploe?—*Tutor.* You are still wrong, my friend: it is Plow.—*Fr.* Plow! Wonderful language! I shall understand ver' soon. Plow, Doe, Kauf; and one more—Ro-u-g-h, what you call General Taylor; Rauf and Ready! No? certainement it is Row and Ready!—*Tutor.* No: R-o-u-g-h spells Ruff.—*Fr.* Ruff, ha! Let me not forget. R-o-u-g-h is Ruff, and B-o-u-g-h is Buff, ha!—*Tutor.* No, Bow.—*Fr.* 'Tis ver' simple, wonderful language; but I have had what you call E-n-o-u-g-h! Ha! what you call him?—*N. Y. Home Journal.*

OLD TIMES IN ENGLAND.

SCOTCH reminiscences, Irish recollections, jottings on Germany, notices of French manners, sketches of Italy, &c. seem to be the order of the day; and every one who writes at all, has something lively to relate about modern manners and foreign scenes of the nineteenth century. Why may not I, an old woman, go back a few score of years, and try whether a description of bygone English manners, in a remote part of the country, might not interest the few who are lovers of old things, as I can pledge myself for the truth of my own recollections?

My great-grandfather married in 1722, and new-furnished his house when he brought home his bride: my grandfather and my father made few additions except to the library, so that in my youth all remained much as it had originally been. There were four public rooms—namely, a dining-room, drawing-room, library, and parlour, which last was our school-room. The furniture was very solid, and not very commodious—high, heavy, straight-backed chairs; odd little sofas; fire-screens and hand-screens representing flowers and fruit, frightfully worked in worsted by my sisters and myself; and two stools embroidered in silk by my mother; antique vases, services of transparent china (baby cups and saucers); family portraits; inlaid tables and tea-chests; very full silk curtains drawn up by cords into two scalloped festoons over each window—these formed the furniture of the drawing-room, in the middle of which was a small square carpet, looking even in those days cold in winter. The tall narrow windows, which we children had to stand on tiptoe to see out of, commanded the least cheerful view from the house; and it was only upon 'company days,' when plumcake and flattery abounded, that we liked to find ourselves in it. The parlour was a large, low room, with three windows looking into the garden, and broad window seats, where work and books were always to be found, and where cheerful employment and lively conversation made us pass our time happily. This room, as well as several of the bedrooms, was hung with painted canvas in imitation of tapestry, by which name the decoration went: the figures represented on it were most grotesque, being only copies of famed originals. The garden was, and is still, to me 'a dream of summer.' In spring, a perfect wilderness of birds, bees, and blossom; in autumn, of fruit in such abundance, that we never missed the portion abstracted by the wasps which swarmed there. Everything was in abundance—'Lavender and thyme, and rosemary and rue;' balm and tansy; 'every herb that sips the dew,' in short; and all common flowers, wallflowers, jessamine, lilacs, and laburnums, thorn and sweetbrier, guelder-roses, moss-roses, cabbage-roses, York and Lancaster roses, maiden-blush roses—

smelling as roses never smell now: and much occupation the distilling of the herbs and preserving of the fruits occasioned the whole household. The apple, pear, plum, and cherry-trees were *really trees*; and under the shade of their o'erarching boughs I have spent many a happy hour. In the midst of a smooth-shaven grass-plot there was what in those days was considered rather uncommon—namely, a fine mulberry-tree, the berries of which regularly became red under our northern sun, but never purple. The herb-garden was busy with bees, the hives being placed there near a certain honey-suckle bower, which we children considered especially our own, and where, from babyhood to youth, we spent much time.

My father was very proud of his ancient Saxon family, and looked down upon many of the magnates of our land as mere modern adventurers, who had come over with William I. (he hated to call him the *Conqueror*) to be made gentlemen of by robbing better men than themselves; and he congratulated himself that, from the remoteness of the situation, and the insignificance of the property, *his* ancestors had lived undisturbed in their possessions, and never owned the sway of any of Norman blood. We all bore Saxon names—Ursula, and Edith, and Emma, and Ulrica; Ralph, Harold, Edward, and Edmund (my father would not have called a son William for the world). My brothers were all six feet high, with bright bold countenances, brown hair, and blue eyes; my sisters were tall, fine-looking women. Those were not the days of accomplishments, but we had all a correct ear for music, and sweet true voices; and we used to sing very agreeably in parts 'The Banks of the Dee,' 'Sweet Willy, oh,' 'Barbara Allen,' 'Shepherds, I have lost my love,' and other then popular songs. My sister Edith, indeed, soared much higher, and both played and sung Handel's music much better than it is now executed; and Ursula performed country dances with such spirit, that it was difficult for any young person to *sit still* and listen to her. We could all read French, although our pronunciation was rather barbarous; and all the old standard English authors, Shakspeare particularly, we had at our fingers' ends. All the linen of the family, our father's and brothers' frilled shirts, all our own and our mother's under-garments, were made by my sisters and me; and as we sat in the sunny windows I have described, one read while the others sewed, taking the book by turns; and our conversation when we met at dinner was always directed by my mother to what we had perused in the morning, in order to prevent us as much as possible from indulging in gossip.

Scandal we certainly never talked; but news was eagerly listened to, and the common events of the family and the farm became subjects of importance. Every animate, and many inanimate things had their

names, much as Miss Bremer describes in her delightful 'Home.' The servants, who were all tenants' children, and who did not seek 'to better themselves,' and never dreamt of change, had two names: Marias and Louisas, Elizas and Emilys, were unknown; it was Nanny Wilson, Molly Allen, Betty Bee, and Jenny Foster. Billy Bee, Betty Bee's brother, was the groom, behind whom my mother—when her health became delicate, and she was recommended horse-exercise—rode on a pillion, holding by a broad leathern belt strapped round his waist; and Tommy Fenwick, so called by every one but ourselves—who thought it dignified to promote him to Thomas—was the footman. Billy Bee was a Jack-of-all-trades, though nominally groom; he drove the carriage when the horses were not employed with the carts, he assisted Thomas as footman on company occasions, gave a helping hand to the gardener at a busy time, and carried coals and water up stairs for the maids when they asked him: it was even reported that he had once been seen in the ignoble employment of shelling peas; but *this* wants confirmation, and I believe was a coinage of the brain of Jemmy Darrel, a boy who carried the post-bag, fed the pigs, and was everlastingly busy or idle about the house. All in those days and those districts were Billys and Bobbys, Tommys and Jackys; their sons became Will, Bob, Tom, and Jack; and their grandsons are now William, Robert, Thomas, and John.

We had a cat with a lame foot (Molly Allen, the cook, not deeming it *respectable* to be without a cat), which my mother, who had pet canaries in the house, and pet robins in the garden, mercifully permitted to live, inasmuch as it could not possibly catch any of them any more than it could the mice. Under the name of Mrs Tabitha Grey, she daily lapped her milk, and regularly every six months brought forth four kittens, which were as regularly drowned, until she produced one with a defect in its fore-paw similar to her own, and this, to our great delight, we were allowed to keep, and called it Kitty Grey. The cows, Daisy and Dapple, Cherry and Lady Coventry, were fondly cherished; the horses, the pony, the dogs, even the very pigs, all had their names; and everything relating to these animals was duly descanted on. The quarrels between the three terriers, Tag, Rag, and Bobtail, and the two cats, Mrs and Miss Grey, more than once caused serious domestic disturbances, my brothers siding with the dogs, and we sisters invariably taking the part of the cats. But, upon the whole, we were an affectionate and united family, and the sun 'never went down upon our wrath.' I love to dwell upon these happy careless days and their simple pleasures. What was most unlike the things of to-day, perhaps, was the kitchen. It was a very large apartment, hung on one side with every conceivable description of vessel in *pewter*, none of which were ever used by any chance, though all were regularly cleaned four times a year, Molly Allen priding herself in keeping them as bright as silver. The meat was roasted by dogs—little ugly turnspits, named Cupid, Venus, and Psyché; and although the manner of teaching them was cruel, no sooner had they learned their lesson, than they seemed to like the fun, and those left out barked and yelped angrily at the one selected. There was a large pot for drying feathers, as big as a slipper-bath; and several others, of so enormous a size, one wonders what they could possibly have been intended for. The fireplace was large enough certainly to have roasted a sheep, and even, I think, an ox whole; but in my day nothing larger than a sucking-pig was ever prepared at it. On one side of this furnace, in a sort of recess, was a large square stone trough, with a round wooden mallet called a mall. It was used to separate the outer husk from the wheat, which, when cleansed from it, was boiled in milk, and called 'furnity.' My brothers and sisters were very fond of this mess, which I never could eat, preferring and begging for what they were indifferent to—the chocolate, thick enough for the spoon to stand

in it, that was always kept ready, and offered to all visitors who came from any distance.

While upon the subject of forgotten dishes, I may allude to a happy evening my brother Harold and myself spent with his nurse, a pitman's wife, at a village a short distance from our house. It was the custom in those days when the lady felt herself unable to perform a mother's first duty, to send the child out to a more healthy nurse: Harold was accordingly delivered to Peggy Cornforth, who returned him, at fourteen months old, a rosy robust infant, fonder by far of his mammy and black-faced daddy than of his more refined papa and mamma. Her cottage was kept brilliantly clean by the tidy, industrious Peggy. It had whitewashed walls, nicely-sanded floors, mahogany chest of drawers, a good clock, and tins which reflected the ruddy glow of the large blazing fires that ever cheered the winter's day. Her husband coming home as black as the coals he worked amongst never seemed to soil anything; and well he enjoyed the good things it was her pride and pleasure to welcome him to. The evening she kept Harold and me to tea, nothing loth, all pretending to believe that it was impossible to return home because of the rain, she produced a 'scalding of peas'—that is, peas boiled in the pods, and served with butter—a 'singin' hinny,' and bumble or bummlekit jam—the first an immense girdle cake, the last a preserve of blackberries and brown sugar, which, to the day of his death, my brother preferred to any other; indeed we all liked north-country dishes—'lamb's wool,' made of apples and ale, and a spice veal pie—that is, a veal pie half-filled with prunes in addition to other seasoning. We also ate currants with roast pig, fried crumbs with our game, sage and onion with goose and duck, and so continue doing to this day, such of us as survive, in spite of modern improvements. My father was a pious man, and regularly attended church with his whole household, wet or dry. Moreover, he insisted on our *walking* there: to be sure, the church was not at a very great distance—for Sunday, he said, was a day of rest, and on it no beast belonging to him should carry a weight or draw a load. We had no parasols to protect us: they were unknown. Umbrellas, I suppose, must have been as uncommon, for there was kept, I remember, in the vestry an enormous one of green leather, studded with gilt nails, at least six feet in diameter, which was held over the clergyman at funerals in bad weather when he read the service at the grave. To see father, mother, their eight children, the tutor, governess, and all the servants enter the church in order, was a sight worthy of old England, and calculated to raise the family higher in the respect of the tenants and labourers than if they had come, like some of our neighbours, in a carriage-and-four. Two families even appeared in what I never see now—a carriage-and-six.

Many years afterwards the church and our pew were the only things I found unchanged in the dearly-loved home of my childhood. My visit to the church was indeed a sad one. I sat alone in the old square pew, the green baize linings of which had grown almost white with age. I looked on the worn hassocks where my father and mother had knelt in pious abstraction, with their blooming sons and daughters round them—all gone now, with their hopes and fears, their ambitions and expectations! I gazed on the painted windows and old monuments where often, as a child, I used to fix my eyes while drowsily struggling to give my attention to the sermon I was made to write out afterwards; and which I looked at in later times whilst striving to keep my thoughts from wandering, from what ought to have been their employment in such a place, to the gallant young soldier, whom I followed afterwards as my husband through all the Peninsular war, and to the East and West Indies, where I lost him and the last of my children. Oh what had I not felt and suffered since I last sat there! The old house in its new dress was as little agreeable to my faithful affection for the past.

The garden, I was told, was much improved: it was certainly altered. The fruit-trees were down, and replaced by paradise-stocks; the little, rough, red gooseberries, so old and overgrown, that the birds used sometimes to build in their branches, were rooted out, and small plants growing Brobdignag fruit occupied the same ground; the early scarlet Virginian strawberries were gone; and roseberries, king's-owns, and queen's-owns, and a hundred other names, grew there instead. The old honeysuckle bower, so full of memories, was swept away; few York and Lancaster cabbage or common roses remained, but there were plenty of pretty-looking scentless flowers of the name. The old herb garden was planted with dahlias, and the beehives removed. The old mulberry-tree still stood on the green, which was now enlivened with beds cut into hearts and diamonds, squares and ovals, and filled with fuchsias, geraniums, and verbenas—all very pretty no doubt, but they said nothing to me.

I wandered through the churchyard beneath the old trees, and pored over the tombstones where slept those with whom I had often trod the same ground. I shall never revisit these scenes more: the church has been painted and repaired, and beautified, the spire taken down, and a tower raised instead. Our seat is lined with crimson cloth, and filled with well-stuffed cushions and new plump hassocks. The few old people who remained when I paid this my last visit are dead, and repose in the old churchyard, where the sun ever seemed to shine brighter than in any other place, at least to me. I am a widow in confined circumstances, living in the west of England with an old woman some few years my junior, whose father and husband belonged to the —th Regiment, and whose granddaughter assists her to keep my small household in order. We talk over old times more like friends than mistress and servant, follow the regiment in idea wherever it goes, watch for the promotions and exchanges in it, and take an interest in all the young men who at present compose its strength, many of whom are the sons of those who jested and enjoyed life with us 'in the merry merry days when we were young.' One day, hearing it was to pass at some short distance, we took a weary walk in the heat to hear 'our band' once more. It was long before we recovered the pang of listening to the well-remembered 'quick-step' to which those we loved had so often and so gaily marched, or of seeing ourselves carelessly looked at by our own regiment as unknown old women, whose home knew them no longer.

It is said old age deadens the sensations; mine at seventy-nine are as acute as ever. I have often remarked that as people get old, even when the intellect continues to be vigorous as ever, the thoughts continually revert to childhood: even the accent in speaking which they had lost at times strikes again upon the attentive and observing ear, and they think of occurrences that have lain dormant in the secret chambers of memory since that time. Our very dreams become again the dreams of youth! Not a week ago I awoke in tears and distress, fancying that tall, sharp-nosed governess of my youth was going to punish me for a mistake in my lesson. I remember my dream perfectly: the room, the fire, the old harpsichord, were as vividly present to my fancy as they could have been in reality seventy years ago. I saw my young sisters in their low-cut frocks and diaper pinafores. I saw distinctly their healthy mottled bare arms, their stout black leathern shoes, their close-cut hair. I saw and knew again the music-book, and many of our old school-books, as plainly as I see the pen I am writing with, the pattern of the paper on the wall, the naked waving boughs of the trees. I heard footsteps which I recognised for my mother's in the passage, and heard her speaking to a servant, though I could not distinguish the words. I was once more a child and at home again; and when I awoke, it was some time before I could realise to myself that I was indeed an old woman with whom life was well-nigh over, and all those loved ones, who had

been before me so distinctly but a few minutes ago, long since dead. I close my reminiscences here; to pursue them further might be uninteresting, since I have so little to add to the above recollections of a long-past age. Education is fast assimilating the manners and the habits of even the remoter districts, and there is hardly a trace now left in my old neighbourhood of the ways of the merry days when I was young.

RAILWAY PROPERTY.

'RAILWAY Property, its Condition and Prospects,' a pamphlet by Mr S. Smiles, is one of the most comprehensive treatises on the economic history and present condition of English railways which has yet appeared; and suggests a number of facts and observations that will probably interest general readers.

Railways are a creation almost entirely of the trading and manufacturing classes. They have been made from the spare money of people in business; the rural population have had little hand in them, and the landed gentry and aristocracy have chiefly concerned themselves in extorting high sums for the land which was required. From the interested opposition of landowners, as also of rival companies, the cost of carrying bills through parliament has generally been enormous. The expenses incurred in obtaining the act for the Great Western Railway was L.88,710; the London and Birmingham, L.72,868; the Eastern Counties, L.45,190; and for the Great Northern, L.434,861.

Our author hints at a great blunder having been originally committed by government, in not prescribing certain main routes, and disallowing all railway undertakings till these were completed. A well-digested scheme of railways, superintended by scientific men appointed by government, might no doubt have averted many serious evils; but in all probability the people would have been the first to cry out against any such interference, and no ministry could have stood against the storm that would have been raised. This difficulty, however, Mr Smiles does not notice, though, in our opinion, it meets the whole question. The truth is, the blame of any redundancy in railway undertakings rests substantially with their projectors, the great bulk of whom cared for nothing at the time but making money by the sale of shares.

The total length of railway sanctioned by parliament till the end of 1847 was 11,673 miles; the capital to be raised was L.336,580,210; the amount actually raised was L.167,321,356; and the length of lines opened for traffic was 3816 miles. 'In the session of 1848, about 300 miles of new railway were sanctioned, making the total mileage at present sanctioned by parliament amount to about 12,000 miles. And in the course of 1848 there was called up on railway shares L.33,260,159, making a total of about L.200,500,000 of railway capital raised [by calls and loans] up to the present time.' As there are 3000 miles of proposed railways too absurd to be executed, the length of railways for some time to come will not be extended beyond 9000 miles, and years will elapse before even that extent is completed: at present, only about 4000 miles are opened.

The gross traffic receipts of all the railways in operation amounted in 1847 to L.8,510,886: this sum represented an average per mile of L.2804, and was made up of L.5,148,003 for passengers, and L.3,362,883 for goods. In 1848, the receipts were L.10,068,000; and when the 9000 miles are completed, the gross returns will amount to little short of L.20,000,000 per annum. The statistics of passenger traffic are curious. In 1847, there were 6,572,714 first-class passengers; 18,699,288 second class; 22,850,804 third class; and 3,229,357 mixed—total, 51,352,163. This shows that about a million of people travelled by rail weekly: 140,000 souls daily on the move! Railways develop traffic in the ratio of the length of time they are in operation. First, the passenger, and then the merchandise traffic is developed. 'Already the railways had afforded, up to 1847, accom-

modation for 34,000,000 of travellers yearly, beyond what was provided by the old coach and other accommodation.'

It is incontestably proved that those railways pay best which pass through a populous country. It is all very well for a railway to rest on a large town at each terminus; that of course helps it; but, with some peculiar exceptions, the true paying quality in a line is its accommodation to a thickly-peopled intermediate district. In short, it is local, not through traffic, that a railway company ought in general to reckon upon. The great sums-total are made up not of sovereigns, but of shillings and half-crowns. 'Manchester and Leeds are two excellent termini for a railway, and it might be supposed that the through-passenger traffic between those two places would be very considerable; yet it is the most inconsiderable part of the passenger traffic, which is more of the character of "omnibus traffic." Many passengers are taken up at one station and set down at the next. The Yorkshire traffic is distinct from the Lancashire traffic: as the trains pass through the tunnel under Blackstone-edge, the passengers are generally reduced to their smallest number; then a new influx takes place at Littleborough and Rochdale, and continues down to Manchester. The same features are discernible, in a greater or less degree, on most other lines of railway.' The average distance travelled by each passenger differs according to the class. First-class passengers travel greater distances than those of the second or third class. In 1847, the average distance travelled on the London and North-Western by each first-class passenger was $50\frac{1}{2}$ miles; of each second class, $31\frac{1}{2}$; and of each third class, 17. The average fare paid on this line by each passenger of all classes was 4s. 2d. Small as was this sum, it was above the general average, which in 1847 on all the lines was only 2s. each passenger. About two-thirds of the passenger traffic of all railways is of the second and third class. It has further been brought out by statistics that 'the rural population travel about on railways much more, in proportion to their numbers, than the manufacturing population. The agriculturists live out of doors; they attend markets and fairs, and their pursuits lead them regularly away from home. They go to look after the sale or purchase of their farm produce or stock, to hire or to be hired, to buy and sell in the large towns; and hence we find that the passenger traffic on such lines as the Eastern Counties is much greater, in proportion to the population living along the line of railway, than in the densely-populated manufacturing districts of Yorkshire and Lancashire.' Some lines of railway are fed by a stream of passengers in pursuit of health or pleasure, especially during the summer season, a species of traffic very remunerative. In 1845, the pleasure traffic of the London and South-Western Railway is stated to have amounted to 500,000 passengers.

Some curious particulars are stated with regard to the traffic in cattle and other stock. In 1847, there were carried by railway 500,000 cattle, 2,000,000 sheep, and 390,000 swine. This kind of traffic, and also the traffic in killed meat, are rapidly increasing. 'Large quantities of country-killed meat are now sent to London for sale; much of it is from Scotland. The electric telegraph is employed in the ordering of meat; such a message as the following traversing the wires:—"Send up 600 or 700 stone of fore and hind quarters of mutton." And such is the despatch used, that Mr Hicks, a London salesman, says, that on an order of this kind being recently given to a butcher at Ipswich, the required quantity of meat was in his premises in Newgate Market for sale on the following morning by five o'clock, having been alive on the day before. Not only this, but the country butchers are buying their meat from London, which is becoming the centre of the meat trade. The country south of London supplies itself with meat from the London market; and even Birmingham market is in a great degree supplied from

London through the medium of the railways. The traffic connected with cattle promises to continue an increasing and remunerative branch of railway industry.'

Rural districts at a distance from the metropolis are so largely profiting by railway accommodation, that tracts of country through which no railways pass are placed at a prodigious disadvantage. The traffic on the Eastern Counties Railway to London will give an idea of what is doing in the transit of rural produce. 'In one week, in September 1848, there were carried on this railway—529 cattle, 73 calves, 5598 sheep, 865 pigs, 17,711 sacks of grain and malt, 6578 sacks of flour, 197 tons of meat, 37 tons of poultry, 332 tons of fish, 643 tons of fruit and vegetables, 229 tons of beer, 73 tons of wine and spirits, 19,608 quarts of milk, 59 cwt. of bread, &c. In 1847, 300,000 tons of lime were carried by railway for agricultural purposes, and a great trade is springing up in distribution of town manure over the country. 'The corporation of Newcastle has already set a good example in this respect, having undertaken the collection of the town's manure, which is sent along the railways branching out from that town, and delivered in the agricultural districts at 2s. 6d. per ton. The farmers of Northumberland use the whole of it, and the demand is far beyond the supply. Guano has recently been a considerable article of traffic on some of the lines in agricultural districts; but the manure of the large towns promises to be a far more lucrative source of traffic: only 40,000 tons were carried in 1847. Sand is also used in some districts for agricultural purposes; the Bodmin and Wadebridge Railway (Cornwall) carried 15,000 tons for this purpose in 1847.' In the same year, 8,900,000 tons of coal were carried by railways, at the rate of less than $1\frac{1}{2}$ d. per ton per mile. The general goods traffic on railways is still in its infancy; though it may be justly inferred that it will never be able to compete with the traffic of steam navigation where sea transit is available.

The cost of construction of railways necessarily regulates the fares of passengers. To pay 5 per cent. on capital expended in construction, the following ratio of returns is requisite. If a line cost £10,000 per mile, it will require a weekly average revenue of £16 per mile; if £20,000, £32; if £30,000, £48; and so on. To vary the calculation, for each passenger, or each ton of goods carried, 1d. per mile must be charged, if the cost of construction was £15,000 per mile; 2d. per mile if the cost was £30,000; and so on. On this account, expensively-constructed lines must either charge comparatively high fares, or resign their profits. Much also depends on working expenses. The more level a line is, it is the easier and cheaper worked. 'To master an ascending gradient of 1 foot in each 300 feet of distance—a very trifling rise—a traction force is required twice as great as is sufficient to move the same load at the same speed along a level railroad.' The greater speed required on any line, the greater must be the power employed. 'A good locomotive of the heavy kind now used will draw a train of fifty loaded wagons, or a gross weight of say 375 tons, at a speed of from 15 to 20 miles per hour; but the same engine will only be able to draw on the same line a train of twenty-five wagons, being half the above weight, at a speed of 30 miles an hour. Thus it appears that the thirty-mile speed costs double the slower speed of fifteen to twenty miles, besides the great tear and wear that is inevitably produced by the more rapid traffic.' The demand for power increases in rapid proportion to the rate of speed. Going at the rate of 10 miles an hour, a locomotive will draw 250 tons; but push the speed to 30 miles an hour, and it will draw only 28 tons. Great speed is therefore a most costly thing in railway economics. High velocity is said to be more damaging to the rails than a low rate of speed; but on this point we entertain doubts. Weight of engines, and, still more, irregular bumping motion, we should think to be the more injurious element. An objection has been raised to express trains, on account

of their damaging the permanent way. According to our experience, ordinary trains go actually faster than expresses; they put off so much time in their numerous stoppages, that inordinate and dangerous speed is usually effected between the stations. Steady smooth motion, irrespective of speed, is what ought to be aimed at. By the substitution of lighter engines and carriages, a considerable saving remains to be effected in the working of lines. At present, 'the average weight of a train on the branch lines of the leading railways is 56 tons, and the average number of passengers conveyed by each train on such branches does not exceed 40. The weight of these passengers is about 3 tons, so that for each ton of paying load there is a dead-weight of about 20 tons.' Twenty tons of apparatus to draw one ton!

On continental railways, trains run at a low rate of speed, usually from 15 to 20 miles per hour, and thus insure safety, and enable companies to charge light fares. All, however, in this country wish to drive on at a prodigious speed, and yet they complain of high charges, which is scarcely reasonable. Assuredly the public cannot have both high speed and low prices. Under the old stage-coach system, the higher charges made for fast travelling were recognised, because reasonable. There was a great difference between the fares of the mail and the ordinary coaches; and the same conditions should hold equally with railway travelling. The right of travelling in parliamentary trains at an average speed of not less than 12 miles an hour, and at a penny a mile, must be considered no small boon.

Mr Smiles takes a hopeful view of railway property, and considers that the public is blind to its own interest in not investing in it with greater confidence. He speaks of the financial statements of leading railways as being put forth 'in good faith,' and to be relied upon. On this, unfortunately, the public entertain doubts, which no representations of the press can remove. There is everywhere a lurking fear that the statements issued by directors are to a certain degree fallacious; and the undeniable circumstance of certain companies paying interest out of capital, tends to confirm popular incredulity. The extreme difficulty which companies have in raising loans by debenture is the most convincing evidence that something is financially defective. No one, in lending money in this way, can tell whether he is protected by act of parliament or not. For anything that is known, the borrowers may have already incurred obligations up to or beyond the sum sanctioned by the act. There is only one way of restoring railway property to the thorough confidence of capitalists: it consists in the affairs of each company being investigated and published annually under the authority of a public officer; and also in establishing a record of loans effected on each line, open to public inspection. When the railways are more developed, arrangements of this reasonable nature will be considered a proper part of the system.

THE CHAMBER OF MYSTERY.

My elder sister Ruth and myself were the only children of our widowed mother. She was poor, and we were brought up in a cheap retired village in the west of England. We had two paternal aunts, Mrs Wilson and Mrs Coningsby, and a vast array of cousins, of all ages and sizes. Mr Wilson and Mr Coningsby were wealthy men of business, living in large towns, and we knew but little of these relatives. We had one uncle also, a bachelor, our deceased father's only brother; and it had been a mystery to me from earliest childhood *why* he was so much disliked and vilified by all the Wilsons and Coningsbys. He resided in a distant part of the country, and I did not remember having ever seen him; but kind and useful presents occasionally arrived from Uncle Moss, for which our dear, patient mother was humbly grateful; and both Ruth and I learned to think

with affection of this unknown uncle, to whom we were indebted for many good and pleasant things. Not that the gifts were costly: they were simple and inexpensive; but to us, unused to notice of the kind, they were very valuable. It was not their value we thought of—it was the remembrance, the interchange of mutual sympathies we rejoiced in; and when we did see our aunts and cousins, and they sneered at Uncle Sabby, as they called him, denominating him 'selfish, crabbed, and odd'—yet never, to *us* at least (in the midst of all their affluence), following his benevolent example—no wonder if Ruth and I defended him with all our might. Moreover, we never called him Uncle Sabby, as Mr Moss had a perfect horror of the name, and our mother told us we had no right to offend the feelings or prejudices of any one unnecessarily.

As we advanced in years, we understood better the meaning of the animadversions unsparingly lavished on our uncle's conduct; for he had, some fifteen years ago, bought a *life-annuity* with his fortune of ten thousand pounds, bequeathed by a godfather—thus 'defrauding,' as the Wilsons and Coningsbys said, the legitimate expectations of nephews and nieces. 'Surely,' said Mrs Wilson, 'the *interest* ought to have satisfied the selfish old curmudgeon!' 'It would serve him right if he had died a year after the transaction was completed,' chimed in Mrs Coningsby. But *our* mother, who had never expected anything, thought Mr Moss 'had a right to do what he liked with his own. It would be far different were he married; but a bachelor, confirmed in celibacy as he was, ought not to be blamed for making the most of his means—particularly as all his nephews and nieces, with the exception, indeed, of *her* poor fatherless girls, were the children of affluent parents. And as Uncle Sebastian had disapproved of her portionless marriage with his brother, she might not complain that Ruth and Berenice were excluded from any possibility of eventually benefiting by his death.' Thus argued our pious, charitable mother; and when we heard on all sides of Uncle Sabby's egotism, ridiculous vanity, and disgusting selfishness, we almost wondered how it was he continued from time to time these especial tokens of regard to the poor widow and her two little girls. Our mother herself informed us that Mr Moss had a peculiar weakness attached to his Christian name. The abbreviation of 'Sabby,' for Sebastian, had given him mortal offence; and although the Wilsons and Coningsbys had never trespassed on his forbearance during the continuance of their *hopes* as to the ultimate destination of his fortune, whenever they found this was disposed of past redemption, to spite him, and revenge their supposed wrongs, they persisted in the abhorred abbreviation, until 'Uncle Sabby' had disowned, and refused all further intercourse with the offenders.

Now, as she ever had done, our mother always humoured her brother-in-law in this particular. It was an innocent, if a foolish whim, she said. He was Mr Sebastian Moss at all times with her. He had a morbid craving to see his name in writing, or printed, or in any manner that would bring it into notice; and she humoured him, and he was kind to her after his fashion, and she was very grateful, and taught us to be so too.

When Ruth was in her nineteenth year, she married the curate of our parish. 'It was a most foolish and imprudent thing of our mother to permit it,' said Aunts Wilson and Coningsby, for Mr Mordaunt was nearly as poor as ourselves; although he had a snug parsonage and productive garden, and was young, and loved Ruth dearly, while she was well fitted to be a clergyman's wife on a small income. They had not been married above twelve months, and it was charming to witness their felicity—my mother and I thought them very rich indeed!—when a letter came from Uncle Sebastian—a most singular epistle we thought it—requesting 'that his niece Berenice might be spared to him for two or three months. He required a cheerful companion—low spirits—nerves affected,' &c. My mother hesitated for a long time; she did not know any-

thing about my uncle's mode of life; it was a long journey too; but a ten-pound note was enclosed to defray the expense of that, plainly intimating that acquiescence was expected.

'Berry is cheerful and good-humoured enough to enliven anybody,' said my partial mother; 'and as I am fortunate in having you so near me, Ruth, perhaps I had better let her go: her uncle seems to wish it very much; and Berry is a spirited girl, and can take care of herself.' And so, after much deliberation, it was finally arranged that I was to pay Uncle Moss a visit of three months: my mother could not spare me longer. To Branhholm, therefore, I went by the mail-coach; and never having been far from home before, every object charmed me by its novelty, and I made the best use of my eyes and ears, drinking in with avidity the changing scene, and endeavouring to catch information from the conversation of my fellow-passengers.

I had always heard so much about Uncle Moss's *riches*, that I naturally expected to see a fine house and many servants; so that I was much surprised to find his domicile a small common-looking cottage enough, on the outskirts of the quiet gray town of Branhholm.

He was a tall and thin elderly gentleman, with a long pale visage, and a flaxen wig beautifully curled; a continual nervous twitching about the mouth, and blinking of the eyes, made me feel quite nervous and uncomfortable till I got used to it; he had a peculiarly low sweet voice, and he looked refined and delicate, took extreme care of his health, and was terribly afraid of getting cold. He had suffered a good deal from low spirits or melancholy of late; and his medical man advised change of air and scene; but as the patient refused to quit his beloved Branhholm, the next best thing, if not the best, said the accommodating practitioner, was to have a cheerful young companion for a while! The cottage consisted of eight apartments: a breakfast-room at one side of the door as you entered; behind that my uncle's library; opposite were the kitchens; up stairs was my uncle's bedroom over the breakfast-room; opposite, the spare chamber, now mine; behind these were two more rooms corresponding with those below, and looking into the garden—one the housekeeper slept in; the other was shut up. That other!—it was the mystic chamber of Blue Beard.

The housekeeper, Mrs Dawson, a middle-aged decent female, had resided with Mr Moss for nearly five years; and during that period she had not seen the interior of that mysterious chamber. I never knew any individual so utterly devoid of curiosity as she was; she did not think about it till I spoke to her. There she was, night after night, in this small house, sleeping opposite to this closed room, and never wishing to know its contents, or caring anything at all about them. She had once asked her master if he would like to have it cleaned; but he simply replied, 'No, thank you, Mrs Dawson; it is an empty uncarpeted room, and I never require it.' From the garden I looked up at the single window, and that was often open to admit the air, for Uncle Sebastian Moss went into it once every day. I found that out very soon. Did I not long to climb up to that window, and just take one peep? This did not appear to be utterly impossible of accomplishment; for there was a fine spreading apple-tree below, whose branches reached to the casement, and as I was an expert climber—an accomplishment my worthy uncle little suspected—it would be an easy feat to swing myself from the said branches into the Blue Beard's chamber. But honour forbade me doing this, until at least I had tried fairer means; for my curiosity was really painfully aroused, and I became quite feverish and fidgetty. Mrs Dawson had a boy to assist her, but he did not sleep in the house; and although my uncle's establishment was so humble, and his table perfectly plain, though excellent and abundant, I was not an inmate many weeks ere I became aware that he needed all his income, however plentiful that might be, to meet the expenses he incurred by his liberal, nay lavish outlay

of sums for beautifying and repairing the parish church and erecting almshouses—to say nothing of a magnificent pump in the middle of the market-place, bearing an inscription signifying its erection by 'Sebastian Moss, Esq. churchwarden,' &c. &c. In short, my uncle was a second 'Man of Ross' as regarded Branhholm; but here the comparison between the individuals ceased, for Uncle Moss's liberality did not arise from either philanthropic or ostentatious motives, but simply from a singular craving to hand his name down to posterity. I found this out afterwards, though at the time I was ignorant of it. He was much respected and considered in Branhholm, and his existence was as unvaried in monotonous routine as it is possible to conceive a human existence to be. He was a nervous, timid being, but inoffensive; fond of reading memoirs, pleasant travels, and such-like; while his game at backgammon and weekly club were the amount of recreation he indulged in. 'Then what can he have in that chamber?' soliloquised I. Often I listened at the door, and peeped through the keyhole; and at last I made up my mind to the bold step of plainly asking him for an explanation.

'Dear Uncle Sebastian,' I commenced one morning at breakfast-time, 'I hope you will not think me impertinent, but I am very desirous of knowing if I can do nothing for you. I fear I am a poor companion, and that you are disappointed in me.'

'Not at all, Berry—not at all,' he answered shortly. 'I have not been very well of late, and I wanted to see a young blooming face near me. I should like to have had Ruth too; but you do very well, and I am not disappointed.'

'Then, Uncle Sebastian, let me be of use to you. Let me go in and dust the spare room, and open the window each day as you do.'

He looked sharply at me, and became so nervous, twitching his mouth, and winking his eyes, that I feared having gone too far; but the scrutiny of my countenance seemed to content him, and he said, 'I daresay you mean well: you are a good notable girl, Berry; but that chamber is sacred to myself. Take my advice, and never pry into secrets; there is a "skeleton in every house," did we but know it.'

'A skeleton,' thought I: 'how horrible! What can he mean?' I did not know that it was a mere conventional expression.

I fancied he became more particular than ever in locking and double-locking the door; and I daily became more fidgetty and feverish with the uncontrollable desire to explore the forbidden precincts.

I had been my uncle's guest for six weeks, half my time was expired, and I already looked forward with joy to returning home; for though I was most kindly treated, yet the wearisome sameness of the life I led—companionless, and far more confined than I was used to be—preyed on my spirits. I longed for the woods and streams, for a madcap race, and for a hearty laugh again; for I had not heard my own laugh since I had been at Branhholm.

It was on a beautiful summer evening, my uncle was at his club, and would not be home till late; Mrs Dawson was in the front kitchen busy making preserves, and I sat alone under the apple-tree trying to read: but read I did not; for, alas! the temptation was too strong to be resisted any longer. The window was invitingly open: how simple and easy to climb the knotted trunk of the apple-tree, and to gain the broad window-sill! One peep was all I wanted; just one peep, to see if there really was a skeleton there. This was all wrong, and showed great weakness, and I turned away once or twice. Honour forbade the gratification of my curiosity, but the excitement was delightful; the idea of a climb—the peep—the descent—the secret gained, and none the wiser but I! I resisted no longer; but in a few minutes sat exultingly amid the high branches, and crept with ease and safety to the casement.

Once *there*, I was not satisfied with peeping; but ducking in, I lighted in the midst of the mysterious chamber, looked round, and what do you think I saw? You would never, never guess were you to puzzle your brains for twelve months.

The room was bare, utterly devoid of furniture of any description, and the only thing in that Blue Beard's den was a slab of pure white marble, leaning against the wall, and fashioned as monuments erected to the memory of the dead usually are. There were cherubs at the corners, with wings outstretched and smiling faces, and there was an inscription, legible from a distance, signifying that 'Near this place repose the mortal remains of Sebastian Moss, Esquire,' a blank being left for the date of the month and year of decease; beneath were several lines of versification, the composition of my uncle, and his sole literary production. The tablet was evidently designed for the inside of a church; and I may here mention that Mr Moss had bequeathed L.50 to the clergyman in his will, to see that his wishes were carried into effect, and the tablet well placed.

How long I gazed in blank amazement at the unexpected sight before me! It was difficult for me to realise the morbid craving which had led to such strange results—this wish of an obscure, unknown, lonely old man to have *his name* remembered apart from his deeds.

After the first astonishment subsided, I indulged in a hearty laugh. I had a pencil in my pocket, and a sudden impulse of mischief prompted me to fill up the blank spaces in minute fairy-like text, that day fortnight being the date I chose to insert. This done, I cautiously descended, leaving the window as I found it, and not so much as disturbing a leaf out of its place, by which I might be discovered as the daring perpetrator of the outrage. My dress, indeed, was torn, and my hand was hurt; but I perfectly succeeded in concealing both these disasters; and I was in bed long ere I heard my uncle return. He went to the empty apartment, but quickly returned, having only remained to close and secure the open window. After breakfast next morning I heard him softly enter again. A considerable time longer than usual he remained; and when he came out, locking the door carefully as usual, he went straight to his own room, and did not make his appearance below until dinner was announced. I felt very sorry to see him looking paler than ever, and with a disturbed air, as if some weighty misfortune impended. My heart began to quake, for conscience whispered he *must* suspect my impudent trick, and every moment I expected to be taxed with it, and to receive a serious chiding. But no: dinner passed away, he ate little, and no allusion was made. Could he have discovered the pencil-marks? When a week went by, and day after day he gradually pined away, and lost all appetite, still making no comment whatever, I became dreadfully alarmed; this silence was an awful punishment; and I asked myself, *could* it be possible that my uncle attached importance to the minute writing? On the eighth day from my ascent of the apple-tree Uncle Moss became so much worse, that Mrs Dawson wished to call in medical advice; but he would not hear of it. That morning he had received a letter from my mother, requesting him to stand godfather to Ruth's little son, who was to be named Sebastian Moss. At any other time the compliment would have delighted him extremely; now he merely adverted to it by saying, 'Well, I am glad the name will be perpetuated: as the old Sebastian departs, the young one comes. The stroke cannot be averted; concealment is useless; I have received my call, and I hope I am prepared to obey it.'

When I heard him speak thus, I was almost distracted; and without another moment's hesitation I should have thrown myself on my knees beside him, and confessed my foolish trick. But he stopped my precipitancy by kindly saying, 'Berry, I wish to say a

few words to you, my dear. I do not think that I shall be much longer in this world—in fact my time is *very* limited—and I desire you to pay particular attention to what I am going to say. Should any sudden change take place whilst you are here, which is more than probable, you will send to Hospital Street for my solicitor: he has my will, and will attend duly to its fulfilment. Out of my income I have saved upwards of a thousand pounds; L.500 I mean for Ruth, and L.500 for you, my dear. Nay, do not weep; you must be prepared; for I have received a mysterious and extremely solemn warning. A few days more, and all will be over, Berry; but worthy Mrs Dawson will take care you are properly conveyed back to your estimable mother, to whom present my parting affectionate remembrance.'

Poor dear Uncle Moss! Need I say what I did—need I repeat my confession, delivered amid tears, remorse, and terrors unspeakable, for he disbelieved me at first. It was *impossible* I could have gained admittance to that room, for the lock was one that could not be tampered with; and as to a young lady climbing a high tree, *that* was out of the question. Nor until I convinced him of the possibility, by repeating the experiment in his presence next morning, did he signify his belief of my assertion by an outburst of wrath which did more towards facilitating his recovery than my confession itself. *He*, Mr Sebastian Moss, churchwarden, &c. &c. of Branhholm, had been duped and laughed at by a little saucy girl! She had witnessed his exhibition of superstitious weakness; she had also discovered his treasured secret; and would he not be held up as an object of ridicule and contempt for the residue of his life? I guessed what thoughts were passing in my uncle's mind, as I innocently said, 'Indeed, indeed, dear Uncle Sebastian, I am so ashamed of myself, that I will never repeat the circumstance even to my own mother; say you forgive me—pray forgive me, and forget it.'

'I do forgive you, Berenice Moss,' he solemnly answered; 'but I cannot *forget*, neither shall I suffer you to do so.'

I did not comprehend the hidden meaning of these words at the moment, but ere another week had elapsed their signification was explained. My uncle's solicitor at Branhholm waited upon him, and they were closeted together in the library, where by and by my presence also was required. My uncle introduced me to the young lawyer, gravely requesting me to be seated, and then proceeded to say that he had sent for me in due form thus, that I might be properly acquainted with the alteration he had made in his affairs.

'Your unjustifiable curiosity, Niece Berenice, meets at my hands with the punishment it deserves, to say nothing of your having played off so cruel a practical joke on gray hairs. The L.500 destined for you, before I discovered your real character, I have now transferred to your sister Ruth; she will therefore inherit L.1000 on my decease. Your secrecy, young lady, I do not desire on *my own* account, being convinced that your share in the transaction will secure that during my lifetime at least.'

Oh! never shall I forget what I endured on hearing these cutting words. It was not regret for the paltry hundreds—besides, I would far rather Ruth had them than I—she needed them more—but it was that I appeared ungrateful and heartless to the uncle who had been kind to us for years. Silly, weak, and vain he might be; but he was, as he had just said, a gray-headed old man, sickly and ailing too, and not a fit subject for my joke. Bitterly I wept and intreated forgiveness: my uncle thought I was weeping for the loss of the money, and that made me cry the more; but I considered it as part of my just punishment to be thus misjudged.

The other individual present at this scene read my heart aright; and though I deserved punishment, and met with it, my genuine distress and contrition won for me a friend in the wise young man of law. From a

friend, he became a lover; and when I left Branhholm at the expiration of the stipulated three months, it was as the betrothed of Mr Richard Blossom. Yes, thus I met my dear husband, in humiliating circumstances enough, my uncle expressly warning him to beware of attempting to preserve any secrets from me—and I am quite sure he never has.

We were not married until Richard settled in the metropolis; and soon after the blank spaces on the marble tablet were filled up, and the real date of my uncle's decease inserted, the tablet itself occupying a conspicuous place in Branhholm church.

GOSSIP FROM LONDON.

WE are approaching what is called the 'full blaze' of the London season. The dawn will ere long be lost in meridian brightness. The votaries of pleasure are on the alert: ruminant philosophers are revealing their thoughts, in preference, for a time at least, to chewing the cud; the *littérateur* is thrashing his straw with renewed vigour; the man of science is on the *qui vive*, hoping to meet with listeners for his theories, and new applications for his facts; goldsmiths and silk-mercers are rubbing their palms with expectation; interests of all sorts, from those of the prime-minister or *prima donna* down to the pickpocket, are hastening to their periodical culmination; and perhaps a better time could not be chosen to make country readers acquainted with a few jottings of town talk.

London has been compared to a big pond surrounded by a restless crowd, each individual eager to throw his stone in with a louder splash than his neighbour; and those who can make a splash in no other way will do it by talk. The Arctic Expedition under Sir John Franklin has been a fertile subject. One party contends that the authorities are to blame for not taking further measures to obtain intelligence of the long-absent explorers, and that public meetings should be held with a view to raise subscriptions for the equipment of additional vessels; while another party maintains that government has done all it can in the despatch of the three expeditions sent out last year, with a provision-ship this spring; and the best-informed persons consider that the present year will not pass without bringing us intelligence of the missing adventurers. Let it not be forgotten that the country has been put to an outlay of nearly £500,000, first and last, in making attempts to discover the north-west passage, which, if discovered, would not be of the slightest practical value.

Another topic is the South-Sea whale-fishery: the fact that the United States have 600 vessels engaged in that trade, while England has less than twenty in the southern whaling-grounds, has for some time been felt as a reproach to this country, and British enterprise is now about to attempt further efforts in the antipodean seas. The want of a proper station has perhaps been a cause of delay; but Mr Enderby, late M.P. for Greenwich, whose name is already associated with antarctic discovery, has just obtained a grant of the Auckland Islands, on condition that government be called on for no portion of the incident expense. This group of islands lies to the south of New Zealand, and is said to be well suited for a *dépôt*, both as regards climate and situation; and a successful trade may be anticipated, as the vessels engaged in the capture of whales will be spared the long voyage to England as at present. No special inducements are to be held out to colonists, as it is believed that a community will naturally establish itself in the islands in course of time. Mr Enderby himself will go out to superintend the arrangements.

Among engineers considerable discussion has taken place with respect to the government project of harbours of refuge, which originated in the report of a parliamentary committee, stating that the average annual loss for

several years by shipwrecks on the coasts of England amounted to nearly £3,000,000 sterling, besides nearly 1000 seamen; and one of the causes was said to be the want of secure harbours, to which vessels might run for shelter. Various schemes have been proposed to meet the difficulty: one was to moor huge wooden gratings, both vertical and horizontal, at a convenient distance from the shore, as lately carried into effect at Brighton, within which the sea would be comparatively quiet; another was a line of floating caissons, on which the waves should expend their fury; a third proposed a belt of huge reeds or tubes to be made of cocoa-nut fibre, indestructible in salt-water, and coated with caoutchouc. These were to be moored so as to stand erect in the water, and at the same time present no impediment to the passage of a ship between them. A fourth suggested driving piles and laying down brushwood on the shallows off Deal, which it was expected would be silted up by the action of the tides, and that eventually the Goodwin Sands would be thus converted into an island of 8000 acres; and the necessity of attempting something of the sort was shown by the fact, that the Brake, one of the smaller sands, is now half a mile nearer the shore than it was fifty years ago. None of these plans was considered as suited to the circumstances of the case.

The places recommended as sites for the harbours are Dover, Portland, Seaford, and Harwich: the one at Dover, to contain 520 acres, is determined on, after a good deal of debate as to the relative merits of slopes or perpendiculars; and a vertical breakwater of stone and rubble 800 feet in length is to be erected in the bay.

Another question at present exciting much attention is that of electric telegraphs under sea. It is proposed to enclose the coated wires within a leaden tube, which, being sunk, will in a short time bend and fit itself to the conformation of the sea bottom. No difficulty is anticipated in laying down such a line across the Channel; and instead of Holyhead and Dublin, it is suggested that the telegraphic communication with Ireland should be made to the nearest point opposite Port Patrick. Those who propose to cross the Atlantic with wires, say that it can only be done by the route of the Orkneys, Farøe Islands, and Iceland, to New Brunswick—equivalent to pronouncing the scheme to be impracticable, or indefinitely deferred. But more sanguine or more skilful experimentalists affirm it to be possible to establish a telegraphic communication through the sea without wires: earth and water, it appears, are quite sufficient for the purpose. The fact that such a communication has already been effected across the Thames, is quite enough to cause the parties now in motion to persevere. The *modus operandi* generally stated would be this:—A galvanic battery is placed at Dover, from one end of which a wire passes to a sheet of zinc or copper buried in the sea beyond low water-mark; from the other end the wire is led into a coil, from which it is continued to a greater distance along the shore than to the opposite coast, and there terminates in a metallic plate also under water. A similar arrangement would be made at Calais, and the conclusion, as far as yet worked out is, that the resistance being less between shore and shore than between the extremities of the wires on the respective coasts, the electric current would find its way across in sufficient force to deflect a needle. The idea is most ingenious, and if carried out as anticipated, will obviate the difficulty presented by liability of submerged wires to fracture. One really important advantage to accrue from a wide extension of telegraphs would be the announcement of storms. Take, for example, such rivers as the Loire and Rhone, liable to sudden inundations; if the news, 'a flood is coming,' could be flashed along its course, the dwellers in the lower country would receive twelve hours' notice of the rise, and take measures to secure their property.

In palæontological science, an important addition has been made to our knowledge by Dr Mantell's completion of the skeleton of the *iguanodon*. Recent

excavations in Tilgate Forest, and the Isle of Wight, have brought to light portions of fossilised bones hitherto wanting. These have been laid before the Royal Society, and serve but to heighten our conceptions of the magnitude and powers of the antediluvian monster; upon which it is said Dr Mantell will go down to posterity. Among other interesting topics connected with the same society, may be mentioned an instructive paper by Captain Beechey on the tidal phenomena of the English and Irish Channels.

According to Mr Smee, the human body is nothing more or less than a voltaic machine, and mental and physical action depend on the efficiency of the animated battery. The idea is not new, but it will give people something to talk about for the next few months. And while on the subject of physiology, a curious fact is worth notice, of which Quetelet was perhaps unaware when writing on physical growth. Lord Lovelace adduces it from a recent French work on the deterioration of the population in France. 'In spite,' it is observed, 'of so large a portion of the French population being agriculturists—that is, belonging to that calling in life which most develops muscular strength and activity—in spite of that proportion being on the increase as compared with the rest of the inhabitants, it is proved that the number of recruits rejected as unfit for the military service, from deficient stature, health, and strength, is slowly, surely, and constantly on the increase: 40 per cent. are turned back from this cause, and yet the required height is now less than five feet two inches. The standard has been lowered three times since 1789, and yet there is as large a proportion of conscripts below it as ever.' Here is one of the changes going on before our eyes, attracting but little attention in detail—like a geological upheaval—but startling in the aggregate. In connection with it, a fact brought forward by a writer in the Edinburgh Review deserves consideration:—'There are certain districts,' he states, 'in Leitrim, Sligo, and Mayo, chiefly inhabited by the descendants of the native Irish driven by the British from Armagh and the south of Down about two centuries ago. These people, whose ancestors were well-grown, able-bodied, and comely, are now reduced to an average stature of five feet two inches—are pot-bellied, bow-legged, and abortively-featured; and are especially remarkable for open projecting mouths, with prominent teeth, and exposed gums, their advancing cheek-bones and depressed noses bearing barbarism on their very front. In other words, within so short a period, they seem to have acquired a prognathous type of skull, like the savages of Australia—thus giving such an example of deterioration from known causes, as almost compensates, by its value to future ages, for the suffering and debasement which past generations have endured in perfecting its appalling lesson.' But truly may it be urged that such facts as these are interesting not only to future ages; the subject of pauperism and mendicancy is in every one's mouth, and here we seem to arrive at one of the physical causes of the evil. With nearly 2,000,000 of paupers, people may well iterate—What is to be done?

California of course is a prolific topic of discourse; but it is a little singular that the returns from the 'diggings' should be considered as unprecedented. Large lumps of gold have been found in other countries. Sir R. Murchison states that at the time of his visit to the east of Russia, lumps weighing from 13 to 24 lbs. had been discovered in the Ural district; and subsequently, in 1843, a mass weighing 78 lbs., now deposited in the museum of the Imperial Mining-School at St Petersburg; and in the same year the total yield from the Russian gold works was nearly £3,000,000 sterling. In fact the gold districts of eastern Russia and Siberia comprise an area larger than France; and it is only within the past few years that Chinese Tartary, as well as Siberia, a tenth of the earth's surface, has been proved to be auriferous. Hence we may look for large returns from other regions besides California.

Among the schemes, too, for a route across the isthmus, no one appears to remember Mr Lloyd's survey made in 1828-9. He was commissioned by General Bolivar, and carried levellings across at the points now considered as the most desirable; the commencement of the work being marked on a stone on the shore at Panama, and the termination on the stem of a tree at Chagres. The 'Philosophical Transactions' for 1830 contain an account of the whole proceedings.

Prospectuses are issued for a 'Panopticon of Science and Art,' a sort of rival Polytechnic Institute, originating, it is said, in a bequest of £20,000 left for the purpose. Several houses adjoining Exeter Hall have been purchased, and are to be cleared away to provide a site for the new edifice, which is to be opened next Christmas. Besides this, cheap gas and cheaper water are much talked about: one projector proposes to form a reservoir by erecting a dam across Dovedale, and thus to supply London with pure water brought in pipes all the way from Derbyshire. But to detail all the topics of London talk would require more than two or three brief columns; I must therefore close with the fact, that amidst the various claims of model lodging-houses, new streets, abatement of nuisances, and public slaughter-houses, Mr Layard's 'Nineveh' is most highly esteemed, and competes successfully with Macaulay's 'History' as the book of the season. Though not a politician, the author is acknowledged to be one of the first men of the day; and it is a source of regret that government has granted no more than £1500 to enable him to resume his interesting excavations.

INCIDENTS OF CANADIAN TRAVEL.

It was on a fine morning in the month of June, a few years ago, that I stepped on board the steamer 'Canada,' just as she was about to leave the wharf, on her way up the river, from Quebec to Montreal. Their steamboat architecture has recently much improved on the St Lawrence; but the Canada was one of the old, clumsy, and gaudy race of boats at one time so common on the inland waters of America. She had been constructed, like all her fellows, without much regard to proportions, her hull being scarcely visible, from the extent to which her double tier of decks projected over her sides. Behind two enormous funnels, which were simultaneously ejecting dense columns of flame, sparks, and smoke, the 'working beam' rose high above the upper deck, and when in operation, was one of the most striking features in her singular *tout-ensemble*. Seen from a little distance, she appeared like a huge concoction of Bristol-board and paint, the ground-colour being white, with jet-black stripes traversing her whole length along the most prominent lines of her frame. To one accustomed to the sight of a British-built steamer, it seemed as if the slightest breeze could have reduced her to her original elements; and as the hot steam shot shrieking from the escape-pipes, you felt her shake like a jelly beneath your feet.

Having no further occasion for delay, we steamed with all speed up the river. The tide being in our favour, we were soon extricated from the labyrinth of ships anchored in the stream—each being surrounded with its small raft of timber, with which the crew were busily loading it. Thousands of men being thus simultaneously at work, there was something indescribably cheerful in the songs with which they lightened their labour.

As seen from the river, Quebec has a most imposing appearance. The bold promontory, crowned by the battlements of the citadel, rises like a perpendicular wall immediately behind the lower town, which nestles at its feet, and which it has the appearance of crushing into the water. The spires and roofs of the upper town, covered with tin, and glistening in the sunshine, are seen peering over the fortifications, the only connecting link between the two towns, on the St Lawrence side, being a zig-zag street, appropriately called

Mountain Street, which struggles up a cleft in the rock. In some places the battlements of Cape Diamond seem to impend over Champlain Street, a long and narrow street, which leads to the western extremity of the lower town.

Immediately on passing the city, the river expands to nearly treble width. Both banks are very lofty, that to the south sloping down to the water's edge, and being covered with the richest foliage. The north bank, on which the city stands, is rugged, precipitous, and almost naked. At the end of Champlain Street are many building-yards, in some of which, as we passed, vessels were on the stocks, and nearly ready for launching. Then came the 'coves,' as they are called, and which are neither more nor less than those portions of the beach on which the great timber merchants transact their business. Wolfe's Cove is about two miles above the town, and is the spot at which that gallant general struggled with his army and artillery up an almost perpendicular cliff, to gain the plains of Abraham above, on which he afterwards lost his life, fighting the decisive action which struck the last blow at French dominion in America. These coves follow each other in close succession for nearly three miles, the whole beach being lined for that distance with vast quantities of timber, squared, and ready for shipping.

There are similar coves on the other side of the river, about seven miles above the town, where the Etchamin enters the main stream, on its southern side. At the mouth of this tributary we passed a series of saw-mills, erected on a most gigantic scale, and in which the largest logs are converted, almost in a twinkling, into slabs, beams, deals, and scantlings. On the wharfs which surrounded them, the produce of these mills was piled in enormous masses, ready for conveyance to Europe in the vessels anchored hard by. Two miles farther up, the river receives, on the same side, another tributary, called the Chaudiere. The Falls of the Chaudiere, which are not more than a league from its mouth, are far superior in size and grandeur to those of Montmorency, nine miles below Quebec. And yet there is not one traveller in twenty who sees the former, although only twelve miles from the city, whilst almost every stranger thinks it necessary to pay a visit to the latter. The Chaudiere, at its mouth, is spanned by a noble bridge of one stupendous wooden arch, somewhat resembling in its construction the centre arch of Southwark (iron) Bridge. It springs from rock to rock at a great elevation above the stream; and as we passed, its complicated frame looked, in the clear morning air, like light gossamer-work suspended from the foliage which richly mantled the two banks.

The town of Three Rivers is at the head of tide-water, on the north bank, the tide thus flowing for nearly 500 miles, or nearly the whole length of Great Britain, up the channel of the river. The banks here are comparatively low, and continue so, with but little exception, up to the great lakes. A few miles above Three Rivers we entered Lake St Peter, a broad and magnificent sheet of water, resting on a shallow and ever-shifting bottom. The changes which are constantly taking place in its navigable channel render it the most precarious point in the navigation of the river from the Gulf to Montreal. At its upper end it is studded with islands, some of which are made the basis of great government works, with a view to straightening, deepening, and rendering uniform its channel. About the middle of the lake we met an enormous raft from the Ottawa, making its way slowly towards Quebec. It was covered with small sheds, for the accommodation of the lumber-men who navigated it, and looked prickly with jury-masts, to each of which was appended a sail. These rafts sometimes encounter rough weather in Lake St Peter, which in numerous instances shatters them to pieces, and leads to melancholy loss of life.

It was early next morning that we approached Mon-

treau. The country was exceedingly rich, and radiant with all the glories of 'leafy June.' Its general character was flat, but here and there from the vast level plain, which extended on both sides as far as the eye could reach, small isolated and conical hills rose to a moderate elevation, to relieve the scene from the monotony which else would have characterised it. It was fully an hour before breakfast-time when we made fast to the noble stone quay which lines the river in front of the city.

While Quebec owes its chief celebrity to its commanding military position, Montreal has few advantages in a military point of view, the strongest piece of fortification about it being on the island of St Helen's, a little below the city, and about midway between both banks of the river. It is, however, admirably situated with a view to the requirements of modern civilisation, which looks more to good commercial than to military positions. Although situated upon a large island, it may be said to occupy a position on the north bank of the river, the main stream running between it and the south bank—that which sweeps around the northern side of the island being comparatively insignificant. Occupying the very centre of a vast and exuberant agricultural region, it is the point upon which four great natural highways converge, leading from regions as varied in circumstances as they are great in superficies. The site which it occupies is but about thirty miles below the confluence of the Ottawa and the St Lawrence—the former leading, for miles counted by the thousand, from the very heart of the territories of the Hudson's Bay Company; and the latter from the great lakes, with all the yet undeveloped wealth of the far north-west countries in the midst of which they lie. To the south, the Atlantic is directly accessible to it by the route of Lake Champlain and the Hudson; whilst to the eastward it can reach the ocean, by following the river to the gulf. This is the spot which, within the last few years, has been selected as the capital of United Canada; and few capitals have a situation affording so much promise for the future.

Montreal has a fine appearance when approached by steamboat from La Prairie; a small French-Canadian village several miles from it, on the opposite bank. It is chiefly built of stone, as are Quebec and Kingston—the three forming in this respect a marked exception to all the other towns of the province, and to nearly all in the United States, in which the wooden is almost invariably superseded by the brick tenement. The French portion of the city is very characteristic. The new part, all of which has been added since the conquest, has more of an English aspect about it; and some very magnificent streets and terraces have been added to it since its selection as the seat of government. The finest building by far which it contains is the Catholic cathedral, which is second only on the continent to that of Mexico, and of which any city in the old world might be proud as an ornament. The small hill immediately behind the town, and from which it derives its name, screens it completely from the cold northern winds. The slope which descends towards the city is covered with villas and orchards, and having a southern aspect, it produces the most luscious fruits. From the summit of this hill the view is very superb, commanding the city, the river, the Rapids, and a vast region of fertile country beyond.

The Rapids of the St Lawrence! who, within the domain of intelligence, has not heard of these stupendous phenomena? They needed not the muse of Moore to spread their fame: they are too gigantic in their sweep—too impetuous in their flow—too mighty in their power—too terrible in their aspect, ever to be forgotten by those who have once beheld them. As I was hurrying to the upper country, I had but a few hours to spend in and about Montreal, of which I took advantage to cross to La Prairie and see the Rapids of La Chine. The main rapid is almost entirely

screened from the city by some islands, which here break into different channels the great body of the stream. La Prairie, which is about nine miles from Montreal, lies at the foot of the Great Rapid, which rolls in tumultuous grandeur between one of the islands and the south bank of the river. The steam ferry-boat, in crossing, had to stem a portion of the rapid, but only where the delirious waters had subsided into comparative quiescence. Below, all was smooth and quiet; above, all was noise, tumult, and commotion. The river appeared to be rolling down the broken fragments of some gigantic staircase; and as it leapt maddened from rock to rock, the deep-blue current dashed itself into masses of foam, which for miles up covered its surface, like so many snow-wreaths borne down upon the tide. It is impossible that, in the presence of such a scene, even the most stolid and unimaginative can escape being struck with awe. The first feeling which it inspires is that of terror, the troubled flood seeming to bound onward to overwhelm you. Once assured by a sense of security, the mind becomes divided between amazement and self-humiliation; for you cannot avoid contrasting your own weakness with the stupendous development which nature here vouchsafes of her power. This is not the greatest rapid of the series, which, with some interruptions, agitate the river for the next hundred and fifty miles up, but it is in some respects the most terrible to encounter.

Having determined to ascend the river in a 'Durham boat'—a trafficking vessel which visits the upper country for flour—I set out, in the first place, in the stage for La Chine, in order to avoid the tedium of the first canal ascent. Here I found about twenty Durham boats ready to proceed on their upward voyage, but having no favouring wind, they were to be towed up the lake by the mail steamer. There being nothing novel in this part of the journey, I preferred the steamer to the Durham boat; and it was about noon when the 'Swan' started for the head of the lake, with a little fleet of cygnets behind her. Lake St Louis, now entered upon, is the result of the confluence of the St Lawrence and the Ottawa. It is a small body of water for these regions, but it is surpassingly beautiful, being studded with islets, covered with shrubbery dipping into the lake, so that they seem to be afloat upon the water. At its head the Ottawa enters it by a broad and placid estuary, stretching off to the right, and flanked by lofty banks, the St Lawrence bounding into it on the left through a screen of islands by a series of raging rapids called the Cascades. On getting ashore, it was with no little interest that, standing upon a small rocky point, I witnessed the first intermingling of the confluent waters of these two mighty torrents.

The Cascades being impracticable to upward-bound craft, they are turned, as on the La Chine Rapids, by a short canal, which leads into still water above them. Here, for the first time, I betook myself to the Durham boat, which was 'polled' close along-shore by the crew, until we reached the lower end of another series of rapids called the Cedars. These being practicable, first brought me in contact with the peculiarities of the navigation. A strong rope was attached to the boat, by means of which we were pulled by eight lusty oxen, which slowly scrambled along about midway up the high sloping bank to our right. They were attended by two Canadians—one to drive them, the other walking immediately behind with a large, sharp, and trusty knife in his hand, from which the sunlight every now and then flashed in our faces. I was about to inquire the object of this formidable armament, when an alarming incident furnished me with ocular demonstration of it. We were close upon shore, but the current which we had to stem ran prodigiously swift, although but little broken on the surface. Twenty yards farther out, however, it was roaring, and covered with breakers. The great point in steering was to keep the boat's head direct to the current. We had nearly mastered the rapid, when, by some unfortunate accident, her head

was allowed to tend slightly outwards. The current thus caught her broadside, and brought the oxen in their snail-like course to a stand. The confusion on board was only equalled by the hullabaloo raised by the two Canadians ashore, who, in an incredibly short time, exhausted all the oaths in their fertile vocabulary. In vain did the driver urge the oxen to their utmost efforts; the resistance was too great, and they could not move. In the meantime, by the action of the current, the boat was being driven farther out into the stream, until at length the oxen failed in their powers of resistance, and began to give way. They had been dragged backwards and downwards about three feet, when the man with the knife sprang to the rope, and in a twinkling severed it in two. The cattle were thus saved; but the boat, abandoned to the mercy of the current, shot, stern foremost, like an arrow down the stream, tossed about amid foaming breakers, which now and then dashed upon her deck. So suddenly did all this happen, that for a moment or two I felt as if awaking from a trance. Trees, banks, bushes, houses, every fixed object ashore, seemed reeling around me, as if in the delirium of some fantastic dance. The great anxiety of the crew was to prevent her from shooting the Cascades, which were within sight but a short distance below. At one time it appeared in the highest degree likely that she would do so.

'Stand to your oars, and be ready to put her head about,' cried the captain.

The men obeyed, ready to turn her round as soon as she was in smooth water, so as to shoot the Cascades safely and in regular style. Fortunately this was not required, for at the foot of the rapid she swung into an eddy, which enabled her to gain the shore.

'What would have happened had we gone down the Cascades?' I inquired very simply of the captain, who was already giving orders for reascending the rapid.

'We should have been back again in Lake St Louis by this time,' he replied with an air of great indifference, leaving me lost in wonderment at his estimate of the greatest calamity contingent on such an event.

We were not long in making up lost ground. The oxen were once more attached to the boat, and by dint of better steering we soon mastered the Cedars. The channel of the river is here again broken by numerous islands, between which it passes with prodigious force and velocity. Close to the southern bank, some miles off, are the Rapids of Beauharnois, which showed us their white crests until hidden from view by a sudden bend in the river, which brought us to the village of the Cedars. From this, up to the foot of Lake St Francis, we were alternately polled and towed, ascending several minor rapids, and flanking, by another very short canal, one too formidable to be breasted, and which formed on one side the defence of a small fort which rested upon it, and which, on that side at least, was impregnable. At the village at the foot of Lake St Francis we passed the night.

Next morning, as on Lake St Louis, a whole fleet of Durham boats were towed up Lake St Francis by a steamer. This is a somewhat larger sheet than the other, its upper half being very much broken with islands. On one of these, near the boundary line between the upper and lower provinces, is a rude pyramid of unhewn stones, raised by the Highlanders of the border county of Glengarry in honour of Sir John Colborne, who crushed the insurrection in Lower Canada in 1837. After sailing through many beautiful and mazy passages at the upper end of the lake, we arrived at Cornwall, the first frontier town of the upper province.

Twelve miles above Cornwall is the greatest and most formidable rapid of the St Lawrence, known as the Longue Sault, or, as it is commonly called, the Long Soo Rapid. Hitherto we had come along the northern bank; but to overcome this rapid we had to cross the river, the only practicable ascent being on the southern side. The stream was narrow where we crossed,

and the point aimed at was the mouth of a small rivulet on the other side. We ascended the still water on the northern side, until we got nearly a mile above this point. The men then took to their oars, and pulled lustily across the stream. As soon as we touched the impetuous current in the middle, we were swept down with amazing rapidity, until we got into still water again on the other side, about half a mile below the rivulet, to which we were then leisurely polled up.

The rapid being still a mile or two up, I walked along the beach, leaving the boat to be polled to the foot of it. In doing so, I bounded over the rivulet which crossed my path. That bound brought me from monarchical to republican jurisdiction—the boundary line between the province and the United States here intersecting the St Lawrence, the broad current of which henceforth intervenes between the rival jurisdictions. I embarked again at the foot of the Great Rapid, which, in all its appalling grandeur, was now in full view. As at all the rapids, islands here also blocked up the channel, the river escaping with terrific violence between them. The broadest and most fearful rapid was on the Canada side, some distance from us. The channel on the American side, which we ascended, was narrow, and comparatively tranquil; but the strength of the current may be estimated by the fact, that it took no less than twenty-eight oxen to tow an empty boat against it, keeping quite close to the shore. The rapid is in all twelve miles long, and it took us some hours to ascend it. We were almost at the top, when I was favoured with a sight for which I had yearned—that of a boat shooting the rapids. Doubling a point of the island to our right, and emerging, as it were, from the trees and bushes, which seemed to hem in the still water above, came a boat, on her downward voyage, laden with flour, a tier of barrels being upon her deck. For some distance before the rapid broke, the current was swift and powerful, although the surface was smooth. Down she came, faster and faster every moment, as the current became stronger. No human power could then have stopped her course, or saved her from the rapid. The crew stood motionless, each at his appointed post. Having reached the line where the rapid broke, she made one bound into the troubled current. Her prow was every now and then buried in foam, and twice—and again did the water wash over her deck, as she was hurried past us, like an arrow on the omnipotent stream. My eye followed her, until a point below concealed her from view. It was like a dream. Almost in a moment she came and disappeared. I had scarcely withdrawn my eye from the spot where I last saw her, ere she would be riding safe in less troubled waters at the foot of the rapid.

It were needless much further to prolong this recital. At Dickenson's Landing, which is at the head of the rapid, on the Canada side, we passed another night. Thence we next day ascended to Prescott, encountering many smaller rapids, up which we were towed. The channel was thickly strewn with islands the whole way up to Prescott, at which town my journey by the Durham boat terminated, this being the place at which it received its cargo for Montreal. The neighbourhood of Prescott was the scene of one of the most sanguinary conflicts that took place in the upper province during the rebellion in the winter of 1837–38—a Pole, of the name of Von Shultz, having landed with some hundreds of sympathisers from the American town of Ogdensburg, directly opposite, and taken possession of a wind-mill a few miles below Prescott. From this they were dislodged after a sharp engagement. Von Shultz was tried at Kingston as a freebooter, and hanged.

The steamer by which I proceeded from Prescott to Kingston crossed over to Ogdensburg on her way up. It was the first American town that I had seen, and left a very favourable impression upon my mind. It is situated at the mouth of the Oswegatchie River, the waters of which are deeply tinged by the masses of vegetable decomposition through which it flows. From

this to Brockville, on the Canada side, and twelve miles up, the river is clear of islands, and has the appearance of a large lake. Great is the change, however, immediately above this town, which lies at the lower end of the far-famed 'Thousand Islands.' I shall say nothing of them at present, as to do them justice would require more space than is now at my disposal. It was evening ere we reached Kingston, at their upper extremity. Here my eye rested upon what appeared to be the broad and boundless ocean, quietly ruffled by the evening breeze, and over which the setting sun threw a brilliant pathway of ruddy light. It was Lake Ontario, the smallest, and the last in the order in which they lie, of that wonderful chain of lakes which drain into themselves one-half of a continent. I remained for some time gazing upon it in mute wonder, as I thought of its vast proportions and the illimitable regions to which it led.

The distance from Kingston to Toronto is 180 miles. This was prolonged by the steamer touching at Oswego, on the American side of the lake. From Oswego we took an oblique line across to Coburg, a Canadian town. During this part of the voyage we were for many hours out of sight of land. Think of that, reader; out of sight of land on a fresh-water lake! Even to this one becomes accustomed in America, as I did afterwards. The distance from Coburg to Toronto, which is seventy miles, is accomplished during the night. Toronto is still fifty miles from the head of the lake. Arrived at my destination, I took up my quarters at the North American Hotel, where I rested for several days, after a journey novel and varied in its processes, and replete with incident and interest.

HISTORIC TABLEAU.

FROM THE FRENCH OF X. B. SAINTINE.

It was Saturday, the last day of August 1483. In a gloomy castellated mansion on the banks of the Loire, not far from the city of Tours, five persons, each of a very different aspect from the other, were assembled in a large apartment, hung with gilt leather, and more abundantly furnished with arms, vials, and relics, than with articles of comfort or of luxury. This dreary chamber was only to be approached by a narrow staircase, which wound its way through the massive wall. A pale, worn sufferer, with a haggard and restless eye, lay stretched upon a couch. At one side of him a venerable hermit knelt in prayer; at the other stood a physician, immovable as a statue, with his forefinger pressed upon the pulse of his patient. Two others stood in a distant corner, silently observing what was going on, or now and then conversing in subdued whispers, or by the silent interchange of looks.

The first of these, of middle stature, and in the prime of life, united with an air of frank good-nature an expression of acute intelligence and clear-sightedness. He held an inkhorn in his hand, as if ready to write from dictation. He might have been taken for a notary, had it not been for the rich robe of black velvet which formed his attire, and the chain of massive gold which hung around his neck. The second, a man of tall stature and spare form, with a bald head, and a countenance expressive of mingled cruelty and cunning, stood with his arms folded, as if in the deepest anguish, and his thick shaggy eyebrows closely knit, whilst every now and then there burst from him a deep-drawn sigh.

There was yet another being, another sufferer, in the room. Will it, however, be seemly here to speak of him?—for he was but a greyhound. He lay in a corner, on a little bed which had been made expressly for him—for his master loved him well. Both had been equally devoted to the pleasures of the chase, and both had been taken ill on their return from a fatiguing course. The dog, like the rest of those who were present at this scene, kept his eyes intently fixed upon the patient; whilst the latter, turning apprehensively from the gloomy and foreboding gaze of the physician,

glanced towards the dumb animal, and exclaimed with peevish impatience, 'Can we not contrive to get up a death-struggle between the cat and the rats, as we did yesterday, to divert my good greyhound and myself, and to keep us awake? Oh what agonies I am suffering!' he suddenly exclaimed, writhing upon his couch. Then turning towards the hermit, he continued, 'My father, pray to God to alleviate my sufferings. He only can. Even if He will not show this favour to me, He will do it for you, who are a holy man, and have never offended Him as I perhaps may have done. Pray to Him, father—pray very devoutly; He surely will not be able to refuse you anything.' And deep sobs mingled with the paternosters of the hermit, as he bowed his head in supplication, and earnestly besought of God and St Eutropus that they would assuage the sufferer's anguish, and restore to him the health of the soul as well as of the body.

'That of the *body* for to-day; speak only of the body, my father,' said the sick man, laying his wasted hand upon the hermit. 'When one wants very much to obtain anything, one must not ask for so many things at a time.'

The monk obeyed; but the sufferings of the patient continuing in unabated force, he now turned towards the physician.

'Cannot *you* help me, my best friend?' he exclaimed. 'Oh, for pity's sake, do give me some relief: you are my only hope. I have already made you rich and honourable, I will make you richer still; but do not look at me in that way, or I shall think what I *would* not think! Unknit your brow, and rejoice in your good fortune; for by'r lady, for every month you keep me alive from this day forth you shall be paid, not, as heretofore, *ten* thousand crowns, but *twenty* thousand; yes, and more even if you require it.' The physician, apparently unmoved by all these brilliant promises, held a bottle of smelling-salts to the nose of his patient, and administered to him a few drops of some narcotic mixture. For a brief moment the sufferer seemed relieved, but it was not long before his sufferings returned with aggravated power.

'The relics!—the relics!' he exclaimed, turning anew to the saintly man, who still knelt by his couch. The monk, having made the sign of the cross, reverently approached a rich reliquary which lay on a small table in the centre of the room, and made the necessary preparations for charming away, by its touch, the sufferings of the patient. For this purpose it was necessary to lay it gently for a moment on the sufferer's head. The monk was feeble and attenuated—less perhaps by age than by continual fasting and self-mortification. He required assistance. He raised his eyes timidly towards the physician, who stood facing him at the other side of the bed: the latter only replied by contemptuously shrugging his shoulders, and with a scornful smile quitted his post by the bedside, where, however, he was quickly replaced by the man who wore the inkhorn by his side.

'If I recover through your means, oh, my holy and most powerful relics!' exclaimed the patient, 'I will erect to your honour a church, in which every one of you shall have his chapel; and there you shall repose in pure gold, studded with jewels, and prayers and invocations shall continually be offered at your shrine.' Then suddenly interrupting himself, he exclaimed in a hurried voice, and as if gasping for breath, 'The potion! the potion!'

A moment of calm now supervened. He sought to deceive both himself and others, and his courage and confidence in himself and in his destiny seemed suddenly to revive. 'Why should I die of this stroke?' said he: 'am I then so very old? That dog which lies there looking at me out of the corner, and which was ripped up by the stag—he is yet worse than I am: he is not possessed of all the appliances and means for the recovery of health with which I am surrounded: none pray for him. And yet they say *he* will recover. Well, then, *I* too will

recover! I swear by the blessed Virgin I *will*! It is the want of air and of nourishment which is killing me: it is this confinement to my couch which turns my brain! I will rise and take a turn in the gallery, or breathe the fresh air; or else I shall go, I think, into the town, and show myself to the people—not as a miserable invalid, but in my hood and doublet of crimson silk, lined with ermine; or, better still, my rich dress of cloth of gold: it cannot be much worn, for I only used it once—yes, the day I went to meet the lord high constable. Let it be brought to me directly; and order my horse to be saddled; let him, too, be richly caparisoned with his Persian embroidered housings. You, my good friends, can come along with me, and in case I should need a little support, will lend me a helping hand. Come, let us lose no time.'

Those whom he thus addressed took all these vain words for a passing delirium; but with a movement of impetuous haste he threw off his bedclothes, and sprang from his couch. The faithful greyhound, perceiving this unexpected movement, raised himself, not without effort, from his bed, and hastened with feeble steps towards his master. But weak as were the demonstrations of joy which the poor animal could at this moment show, even they were too much for the exhausted frame of the sufferer: he stumbled, and sunk fainting on the floor. The monk gently lifted him to his couch, whilst the unconscious offender was driven rudely to his bed. When the patient recovered from his swoon, he peevishly exclaimed, 'It was that accursed greyhound which tripped me up; but I will make another attempt.'

'You must not stir!' cried the physician in a tone of command which kept him passive as a child; whilst, as he looked on all around, and saw consternation and dismay in every countenance, a pang of anguish shot across his heart, for he felt that the fatal hour was at hand.

If ever man feared *death*, it was he who now lay on that bed of anguish. The very word was so hateful to him, that he had long forbidden it should be uttered in his presence. And yet, for the sake of his soul's safety, he did not wish to allow this dreadful hour to come upon him unawares. He therefore signed to the man with the inkhorn to approach him, and bend over his couch. The latter obeyed; and the sufferer, gasping for breath, feebly whispered in his ear, 'My faithful servant, it is *possible* that this illness may end badly for me; but I do not wish that the news should be conveyed to me in any other way than that on which we have already agreed; and if—in a few weeks—in a few days—perhaps—I should be in danger of—may God avert such an evil!' he added, interrupting himself—'remember only to say those few words, "Speak but little!" that will suffice.'

Whilst he thus whispered his wishes to his confidant, the physician was engaged in conversation with the bald-headed man whom we before noticed standing in the corner. This latter now approached the sick man's couch; and as the restless sufferer turned from his friend, he beheld this pale and sinister countenance bending over his pillow, and heard this voice, more harsh than sorrowful, saying to him, almost without preamble, 'Neither prayers nor remedies can longer avail you aught; you must prepare yourself to die in a holy manner, as all good Christians should do. The event is inevitable, and probably near at hand. It is to me a painful duty to announce it to you, as it is doubtless to you a painful task to—' The dying man, with a shudder, turned in his bed. His eyes were haggard; his lips compressed with rage; and he darted upon the speaker such a look of concentrated fury and despair, that he caused him to pause in his speech. A moment of awful silence ensued, which the sufferer was the first to break.

'I am not yet,' said he, 'fallen so low as you seem to think. Besides, had I only two moments to live, *here* I am the master, and I can still punish whosoever has

dared to disobey me, and to dispute my will. Yes! I swear it, on my soul's salvation, amongst those now present it is not I who shall be first to die!' As he thus spoke, he raised to his lips a small silver whistle which hung suspended near his bed. The monk laid his hand upon his arm, and said in a voice which was still firm, though expressive of deep emotion, 'And God! the Almighty God! do you forget that soon, very soon, you may be standing before Him?'

'God will grant me absolution, father, and so will you; for it is an act of justice which I am about to accomplish. This man has many a crime to answer for.'

'Sinner!' replied the monk in a tone of deep earnestness, 'it is God alone who has a right to be swift in executing His judgments! The justice of man should be slow, for he is blind and liable to err. Retract what you have said; if not, neither from God nor from me can you hope to receive absolution!'

The dying man listened in gloomy silence; and after a moment of reflection, replied in a voice which was more subdued than before, but which yet betrayed ill-suppressed passion, 'And this oath, on which I have staked my salvation; this oath! I cannot break it without risking my share in the joys of paradise.' And raising himself with much effort, he exclaimed in a resolute tone, 'This oath! I will fulfil it; I ought to do so, and I shall!' The monk had fallen upon his knees with his hands clasped; his companions gathered around the couch with an air of supplication. The proposed victim alone, the man with the bald head, stood immovable, his countenance impassible, and seemingly prepared to brave the danger. And yet it was evident that he was well aware of the imminence of the peril. His death-like paleness, and the cold dew which hung upon his brow, proved that his calmness proceeded rather from terror than from resignation. The expiring man fixed upon him an eye whose expression was that of power and of malignity. 'I have sworn,' he exclaimed, 'that amongst the living beings in this room I shall not be the first whose breath shall fail.' Then pointing towards the corner where the poor greyhound lay crouching on his bed, he said in an authoritative tone, 'Take that dog, and let him be put to death this moment.' The man with the bald head did not wait for the order to be repeated a second time, but taking down a club which hung against the wall, he struck the dog violently, but with an uncertain hand. The unfortunate animal howled piteously, and was struck three times before he received his death-blow.

'Good Heavens! how he makes him suffer!' exclaimed the dying sportsman as he sunk backwards on his bed, his countenance betraying at the same time an unwonted degree of emotion.

'My son,' said the hermit, 'even the death of this dog is an act of guilt which you must expiate by a speedy repentance!'

'If God reckons the death of *this* animal amongst my sins, what may I not then expect?' murmured the sufferer in a feeble voice. 'Of this sin, father, I do indeed repent; for I loved this poor dog. We had often been companions together in the chase; and I cared so much for him, that I have had him nursed here under my own eyes. I have at least this conviction with regard to him, he is the only being amongst those lives I have taken away who never once offended me. As an expiation of my offence, I desire that his form may be sculptured upon my—you understand me? Yes, sculptured in marble, and placed by my side. Now, father, receive my confession.'

From that moment the thought of death no longer seemed to press upon the mind of this still formidable sufferer; he recovered all his collectedness and sang-froid; he passed a long time in dictating instructions concerning his last wishes to the man who bore the inkhorn by his side; made his confession to the monk; and towards eight o'clock in the morning, after having discoursed long and wisely on the course to be pursued

with regard to politics in France, he passed from time into eternity, and the hermit closed his eyes.

This hermit was St François de Paule; the physician, Jacques Coitier; the man with the inkhorn, Philippe de Comines the historian; the man with the bald head, Olivier le Dain, surnamed Le Diable; he who had just gone to his long account, the king, Louis XI.

Amongst all the dying wishes of this once absolute sovereign, but one, that which related to his dog, was religiously executed. In the church of Notre-Dame de Clévy, near Tours, a marble monument represents Louis XI. in the costume of a hunter, kneeling upon his tomb, his white greyhound by his side.

ROBIN CARRICK.

A Scotch country paper—the 'Ayrshire News Letter'—presents a biographical sketch of Robert Carrick, a merchant and banker who flourished in Glasgow half a century ago. Robin, as he was familiarly called, was the son of a clergyman, and began life as a clerk in a banking-house in Glasgow, in which he ultimately rose to be a partner, after which event the title of the firm was 'Carrick, Brown, and Company.' This concern, located in an old dingy building at the corner of Argyle and Glassford Streets, united the business of manufacturing muslins with those of banking and bill discounting. As is usual with Scotch banks, the company issued notes of a pound and upwards. We have a distinct remembrance of these notes; they were printed in blue ink, with the picture of a ship in full sail in the corner, and obtained a wide circulation. The firm issued no small number of notes on its own account, by paying them away to weavers and others employed by the company in their muslin manufacture.

The apartment in which the banking business was carried on was meanly furnished with a couple of plain deal desks, and a kind of barrier with a slip of flat board which served as counter. The notes were kept in pigeon-holes in one of the desks, and were not seen by customers; for when the desk was opened, the lid was supported by the head of the clerk, and this operation screened the interior from too curious observation. These details are significant of the great difference in the style of money-dealing in past and present times. A similar simplicity of arrangement prevailed among the old London banking-houses; and till the present day banking is conducted in much the same primitive manner in most continental countries.

Robin Carrick was the *beau idéal* of a steady, calculating, plain-living, old-fashioned Scotsman. His thin gray hair was tied behind with a black ribbon; his garments were ample, and of an antique cut; and his legs were encased in a pair of white ribbed woollen stockings. His mode of doing business, though consistent with perfect civility, partook of that degree of sly caution which the national dialect expresses by the word *paucky*. In his room, he sat on a high-legged stool at a wooden desk, with his feet resting on a cross bar; and when any person called on discounting business, he did not rise, but wheeled only half round, in order not to commit himself too far. When he declined to discount a bill, he always said with a bow and a cold smile, 'It's not convenient;' and never yielded to importunity, but became more firm in refusing the more the suitor pressed. To test the solvency of his customers, he was wont to disappear from Glasgow for some time; this enabled him to discover who could and who could not pay their bills without renewals, obliging all to carry their paper elsewhere. By these means many bad debts were avoided. Such absences he turned to account. He went privately to look at lands and estates that were for sale; and picked them up if they offered a profitable investment. His plan was never to buy good or improved land. He preferred purchasing extensive ill-reclaimed bogs, mosses, and wildernesses, where corn never ripened, and the farm-houses were turf hovels. With the eye of a connoisseur he knew what

tracts were susceptible of improvement by draining, fencing, and road-making, and these he bought if they were a bargain. In this way he purchased a great breadth of land in New Monkland, a bleak region within the north-eastern boundary of Lanarkshire; of course dispossessing a large number of small lairds and tenants, whose poverty and ignorance stood in the way of all sorts of improvement. Robin, be it observed, did not let it be known that *he* wanted to buy any property to which he took a fancy; had he done so, three prices would have been asked for it. He resorted to all sorts of manoeuvres, aided by confidential agents, and in these was generally successful.

Robin Carrick's housekeeping was conducted in the rigidly-economical style of a Scottish bachelor of the old school. He lived in the floor above the bank, to which there was access by a common stair entering by a door behind. His house was kept for him by a respectable female domestic; and from all accounts, this lady was as economical in her plans as her master. Sometimes—we should suppose not very often—Robin gave a dinner to a party of friends, and on these occasions his housekeeper bought a pound of old cheese, on condition that what the company did not consume should be taken back by the cheesemonger—a trait of parsimony pretty well known, but probably only relished as a joke on the rich banker's method of housekeeping.

So far go the facts which are given of Robert Carrick's career. He died a number of years ago; and the concern of which he was a member having latterly merged in a new joint-stock banking company, his famous ship-notes are withdrawn, and no longer seen by the public. At his death he left a large fortune, amassed by the means that have been mentioned; but what became of his wealth is not stated. With the exception of having once been a bailie and dean of guild, two offices in Scottish civic economy, it does not appear that he took any part in public affairs; and his historian is silent as to any services he performed in connection with social improvement. It would seem, therefore (for we know nothing of the fact), that, after all, this man—rich, 'respectable,' and with every possible opportunity of being useful in his generation—was a mere money-gatherer, a muck-raker of the most commonplace character. It is hard to say this of Robin Carrick. But we want to know what he did. Providence gave him the means of doing much, and did he do much? Did he devote his growing riches to objects of a nature which would benefit his fellow-creatures? Did he abundantly relieve the sick; bind up the broken-hearted; build and support schools; open up new and useful thoroughfares; erect wholesome dwellings for the classes condemned to live in the midst of filth and pestilence? The only good sort of thing that we have heard of him was buying land for the sake of reclaiming it; but when he cleared out the wretched inhabitants, did he help them to emigrate to more suitable fields of industry? If he did none of these things, his life, though not useless to society, must be pronounced to have been undeserving of commendation; he may be remembered as a millionaire, but that goes a short way in the summary of what constitutes the chief aim of existence.

The stupid money-making life of Carrick—supposing it to be confined to what his historian relates—is a fair specimen of the beginning, middle, and end of hundreds of lives of merchants, manufacturers, and bankers. First, there is much painful labour; then there is rapid acquisition; lastly, there is a large fortune, which the makers leave to be spent by persons who only laugh at them for their folly. To vary the insanity, they occasionally leave their hoards to build magnificent hospitals, which demoralise society, while they perpetuate the vulgar name of the founder; and which institutions, we may rest assured, will some day be swept away by law as public nuisances. Why, in the name of common sense and human experience, will not people make proper use of their money while

they live, instead of leaving it in a lump to be squandered thanklessly, uselessly, mischievously, when they are dead? Considering the frequency of fortunes being made only to be left at death, it would almost seem as if money-makers were not aware of the pleasure which might be derived from working out beneficiary and other plans under their own cognisance. Were men, on whom family obligations do not heavily rest, properly conscious of this fact, we think they would be inclined to expend at least a reasonable portion of their accumulations on objects of taste and public utility. We know of no locality which might not thus be greatly benefited at even a moderate outlay.

DUELLING MONOMANIA.

THE hero of the action we are about to record was Mr Mathew, the proprietor of the estate of Thomas-town, Tipperary, where Dean Swift paid a visit of four months. The rental of the estate was £8000 a year, and Mr Mathew desiring to spend the whole in the exercise of hospitality, had the resolution to live abroad for seven years at an annual expense of £600, that he might accumulate enough of money to build a commodious house for the reception of visitors. This house contained forty apartments for guests, where each might take his meals by himself, or invite his friends to join him. Or they might meet at a daily ordinary in the common parlour, where the only rule was, that there was no one master of the house. In addition to these accommodations, there was a place fitted up like a coffee-house, where the guests might obtain refreshments at any hour of the day; and likewise a *tavern*, where such of the guests as were addicted to intoxication might indulge themselves without the reserve which would be occasioned by the presence of more abstemious persons—among whom Mr Mathew himself was one.

When Mr Mathew returned from abroad, the duelling-mania was at its height. There were in London at that time—towards the conclusion of Queen Anne's reign—two gentlemen, a Major Pack and a Captain Creed, both of them accomplished fencers, who, hearing of the daily exploits in duelling which took place in Dublin, repaired to that city in quest of adventures. Here they learned that Mr Mathew had the reputation of being one of the first swordsmen in Europe; and Pack, firing at the news, insulted him by jostling one of his chairmen as he passed, and boasting of the exploit in a tavern as an affront which Mathew had not had spirit enough to resent. This brought about the desired consummation; and Mathew, accompanied by a friend, Macnamara, repaired to a tavern where they knew Pack and Creed were to be found. The sequel we give in the words of Mr J. B. Burke, in his recent work, 'Anecdotes of the Aristocracy.' 'After securing the door, Mathew and Pack drew their swords; but Macnamara stopped them, saying he had something to propose before they proceeded to action. He said that in cases of this nature he never could bear to be a cool spectator. "So, sir," continued he, addressing himself to Creed, "if you please, I shall have the honour of entertaining you in the same manner." Creed made no other reply than that of immediately drawing his sword. The conflict was of some duration, and maintained with great obstinacy by the two officers, notwithstanding the great effusion of blood from the many wounds which they had received. At length, quite exhausted, they both fell, and yielded the victory to the superior skill of their antagonists. Upon this occasion Mr Mathew gave a remarkable proof of the perfect composure of his mind. Creed had fallen first, on which Pack exclaimed, "Ah, poor Creed! are you gone?" "Yes," replied Mathew with the utmost calmness, "and you shall instantly *pack* after him," at the same time making a home-thrust quite through his body, which threw him to the ground. This was the more remarkable, as he was never known in his life,

either before or after, to have aimed at a pun. The number of wounds received by the vanquished parties was very great; and what seemed most miraculous, their opponents were untouched. The surgeons, seeing the desperate state of their patients, would not suffer them to be removed out of the room where they fought, but had beds immediately conveyed to it, on which they lay many hours in a state of insensibility. When they came to themselves, and saw where they were, Pack, in a feeble voice, said to his companion, "Creed, I think we are the conquerors, for we have kept the field of battle." For a long time their lives were despaired of, but, to the astonishment of every one, they both recovered. When they were able to see company, Mathew and his friend attended them daily, and a close intimacy afterwards ensued, as they found them men of probity, and of the best disposition, except in this extravagant idea of duelling, of which, however, they were now perfectly cured.'

AN ARTISAN EMIGRATION SOCIETY.

A HANDBILL has been brought under our notice purporting to be the 'Rules of the Wardour London and New York Self-Affecting Transit Society' (a name much too long and complicated), the object of which is, to afford means of emigration to artisans and their families. The locality of the association is Wardour Street, Soho—Thomas Shute, secretary, 24 Cecil Court, St Martin's Lane. We possess no means of judging of the respectability of the club, as it may be called; and our only reason for noticing its establishment is, to point out what a body of men propose doing on their own behalf. At the head of the rules is inscribed a proverb, by way of motto—'Help yourselves, and your friends will love you all the better;' and this wise saying is apparently significant of the principles on which the society is to act. The members seek no assistance from anybody. All they desire to do is, to gather up small weekly sums till enough has been accumulated to remove the members and their families *en masse* to New York. The payments are to extend throughout seventy weeks; during which each adult is to pay 1s., and for each child above four and under fourteen years of age, 6d. per week. The estimated cost of transit, therefore, appears to be L.3, 10s. for each adult, and L.1, 15s. for each young person; infants being free. Thus for a man and his wife the charge will be L.7, exclusive of children, which we believe is the usual price of a steerage passage to New York.

For the credit of the working-classes we hope the scheme will do well. It manifests an earnest self-reliant principle worthy of all praise; and the only thing wanting to its perfect success, besides steadiness in making payment, is the security of the accumulating fund. We trust that means are taken to prevent misappropriation of money, or any other of those irregularities to which associations of a humble class are too frequently exposed. To such societies men of respectability and capital might lend valuable assistance, if only by charging themselves with the safe custody of the funds. And what is this but saying that a mutual dependence, as well as a spirit of kindness, ought to pervade society. It is to be regretted that unworthy suspicions in many instances stand in the way of this intercourse, and these can be removed only by education and experience. Meanwhile, the institution of a society, chiefly, if not altogether, composed of artisans, affords a useful hint to workmen whose thoughts are turned towards emigration. Each man has only to save up 70s. to get himself carried to New York, where he will be in the way of obtaining employment. Of course, besides this sum, each individual will require to possess a trifle more, as well as clothes, bedding, and some other articles; but what thrifty family is without these necessities?

PROGRESS.

Progress is the touchstone of revolutions; but it does not accomplish itself in a day, nor dart forth as the lightning which illuminates space. Nations gain freedom by degrees. Liberty widens, and the base of power extends in proportion to the spread of intelligence. Every evolution of humanity brings out a new idea, and consecrates new rights: each has its destiny to fulfil. The laws ought neither to rush in advance nor pass abreast of manners, for then they would be chimeras or assaults.—*Léon Faucher.*

A SISTER'S VALENTINE.

Know ye that every flower that blows
A language hath, to rouse or melt;
That falls not on the outward ear,
But in the lonely heart is felt?

So I, a gentle *pensée*, come
A messenger of love to you;
Bearing a billet in my leaves
Of nature's thoughts transcribed in dew.

My mistress plucked me far away,
Beneath a bright and sunny sky,
And said, 'Sweet gem, with autumn's breath,
Like other flowers, thou shalt not die.

'Within my herbal thou shalt live;
To stranger lands with me thou'lt roam;
A little exile dearly loved,
And cherished for the sake of home.'

Yet now a mission she provides,
And sends me with my gentle art,
To fan the sweet and holy flame
That warms a darling brother's heart.

Then frequent thou my leaves peruse,
Examine closely, and thou'lt see,
In language of the flowerets writ,
That fond appeal, 'Oh think of me!'

THE PREVENTION OF EARTHQUAKES.

When the electric origin of earthquakes first occurred to me, I thought it quite possible to prevent them, if a metallic or other good conducting communication could be effected through the temporary, or permanent, non-conducting strata, so that the electric currents might find a ready passage. I found, subsequently, that this idea had actually been carried into execution. The Chevalier Vivenzio, at the latter end of the last century, being convinced that earthquakes were the result of electric discharges in the earth, through bad or non-conducting media, and probably borrowing from the lightning conductor, proposed to fix metallic rods, terminating in a number of points, like a brush, in the ground to as great a depth as possible. But a better method has been carried into execution. In Naples there is a pyramid erected before a church, under which is a deep well, with several mouths opening about the base. This was made that the water, being a conductor, might form a good electric communication between the strata through which the well is sunk, and thus, acting on the principle of a lightning conductor, draw off the fluid. In the city of Udine, wells and other excavations have been made for the same purpose, and also great numbers in Nola in the kingdom of Naples. The success of the attempts at Naples and Udine does not appear; but at Nola it seems most unequivocal, for that city was never known to be damaged by earthquakes.—*Polytechnic Review.*

POPULAR ERRORS REGARDING SUGAR.

Amongst the common errors entertained by the people in regard to the origin and causes of diseases, is that of supposing sugar to contain certain ingredients destructive to teeth, and thereby a promoter of toothache. Chemists have proved that beyond doubt sugar contains no properties that can act chemically on the bone, and no injury can arise in this respect from the use of it. At the same time they have discovered that the crystals, or particles of the sugar (when in a state fit for use), are of such a hard nature before being thoroughly moistened with the saliva, that they rub or scratch the enamel of the teeth when in the act of crushing it between the molars. This brings on the gradual decay of the teeth, and consequent toothache.

A 'PINCH' FOR THE QUEEN.

The 'New York Standard' having read in 'Jerrold's Weekly News' that 'Messrs Stiven and Son of Laurence-kirk had been appointed snuff-box manufacturers to the Queen,' not unnaturally concluded that her Majesty 'took a pinch,' and expressed surprise that 'this young woman,' who had 'enjoyed the advantage of a good education,' and was said to 'sing some,' and 'draw pictures worth stealing,' should 'not only be a snuff-taker, but carry a box!'

SELF-DEPENDENCE AND MUTUAL DEPENDENCE.

THE cement which, in a state of advancing civilisation, keeps human society together is mutual dependence; and this mutual dependence, although perhaps originating in social sympathy, is mainly sustained by community of interest. The degree in which mutual dependence exists indicates the point of civilisation reached by the community, and it affords a test of the probable stability of the government and prosperity of the people. The working of the principle may be likewise traced, it is true, in the tribes of the wilderness, and in the trained savages of some of the ancient republics; but in both it betrayed the restricted character that might be expected in conditions of society obviously not adapted for permanence. It was there the mutual dependence of a small community, surrounded by other communities which it supposed to be its natural enemies, and itself fated to be extirpated by conquest, or swallowed up in new forms of social life. In the present age, partaking of the character of a higher civilisation, and influenced by the catholic spirit of Christianity, it is more fully developed. Its circle, though not wide enough, is wider than before, and is widening still. It acquires strength from this enlargement; it feels stirring within a vitality it was hitherto unconscious of; and already half suspects that it is destined to girdle the earth.

From this we gather that mutual dependence is not innate, or similar to the gregarious instinct we find in the brute creation, but the result of experience, reflection, and intelligence. It grows with the growth and strengthens with the strength of society; it spreads itself throughout all the ramifications of life, moral, social, and political; and yet, so far from being destructive of *self*-dependence, as we shall endeavour to explain in the sequel, it is its surest safeguard. But there is one thing mutual dependence wants; and that is, a knowledge and recognition of its existence as a great social principle. At present, its influence is felt without being formally recognised; and the consequence is, that, acting, as it does, like an unaccredited agent, it is constantly liable to interruption from the circumstances of life or the passions of men.

If we only look closely at our state of mutual dependence, we shall be filled with wonder at the hardness of heart, or obtuseness of intellect, which permits the continuance of the hostile feelings that still exist in a society so thoroughly knit, so inextricably interwoven, as ours. Look at that party of men lounging beside the railway—idle for want of work, moneyless and friendless. They perhaps assisted in constructing the wonder on which they are gazing; and their eyes are perhaps now following the proud traffic that sweeps past

them on the line they themselves pioneered. What precautions do we adopt regarding them? Creeping over the lines in the dark, to tear up a small portion of the rail, would be to them only the work of a few minutes; and what horror would be the result! Hundreds of lives might be destroyed; and before the news of the catastrophe could reach the great cities, a pause of terrible expectation would take place in the communications of the country, which would be felt throughout the whole of her social and commercial relations. There stand these men, however, unwatched and uncared for, and there pass they on in their hunger and desperation. We are safe, for they belong to the same system of which we form a part. In a political convulsion, or a great class agitation, they might be our enemies; but in the ordinary circumstances of life, they acknowledge universally that law of mutual dependence on the protection of which we as universally rely.

The still more recent wonder of the electric telegraph is as completely at the mercy of the evil-disposed or the desperate. A single blow, dealt in the dark, cuts off a communication which we believe to be as secure and infallible as if it were protected by the most ingenious mechanical contrivances. To sever a thin wire is to neutralise one of the most brilliant and important of the inventions of modern times; and this wire extends, in the open air, over a vast line of country, and is almost everywhere accessible to the casual passer-by.

When we observe the brilliant appearance presented by our cities at night, where innumerable jets of gas illumine the streets, and make the interior of our dwellings almost as light as at noonday, it never occurs to us that a few blows of a mallet and chisel struck upon the main pipe, would at once reduce the whole to the darkness of the grave. Mallets and chisels are not scarce, nor are hands that can wield them, nor are bitter and blighted hearts fit to suggest the blow: but the idea never occurs even to the most unfortunate or the most depraved; and so the city blazes on, and the hymns continue to resound from the church, and the music from the hall, and the lonely hearts to brood in harmless despondence over their idle hands and useless tools.

We might place the public supply of water in the same category with that of gas, but a still more familiar illustration presents itself in domestic life. The maid-of-all-work is condemned to almost hopeless drudgery; and owing to the mechanical nature of her employment, and the roughness and want of finish we permit in it, she is far worse remunerated than if she only took a part in the distributed labour of the house. She eats and drinks, however; she sleeps at night; she is able to purchase the homely clothes of her degree; and so matters go on till a fit of illness renders her unfit for our purpose. What becomes of her then? We do not know. She goes forth, no one can tell whither,

We are ignorant whether she lives or dies—we never see her again. But suppose, before this occurs, the family desire to betake themselves for a month or two to the country: what do they do with their house and household property? Why, they leave all in the charge of this despised drudge, whose connection as a link of the family system is so slight and arbitrary, and sleep tranquilly at a distance of a hundred miles, undisturbed by the slightest suspicion of her unfaithfulness!

But all these are only negative instances of our dependence upon others: we trust to the various classes we have mentioned for *abstaining* from doing us injury. The active and positive instances, however, are still more numerous—so numerous, that to mention them is to describe the whole machinery of social life. On the railway we have alluded to, the passengers, flying along at the rate of forty miles an hour, have intrusted their limbs and lives to the skill and experience of two or three men of the lower classes, whose names they do not know, and whom they probably never saw and never will see in their lives. In a ship we lie comfortably in our cot, listening to the hurried footsteps of the sailors on deck, on whom we depend for safe guidance across the ocean. The roar of the midnight storm mingles with the sound of their footsteps, with the hoarse cries of the crew, and the creaking and groaning of the timbers, which are the sole barrier between us and the fathomless abyss of the sea. The ship rolls and staggers, now climbing the vast and almost perpendicular steep of a wave, and then plunging headlong into the trough below, as if seeking the bottom. What of that?—we are only passengers! In like manner, we loll lazily in our carriage while it is guided by our coachman through the tumultuous and dangerous streets of a great city; or if night has fallen upon the road we travel, and the progress of the vehicle is slow and difficult because of the darkness, we call to the man to ‘mind where he is going,’ and compose ourselves to sleep. We every day emulate the boasted heroism of Alexander, and trust our lives to our physician. In getting a prescription prepared at the apothecary’s, we see him selecting our medicine from among the poisons by which he is surrounded; and never suspect him for a moment of a want of knowledge, or even a simple carelessness, which might make the draught our last in the world. But the catalogue is endless. From the moment we open our eyes in the morning till we close them at night, our history is a series of such instances of dependence; and if we live in a city, when we draw the curtains around us, perhaps the last sound of which we are conscious is the roar of a fire-engine, as it passes at full gallop, telling of some accidental calamity, and of the headlong haste with which men are flying to stop its progress and succour its victims.

We have hinted that in order to derive the full benefit from this mutual dependence, it must be recognised, not merely by abstract reasoners, but by the people generally, as one of the great principles of social life. It is not enough that we lean upon our neighbours from habit or instinct: we must know and feel that we do so. Such knowledge and feeling will make us all of more consequence to each other, and draw nearer and closer the bonds of social union. But they will have another effect, which many will consider an anomaly: the *mutual* dependence thus recognised will strengthen our *self*-dependence.

Mutual dependence springs from community of interest, and can be sustained only by the reciprocation of rights and duties. No man can lean—not the highest

in the state—without submitting to be leaned upon in turn. We must all contribute to the common fund in one way or other: some by personal service; some by goods; some by money, which represents service and goods; some by the work of the hands; and some by the work of the brain: for the condition of our enjoying the rights of society is our performance of its duties. Self-dependence, therefore, so far from being inconsistent with mutual dependence, is one of its essential elements. For this reason the recent ‘philanthropical’ tendency, alluded to on a former occasion, towards relieving the poor as much as possible from the care of themselves, is still more injurious to them than to the rich. Having no foundation in social science, the principle cannot last, and reactions are always dangerous, and often fatal. The unfortunate objects of this philanthropy are robbed by their *quasi* benefactors of their social rights; for it is absurd to suppose that these can be enjoyed by men who are absolved from the social duties.

We think it is in Locke that a remarkable illustration is given of the doctrine of rights and duties. ‘It is the *duty* of a king to protect his subjects: the king has a *right* to obedience from his subjects.’ The one condition depends upon the other: neither is binding alone. If the king falls a victim to treachery, and is unjustly deprived of his throne, it is impossible for him to extend protection to his people from the foreign country in which he has taken refuge. Are the well-disposed part of the people, then, still to obey? No: their right to the royal protection is lost through the force of circumstances, and they are therefore absolved from their duty of obedience. This is no doubt an individual hardship, but it is necessary for the common good; because if the claims of the sovereign upon his people continued to exist after he was unable to answer their claim upon him, the consequence might be, the subjection of the nation to foreign policy—perhaps eventually to foreign arms.

The same kind of hardship is felt in other grades of life. A man is thrown out of work by circumstances not under his own control; and he is forthwith placed as a pensioner upon a large fund wrung from the industry of the country to meet such exigencies. This fund is not expended in finding him employment, and thus maintaining him in the performance of the duties and the enjoyment of the rights of a citizen. It supports him as a public pauper, at once useless and offensive, and breeds hostility between him and that society on which he is a mere excrescence. This is a fearful hardship as regards the individual; and as regards society, a crime not inferior to the unjust deposition of the sovereign. But when the destitution is caused not by want of work, but inability to work, arising either from illness or age, the case is different. The man, having served the community till his power to do so ceased, either in the course of nature or by the visitation of God, has earned his pension, and has a right to enjoy it.

It will of course be observed that, in describing the system of dependence, we have not referred exclusively to the dependence of the rich upon the poor, of the employer upon the labourer; for the *condition* is obvious. The *quid pro quo* is exacted by those whose fortune it is to serve to the uttermost farthing—even up to their prospective pension from the community in the case of disease or superannuation. The fortune to serve, however, is constantly changing by the force of talent and industry, aided by circumstances. In numberless cases the servant becomes the master, the employed the employer—requiring a new adjustment of the social rights and duties. And so revolves the ‘whirligig of time,’ with a general equality resulting even from its alternating series of individual elevations and depressions.

Such views of society are neither new nor profound; but they are wholesome. It is too much the fashion to consider the rights of the poor as nothing more than a right to public beggary. This is gross injustice to the poor themselves, since, by absolving them from the social duties, it degrades them from the rank of citizens.

It subdues their spirit, enervates their manliness of character, and saps gradually the vital strength of the nation. The cause of the fatal mistake so often fallen into on this subject, is the forgetfulness of the fact, that there can be no right without a corresponding duty; that self-dependence is inseparably bound up in mutual dependence; and that both, in union, form one of the grand principles of social science. L. R.

COMMERCE HOUSE.

A TALE.

DECEMBER 184— had just commenced, and not a shop in the City Road but gave earnest of the approach of Christmas. The publicans issued handbills discoursing of forthcoming largesses of geese and spirits, resulting from divers weekly shilling instalments, and informing those for whom the announcement possessed interest that Smith or Jones was drawing the finest glass of ale in the United Kingdom. The grocers exhibited cartoons representing the 'Hearty Family' seated round a plumpudding of mammoth size, whose merits extracted, from the juniors especially, unreserved and rhyme-expressed eulogy. The cheesemongers displayed Stiltons and Cheddars, inscribed with toasts of a social, not to say convivial character, in addition to Leaning Towers of Pisa in cream cheese, and cottages with water-mills in the best Dorset. The chandlers, toymen, and confectioners contributed severally coloured candles; curious little presentable devices, like the underlined dramas at the minor theatres; and all-prize-and-no-blank Twelfth-Cake lotteries: shopkeeper and shop alike heralded in our great national festival.

Nor was Commerce House, the great drapery establishment of Messrs Tappolet and Beggs, less demonstrative of the impending occasion than its neighbours. The resplendent ribbons, and loveable neck-ties, with so remarkable a bias to ultra low prices; the diminutive and flossy parasols clearing out at 2s. 5½d.; no less than the cheap prints sacrificing at 1s. 11½d. the full dress; even to the disclaimer of connection with any other establishment, so vigorous and defined in its ink outline on the pasteboard ticket—all seemed to wear a jaunty holiday air, that rendered them unusually appealing to the heart and purse-strings of domestic servants.

It was an old-fashioned shop of ordinary dimensions, with nothing more noticeable in its appearance than a wooden beehive over the door, with a bee about to take wing on the threshold. The generally antiquated air of the place, the beetle-browed, drab-painted front, and the small panes of glass, presented a striking contrast to the placards wafered to the windows, announcing that 'in consequence of extensive robberies by confidential young men, realisation without regard to cost had been determined on; and that T. and B., vouching for every five shillings to give the value of ten, appealed to a discerning public to copy the address.'

That gentleman standing outside is Mr Sweeney Beggs, the junior partner; and a glance will suffice to show you that he is an oddity. Light hair of unusual length, sloping down his coat-collar, rigidly brushed back from the temples, and trained behind the ears; a lay-over collar, encircled by a wisp of black silk, slovenly to eccentricity in tie; a suit of black, and a colourless face, that, with something of a sinister expression, evidences considerable natural talent; such are his leading characteristics. The old-school-looking gentleman inside with the bald head, and some half-dozen hairs crossing it transversely, is Mr Tappolet; while a younger man farther in the shop, whose ingenuous and manly face impressed you favourably at first sight, is the worthy Mr Hadnum, 'the young man.' Mr Tappolet had been in business some thirty years in the same house; and only within a few months before our tale's commencement, had taken

Mr Beggs, heretofore a stranger to him, but who was understood to have been unsuccessful in the same line in the country, into partnership; and this he had done partly from a conviction that he himself was 'behind the time,' and partly from a desire that more active superintendence of the business than his own increasing infirmities permitted him to give should be exercised by a party equally interested in its welfare. Mr Beggs, apart from his business character, concentrated in himself the attractions of 'an ancient Forester,' 'a Druid,' 'a loyal united friend,' 'a benevolent brother,' and 'a total abstinent son of the Phoenix,' besides being a popular advocate of enlightened views, and a staunch friend of progress. In addition to these recommendations, he was of very agreeable manners, and entertaining in conversation; so much so, that if you had been giving a party, you would have been sure to have invited him. Since Mr Beggs's admission into the concern great external change was visible in its conduct—his favourite theory of an equal distribution of chattels being in part borne out by an innovating practice he had introduced of giving away certain articles of small value to purchasers of above a certain amount. While, under Mr Tappolet's sole management, Commerce House had gloried in the brightest window-panes and most burnished brass-plates, it had now of late absolutely revelled in an out-of-condition sort of appearance, which, if accounted for as in the case of books from circulating libraries, would seem to point to the large share of patronage enjoyed.

And now we must introduce the reader to a little shop nearly opposite Commerce House, whose occupant is cast for leading lady in our brief drama. It is a little suggestion of a shop, of amphibious description, combining the tobaccoconist and news-vending, and adding the sale of cooling summer drinks and multifiform walking-sticks. It is a very little place, but so scrupulously neat and clean, that you involuntarily stop to look at the wooden but lifelike representation of Mr Punch puffing a huge meerscham, the shag being symbolised by brown paint, and the incandescent ashes by glowing red tinsel; likewise at the strip of plate-glass, suspended by pink ribbons, on which are so captivatingly laid out the Taglioni pipes, saucers of different tobaccos, and genuine Varina's c'naster; at the huge Christmas cigars; at the newspapers, so artfully disposed for effect; and lastly, at the little green curtain, keeping out cold air and curiosity at the same time.

In this tiny box, 'cabined, cribbed, confined,' but yet 'gay, cheerful, and industrious,' lived Emma Norman, Mr Tappolet's niece—an orphan who, with her unmarried brother, who was engaged in the City by day, and returned at night, were the sole tenants of the house. She, or Emma, as we shall call her, was rather above the ordinary height of woman, with large, black, love-darting eyes, of which I would say, with Cowper, 'blest be the art that could immortalise them,' beautifully-arched brows, a profusion of glossy and fine black hair, neatly braided on either side of a lofty forehead, dimpled lips, teeth of perfect shape and colour, hands small and plump, and a skin of the complexion of alabaster. Her figure, shown to advantage by a dress of dark merino, close-fitting, homely in its want of ornament, and rising high to the throat, the painter's brush might convey some idea of; but our deponent steel pen never could describe these items, any more than the bewitching toss of the head, the arch and fascinating glances from under the long lashes, or the general sunny and ingenuous aspect. She bore no resemblance to the portraits of 'an English girl,' such as one sees in albums, at picture exhibitions, or in frontispieces to love-sick music. The pictured pretty faces in the Burlington and Lowther arcades would in no degree help you to a just conception of my heroine. For the rest, she was great in the manufacture of pastry; exemplary in the production of muffatees for wrists, purses, watch-pockets, and guards; untiring in glove cleaning; fond of reading

novels, Mr James's in particular; could sing 'Molly Bawn' and 'I should like to marry' unexceptionably; danced in such a way, to quote Suckling, that

'No sun upon an Easter day
Was half so fine a sight;'

and, in a word, wherever she went, made all the young men crazily in love with her, and set all the girls insanely jealous. What wonder, then, that the very policeman came here for his tobacco; that the curate regularly had his box filled from her stores of rappee; and that Mr Beggs, after closing, so regularly visited here for his five minutes' conversation and cigar, while Mr Hadnum would come alone, or with Mr Tappolet, and stay to supper? What marvel either that the Mrs Grundys of the place, intent on her affairs, endeavoured to evolve a unanimous verdict on the subject of her matrimonial intentions; or that, while one faction declared for Mr Beggs, another recorded its opinion in favour of a youngster endowed by nature with good connections, a coarse complexion, and red hair, and by art with blue spectacles, and aspirations after literary fame, and who, moreover, had published a little volume of poems, in which 'gibbous moons,' 'silvery waters,' and 'brilliant mazes of clustering stars,' were constantly introduced. No one thought of Mr Hadnum on this occasion, any more than of Uncle Tappolet; for Mr Hadnum, being only the young man, behoved of course to give place to his superiors. One might have thought, indeed, that he was Emma's young man, as well as the young man of Commerce House, he made himself so useful in one way and another; and especially in directing her taste in novel-reading, and fetching and carrying the volumes.

Novels, however, transact a good deal of business in the way of love, and there are always a few marriages at the end of them; and perhaps it was these dangerous associations which made Mr Beggs look very austere whenever Emma and the young man began to talk of Lord Reginald and Lady Wilhelmina, which they did as familiarly as if they were their first cousins. He was a great dealer himself in the fictions of trade, and the ingenuity of his plots would have made Mr James blush for himself; but he never had time to study much the productions of other masters, and perhaps, therefore, he regarded them with a little of the contempt which clever men are apt to bestow upon what does not come within the scope of their own knowledge. His remarks to his partner upon this head had some effect, and by degrees they deepened in shade, till Mr Tappolet felt nervous as he read in large letters everywhere, in passing along the street, 'Jack Shephard,' 'Eugene Aram,' and 'George Barnwell,' and saw in his own window, the first thing on coming back to business, 'Robberies by confidential young men.'

Matters were thus thrown into the state very unpleasant to Mr Hadnum, who had almost resolved upon giving warning, and advertising for a new situation; although his success would in all probability compel him to migrate far from the City Road.

'What *can* it mean?' said Emma one evening with the tears in her eyes; 'there is uncle looking at you these three weeks, as if you were an Ojibe-away; and that Mr Beggs smiling at you like any Iago, till I'm sure I creep all over!'

'It's all along of the novels,' replied Mr Hadnum moodily.

'And why, I wonder? Is a novel so much worse than a Soul-stirring Romantic Melodrama? and I know he reads them.'

'Why, how do you know that?'

'Because,' said Emma, 'I caught him in a whole line twice; and not a line of the kind one would pick up from the stage. It was in the drama written by Piccolo, the player of Ponder's End, which long ago, you may remember, we were going one night to see; only we didn't. But you bought me the work for threepence, and I keep all your things—somehow.' Mr Hadnum

was in a brown study, and in it was the 'work' in question and its author.

'Piccolo—Piccolo—Piccolo,' said he, endeavouring to grasp some idea, as Macbeth would have clutched the air-drawn dagger. 'Yes!' cried he—for now he had it—'I saw Piccolo once—he was pointed out to me on the street—and he was the very moral of Mr Beggs!' The young couple looked at one another strangely. Emma at length laughed, for she did not know what else to do; but Mr Hadnum, catching up his hat, made a hasty exit from the shop. Whither he went, how he acted, what he discovered, are the mysteries of this story; for no story is worth paper and print that does not leave something in doubt; but it will be seen that the dramatic reminiscences of our Emma had important results.

About ten days before Christmas-Day, and about eleven o'clock in the morning, an unusual stir was observable at Commerce House, where Hadnum and Mr Tappolet were talking with great energy to two ill-favoured looking men in the shop; and not a few idlers, like the chorus in Greek plays, looking on and giving advice. To put the reader in possession of the facts more quickly, and without the accumulated mass of fiction which a rolling narrative proverbially acquires—a letter had arrived for Mr Beggs, marked 'confidential' in one corner, and 'haste' in another. Immediately on glancing over it, in Hadnum's presence, Mr Beggs had betrayed great excitement; and in a quarter of an hour had hurried from the house. Shortly after his departure, two gentlemen of unpromising exterior, limbs of the law, had cleared up the mystery by their appearance in search of a man named Benson, who, under innumerable *aliases*, had committed almost numberless frauds, his appellation having, as we have seen in the present instance, been Beggs. The sheriff's officers (for such they were), who described this Chevalier d'Industrie as owing money in almost every county in England, stated that he had been 'everything by turns, and nothing long:' at one time a mesmerist professor, popular advocate, and editor of the 'Toiling Millions' Voice,' under the name of Bachoff; at another, under the name of Piccolo, an actor, whose genius had shaken the buskined stage of the Theatre-Royal, Ponder's End, for which thriving establishment he had written a drama, of which the playbill candidly stated that 'a sympathetic joy diffused itself through every bosom as the thrilling situations and effects of the author's exciting efforts drew onwards to a conclusion;' in short, a swindler equally *au fait* at a lecture on Cromwell and the Commonwealth, or a sale of depressed manufacturer's stocks at terrific prices.

Of course Mr Tappolet acquainted the officers with the circumstance of the letter, and they were soon again in pursuit of Benson. However, he was gone, and most probably not to return—so thought the tradespeople, to all of whom, with the exception of Emma, he was indebted; so thought that coarse-complexioned but gifted author, who had lent him some ten pounds, much on the Roderigo and Iago principle; and so thought Mr Tappolet, who set to work vigorously to ascertain the state of the concern. As for Hadnum, he thought nothing about the matter, for he *knew* how it would be, and so he devoted himself to taking stock, and striking balances. This occupied a day or two, but the result was more favourable than might have been anticipated; the ruinous prices and alarming sacrifices had not, it is true, brought much grist to the mill; but still the prospects of the business were just those which advertising columns daily set forth as 'capable of great extension by a persevering young man with moderate capital.' This being so, then, Mr Tappolet being desirous of retiring on his little income, and conceiving Mr Hadnum to be the persevering young man above-mentioned, and Mr Hadnum drawing out of a banker's no less a sum than one hundred and fifty pounds, which he had saved by a course of self-denial almost amounting to amateur pauperism, and increased

by judicious investment, and being willing to conduct the business on his own account, and Emma, with her uncle's cordial acquiescence, agreeing to make Edward the happiest of men—the fact will appear less surprising that Christmas-Day 184— beheld the little cigar shop let to a different business, and Mr Hadnum, Mrs Hadnum, late Miss Norman, and Mr Tappolet, all three eating their Christmas dinner in the parlour of a newly-painted shop, where the name of Hadnum was newly written up, and the distinctive feature of the beehive still remained.

Rosalind says 'men are April when they woo, December when they wed;' but seven Christmas-Days, anniversaries of their wedding, have passed over this couple's heads, and Mr Hadnum finds the wife (who has no time now to read novels) dearer, if possible, than the bride. They have two or three children of their own, and follow that

'Good old fashion when Christmas is come,
To call in all their neighbours with bagpipe and drum.'

Mr Tappolet is always present on these occasions; and on the last, delivered himself of 'a wise saw,' with which our little history shall conclude—namely, 'That popular progress, as some people regarded it, was Walk-er, and that mouths always full of the people's *cause* were to be suspected of watering at the people's *effects*.'

MEMOIRS OF SIR ROBERT MURRAY KEITH.*

SIR WALTER SCOTT, in his 'Chronicles of the Canon-gate,' has immortalised, under the name of Mrs Bethune Baliol, a charming specimen of the Scottish female aristocracy of the last century, whose actual appellation was Mrs Anne Murray Keith. The real lady had a brother, a notable person of the last age in a wider circle than that of Scottish society. Sir Robert Murray Keith had been, for the twenty years antecedent to the French Revolution, the British ambassador at Vienna; previous to which time he had served in the same capacity at Copenhagen, where it was owing to his firmness and discretion that the unfortunate Queen Matilda, sister of our George III., was rescued from the malignity of her enemies. The traditional character of the man is high for honour, spirit, and talent. He was beloved and esteemed by his sovereign; and during his long residence at one of the most elegant courts in Europe, he had endeared himself to one-half of the young aristocracy of England by his unaffectedly benevolent services and his many delightful accomplishments. When we learned, therefore, that the memoirs and correspondence of this pattern of plenipotentiaries was to be published, we prepared ourselves for a most agreeable book, and we have not been disappointed.

The chief value of it, in our opinion, lies, not in the light it reflects on history, though this is also of no small consequence, but in the new and unexpected view which it affords of a group of men whom popular chronicles and disquisitions usually present in an unfavourable light. We here find that among the statesmen of the days of Junius there were such things as honour, and even disinterestedness. It is seen that an ambassador of those days could be a perfectly upright man; that a Scotsman could be manly, generous, and enthusiastically attached to his friends. The screen is withdrawn from before many of the public men, whom the contemporary journalists were every day abusing; but it is only to show them as men acting in general under no unworthy impulses, while in their private capacity they were playful and kindly to a degree which might disarm rancorous opposition, even where it was more just. A very large portion of the first volume is de-

voted to a history of the affair of Queen Matilda, and this has a deep tragic interest of its own, though our ambassador's part in it is somehow left more obscure than could be wished.

The best of the book is to be found, we think, in the ambassador's letters to his sister Anne. A clever man writing to a very clever woman, and relating, in all the ease of unrestrained confidence, everything which came under his eye in a most refined and delightful society, the reader may readily suppose that the result is of no commonplace character. Acting as envoy at Dresden in 1769, being then a gay bachelor of thirty-nine, he thus writes—'Now I'm about it, I'll give you a little sketch of my way of living. Morning, *eight o'clock*—Dish of coffee, half a basin of tea, *billets doux*, embroiderers, toymen, and tailors. *Ten*—Business of Europe, with a little music now and then, *pour égayer les affaires*. *Twelve*—*Devoirs*, at one or other of the courts (for we have three or four). From thence to fine ladies, toilettes, and tender things. *Two*—Dine in public—three courses and a dessert; venture upon half a glass of *pure wine* to exhilarate the spirits, without hurting the complexion. *Four*—*Rendezvous*, sly visits, declarations, *éclaircissements*, &c. &c. *Six*—Politics, philosophy, and whist. *Seven*—Opera, *appartement*, or private party. A world of business; jealousies, fears, poutings, &c. After settling all these jarring interests, play a single rubber at whist, *en attendant le souper*. *Ten*—Pick the wing of a partridge, *propos galans*, scandal, and *petites chansons*. Crown the feast with a bumper of Burgundy from the fairest hand; and at twelve steal away mysteriously—*home to bed!*' The reader must not suppose from this that the ambassador was altogether a mere butterfly of high life, or tainted at all with the vices attributed to courts. He never touched cards; he consigned 'that old harriidan Etiquette, with all her trumpery, to the lowest underling of all possible devils;' and when he conceived himself ill-used either by parties at home or in the seat of his embassy, he spoke out in a tone of boldness which forms a striking contrast to his ordinary good-humour.

While at Dresden, he had frequent occasion to visit the chief of his family, the venerable ex-rebel, the Earl Marischal, who had spent half a century in exile, and was now near eighty, and converted to Whiggism. 'His taste, his ideas, and his manner of living are,' says Sir Robert, 'a mixture of Aberdeenshire and the kingdom of Valencia. . . . I had mentioned Dr Baillies to him, and begged he would send me a state of his case and infirmities, that the doctor might prescribe for him. This is a part of his answer:—"I thank you for your advice of consulting the English doctor to repair my old carcass. I have lately done so by my old coach, and it is now almost as good as new. Please, therefore, to tell the doctor that from him I expect a good repair, and shall state the case. First, he must know that the machine is the worse for wear, being near eighty years old. The reparation I propose he shall begin with is: one pair of new eyes, one pair of new ears, some improvement on the memory. When this is done, we shall ask new legs, and some change in the stomach. For the present, this first reparation will be sufficient; and we must not trouble the doctor too much at once." You see by this how easy his lordship's infirmities sit upon him; and it is really so as he says.'

A circumstance which afforded some amusement at Dresden is thus related:—"You must know that we have more pages here than any court in Christendom; all pickles! One of these little gentry, during the last fair, stood for a considerable time at a booth where toys were sold by an ill-natured old woman. His looks spoke desire, his cloth forbade credit; and the beldame told him peevishly not to take up the room of one who *might* become a buyer. The page observed that the lady had upon a shelf in her booth a pitcher filled with cream, and as all pages have packthread in their pockets, he slyly fixed one end of his clue to the handle of the pitcher, and retired grumbling to a private corner at

* Memoirs and Correspondence of Sir Robert Murray Keith, K. B., Envoy Extraordinary and Minister-Plenipotentiary at the Courts of Dresden, Copenhagen, and Vienna, from 1769 to 1792. With a Memoir of Queen Carolina Matilda of Denmark, and an Account of the Revolution there in 1772. Edited by Mrs Gillespie Smyth. 2 vols. London: Henry Colburn. 1849.

some distance. There he sat *perdue*, with his packthread in his hand, watching the moment when he could tumble down the pitcher upon the old woman's head.

'At the instant, the *Gouverneur des Pages*, a grave, sententious, leaden man, came that way, and seeing little pickle in the corner, he wisely smelt a rat. "What are you doing, you little dog?" "Nothing." "I suspect you have been pilfering: show me your hands." Behold the packthread, which the governor immediately seized. Supposing some stolen goods at the end, he pulled, and pulled; the nimble page took to his heels; down came the pitcher; out screamed the beldame, and she and twenty of her neighbours fell with tongue and nail upon old gravity, who, being caught in the very fact, was scratched and hooted out of the fair without the possibility of making a defence. If you knew the proud old fool of a governor, you would kiss the little page for his cunning!'

Having made a journey to Vienna, the ambassador described the circumstances in a letter to his father, who had once been ambassador there, and was now living in retirement at Edinburgh. 'I must tell you a little anecdote which gave me real pleasure, and took prodigiously at Vienna. The second day of my being there, I was strolling about the streets, and stopped, with a spy-glass in my hand, at the front of the Coloredo and Chancery buildings. While I looked up at the statues, an old servant (porter to Prince Coloredo) knew me at once, and stepping forward, with the kindest familiarity, and slapping me on the shoulder, said in German, "Precisely what your dear papa used to do twenty years ago!" Nothing could be more benevolent than the look with which he accompanied this, and I own I was struck with it. I mentioned the agreeable sensation it had given me in the company where I passed the evening, and next day I found the porter and I had been in the mouths of all Vienna. It is, in my opinion, no bad sign of the people of a great capital, who expressed themselves pleased with so simple an incident as this.'

After this one is not surprised to find Keith announcing his appointment as ambassador to Vienna, and his intended journey to receive the congratulations of his friends in Scotland, with this addition—'*My poor nurse must be told of my happy arrival: inquire into her situation, and let me know when and how I can mend it.*' And when he had gone to Vienna as resident minister—writing to a gentleman friend, he says, 'The first ten days of my residence here were trotted away in leaving bits of card at doors, and repeating my dancing-master's bows to crowds of people who may, in a course of years, become my friends, or at least acquaintance. I don't know how my own face looked upon these occasions, but I know that I felt pleased, as every person turned of forty said something kind about my father.'

In so many letters to friends in Scotland, there were, as might be expected, many allusions to Scotland itself and to its people, and many affectionate reminiscences of home. It is charming when the great ambassador, in the midst of details regarding continental politics and great people, raps out some homely or humorous phrase of his native land—as where he says that 'the king of Naples has delighted all Germany by his unaffected *cantiness*'—*Anglice*, cheerfulness; or remarks, that the New Town of Edinburgh being so very geometrical, 'the very *dubs* will run at right angles' (dubs being the home-phrase for puddles); or tells from Sistovo, a remote place in the domains of the sultan, that he has a score of Turkish *unco's* to relate (unco's being marvels). Having inherited from his grandmother a small property in a moorish part of Peeblesshire, he delights to speak of himself by his territorial appellation of *Murrayshall*. It is amusing to hear of what *Murrayshall* is next to do in a negotiation conducted near the shores of the Black Sea for a pacification amongst the powers of Eastern Europe. He tells Anne to have the place planted by all means: 'you shall be ranger of the

new forest in Tweeddale; and your husband, when you get one, shall be lord-warden of the marches!' Somewhat oddly, while Mr Woodfall was railing at Sir Robert as a full-fed placeman and pensioner, he was actually kept so low in pocket by the expenses of his situation at Vienna, as to be under a constant fear of having to sell this poor moorland in Tweeddale merely to keep out of debt. In his good-will to his native country, he subscribes largely to the new buildings for Edinburgh College, and only refrains from urging the same duty upon his friend, the celebrated General Loudon, who was a Scotchman at only four or five removes, from a consideration of the poor old general's poverty. As a pendant to all this, the following anecdote of a journey he made at an early period of life in France tells pleasantly:—'In passing through the noble forest of Compiègne, I took the liberty of questioning as follows my man Andrew, who is a gentleman of great sagacity:—"Pray, Andrew, saw you ever so fine a forest as the one we have come through?" "Sir," quoth Andrew, "the forest is a gay forest, but I see warrant I've seen other forests before now." "Where, Andrew? Have you anything like this in Athol?" "Ay, sir. I wish your honour had only seen the Duke of Perth's grit forest in our country! It has a hantle of fine deers in't, and Colonel Græme pays a hunder pund starling by the year just for till keep the deers frae bein' destroyed intilt." "Well, Andrew, I'm glad to hear what you say; but are the trees in that forest as fine as those we saw to-day?" "Trees, sir!" quoth Andrew: "no, sir, there's no a stannin' stick in the duke's grit forest; but it's a bonny hill and heather, like the *wood o' Mar!*" Oh patriotism, patriotism, thy errors are beautiful! I embraced my man Andrew, and we pursued our journey.'

Next to the letters to Sister Anne, we would place those which pass to and fro between the ambassador and a certain fraternity of friends, chiefly official men in London, who were designated the *Gang*, and two or three of whom seem to have been rivals to Sir Robert in gaiety of heart, humour, and unaffected, unworldly character. Thus it is, for instance, that Mr Bradshaw, a lord of the Admiralty, addresses his friend at Vienna:—'All that you love here, love, remember, and regret you. If our parties are dull, you are wished for to enliven them; if cheerful, you are longed for, that you may have your share of them. There is not a D—, or a B—, or any honest letter in the alphabet, that is not devoted to you, and would not willingly make you a partaker of our pleasures; because, by coming to claim your share, you would more than double our stock. Finish your business, obtain your well-deserved reward, and "live with us, and be our love," as the old song says.' Sir Robert, on his part, overflows with benevolent expressions towards this set of his correspondents. Amidst all the dignity and even splendour of his position abroad, he sighs like a schoolboy for the enjoyments of home: for example—'I don't know how it is, my dear friend, but the same old story which you and I talked over in a postchaise about a thousand pounds a year, a *wife* and a *farm*, is continually trilling through my brain; and I can't for the soul of me help thinking that in something of that kind consists the *summum bonum*. But mounted as I am upon the above-mentioned hobby-horse, I can, however, assure you with great truth, that whilst I am to serve my master abroad, I never can have a commission so honourable and agreeable as the one I now enjoy. I like the sovereigns I am sent to, their capital, and their subjects. There is not a happier man in all Austria than myself; yet I have a hankering after *home*, which, as it is built upon laudable motives, I cannot wish to suppress. I have often thought that not one in a hundred of you odd fellows, who wallow in the luxury of the land you live in, knows the value of the enjoyments which are within his reach. For my own part, I never think of John Bull and his *little proud island* without a singular pleasure. There is a *queerness* in John that I delight in; there is a stamp

upon him—a character—a variety—a manliness, which nothing can come up to; and then John's women are so fresh and tidy, his grass so green, his mutton and claret so good, his house so much his own, that I cannot relinquish my share of those advantages.'

This appreciation of England strikes with the less surprise when we read of the ambassador's experiences in Denmark, where, except for formal audiences and business visits, he found scarce a door open to him; or read that, even in refined Vienna, conversation was apt to be made up of commonplaces. As to Denmark, he says to his father, 'You know M—— Hall, that nasty, boggy, bare, and foggy corner of the world. If I would exchange it against some kingdoms I have seen, with the obligation of governing them, may I be hanged and dissected! I have seen more mirth at a Scotch dredgy* than ever brightened the features of the best sort of people I have seen here.' Speaking in another letter, at Vienna, of some caricatures which had been sent to him, he says—'I laughed myself black in the face at the "*Shaver* and the *Shavee*;" and my German servants, who had never heard the vulgar sound of a loud laugh, ran into the room to see what the deuce had befallen his excellency. You must know that we never laugh here beyond a gentle simper that dimples the cheek, unless when a grandee or a dear creature happens to be immoderately witty, and then we indulge them with a flying titter. They say through Europe that John Bull is a grave, morose fellow; but hang me if John does not shake his fat sides with ten times the glee that I ever saw since I left him!' On another point he compliments England with, we think, even greater truth—it is in speaking of what is to be done with the rebellious Americans:—'If I hear of a *half measure* in the next six months, I shall be sorry for it; if I could hear of a *cruel one*, I should be still more so. But there is at bottom in John Bull and all his children an innate principle of humanity which no other nation under the sun can boast of. John Bull can quarrel and box with his own brother, and give or take a black eye with every exertion of his hot-headedness; but to shake hands and be friends again, without the smallest remnant of rancour, is a species of benevolence which, as far as I know, belongs to John exclusively, and I love him for it most cordially.'

Our space forbids us to dilate farther on the merits of this charming book, except to remark that the editress, a daughter of the hero, has in general performed her task with great judgment, and in a spirit of sympathy which pleases without ever being offensive. But before concluding, we would make room for a curious anecdote of Charles Fox. 'He was under a necessity of staking L.2000 at Newmarket last Monday for some matches that were to be run that day. The twelve tribes of Israel were all tried, but their hearts were uncircumcised and hard, and he could not raise a single guinea. He declared this at White's and Almack's on the preceding Friday night; he seriously offered L.6000 at the end of six months for an immediate supply of L.3000; and at last, thinking himself sure of winning his matches, he offered L.500 for the loan of L.2000 till the following Tuesday night. No offers would tempt his friends, nor soften the hard hearts of the Jews; and poor Charles was in the last stage of distress. In this situation, with five guineas, his whole fortune, in his pocket, he came into White's an hour before dinner on Saturday; there he found Harry Cavendish (the House of Commons note-writer), with whom he began to play billiards for a guinea; and having a run of luck, he won, with the assistance of some bets, eighty-five guineas; which enabled him to go to Almack's at night, where, without losing one cast, he won L.3000! His good fortune then left him, and he lost back L.700; but he cut at three o'clock in the morning with L.2300, which enabled him to make his stakes at Newmarket. All this I know to be exactly

true. I have not heard what he did at Newmarket, but I will venture to pronounce that no lord of the treasury ever had such a practical knowledge of *circulation*, nor such extensive dealings with the *monied interest* of this country. If he escapes a pistol in a gloomy hour, when the *ways and means* are desperate, what has not this country to expect when he is at the head of its finances!'

THE THRUSH.

'Light-hearted herald of the coming spring!
To Fancy's ear, whose wildly-warbling strains
Speak of fresh foliage, emerald-tinted plains,
And flowers that all around sweet odours fling:
Of these—yea, more than these—thy glad notes bring
Fair promise; for they tell of azure skies,
Bright days, soft breezes, and the melodies
Of birds and rills, and insects' tremulous wing.
To him whose healthful frame and gladsome breast
Are yet unscathed by withering care or pain,
Thy chanting seems to say, that he again
Shall be with vernal joys and pleasures blest.
But to the victim of disease or grief
Thy spirit-soothing tale brings small relief!'

PLEASANT memories of bygone days are said to be a source of vigour to the mind—a well of contentment to their possessor. He who, when called upon to buffet with the world, can revive a bright thought, a gladsome association, feels that life is not altogether vexation of spirit—that it has some animating impulses. Among pleasant reminiscences, few are more welcome than those connected with natural objects; and many, now the denizens of populous towns, will recall a time when the music of birds afforded full scope to all their powers of enjoyment. Such at least will not be reluctant to refresh their memory—

'Hear how the bushes echo! by my life,
These birds have joyful thoughts. Think you they sing,
Like poets, from the vanity of song?
Or have they any sense of why they sing?
And would they praise the heavens for what they have?'

Of all the 'messengers of spring,' the thrush is one of the earliest to communicate his joyful thoughts in most musical language. Ornithologists describe twenty varieties of this bird proper to Europe, of which seven, and at times eight, are found in this country, comprehending the water and ring ouzel; the song and missel-thrush; the blackbird, redwing, and fieldfare: it is chiefly, however, to two of the number that we shall confine our attention. On the continent the song and missel-thrush are migratory, in common with the fieldfare and redwing; but in England they remain the whole year, giving us music when otherwise not a note would be heard. The song-thrush (*Turdus musicus*), or thrush, breeds three times in the season—in April, May, and June; but the first brood is considered the best. The nest is constructed of moss and vegetable fibres, lined with a cement of cow-dung and decayed wood, of so firm a texture as to hold water. The birds pair at the end of winter, and maintain their union for a long period with great fidelity. They are of a shy and solitary habit, and for this reason generally avoid open districts, preferring thick hedgerows, copses, and woods. Most commonly the nest is placed high up in the fork of a tree; yet, as has been remarked of even the wildest birds, a degree of tameness is induced by the season of nidification, and thrushes will then build near to public thoroughfares or human habitations, and several instances are on record of the nest being constructed within the house. A pair once built in Gray's Inn gardens but a few feet above the ground; and though close to a much-frequented thoroughfare, were apparently undisturbed by the busy traffic. Unfortunately, one day while the female was sitting, a cat climbed up and killed her. An interesting account is given in 'London's Magazine' of the constructive process as exhibited by two thrushes, who made their nest between the teeth of harrows laid up on the beams of a shed at Piltessie, Fifeshire, where several wrights were at work

* An entertainment after a funeral.

making a thrashing-machine. The birds were first observed about seven o'clock in the morning, and from the forward state of the nest, must have begun by peep of day. At noon they began to carry mud for plastering the inside, and before sunset, one of them was seen sitting, while the other continued the work of finishing the structure: the hen had been compelled to deposit an egg before the whole of the inside was plastered. When this was complete, the male took his share in the task of incubation, but for a shorter time than his mate, whom he was often seen to feed. Other eggs were laid, and the whole hatched in thirteen days. The old birds removed the empty shells, and fed the young brood on crushed snails, worms, and butterflies. As the demand for food increased, the activity of the parents became incessant; they were perpetually on the wing. One Sunday, in the absence of the workmen, a prowling boy discovered and made a prize of the nest. The honest Fifeshire artisan, who had watched the proceedings with much interest, related that 'the parents mourned about for two days: maistly the hen; and he himself couldna weel settle to his work for an hour or twa, being neither to haud nor to bind, he was sae mad at the illedeed laddie.'

The thrush has a bright and piercing eye, yet it is said to be rather a silly bird, avoiding only the most obvious dangers, and easily captured by means of springes or the pipe. It has been known to lay its eggs in the place from which its nest had been stolen the day before. Thrushes are, however, more intelligent than many of their congeners: they quickly learn to feed themselves. A young one shut up with a blackbird soon acquired the power of satisfying its own wants, and fed its companion, which otherwise would have died of starvation; and a similar case occurred where a newly-hatched thrush became nurse to a cuckoo, and laboured unceasingly to satisfy the larger bird's voracious appetite.

Wherever known, the thrush is celebrated for its song. The Germans call it *sing-drossel*, equivalent to our song-thrush or throistle. By many persons it is considered as the most musical of British birds. It commences so early in the season, as to be often heard singing while the ground is covered with frost and snow. Perched on the top of a high tree, it will sing for two or three hours together, repeating a number of short passages, which in numerous instances are beautifully true to the chromatic scale. In fact, scarcely excepting the nightingale, its notes are more varied than those of any other songster of this country. Like the nightingale, too, it is endued with the emulous spirit. A thrush had for a long time frequented a garden in Sussex, where its copious song obtained willing admiration: one day it was seen to fall suddenly in the midst of its exertions, and on being picked up, was found dead from the rupture of a bloodvessel. In May, the thrush has often been heard singing after dark, and again before two o'clock the next morning: it sings also upon the nest. Grahame conveys these characteristics in pleasing verse:—

—'The thrush's song
Is varied as his plumes; and as his plumes
Blend beauteous, each with each, so run his notes,
Smoothly, with many a happy rise and fall.
Sometimes below the never-fading leaves
Of ivy close, that overtwisting binds
Some riven rock, or nodding castle wall,
Securely there the dam sits all day long;
While from the adverse bank, on topmost shoot
Of odour-breathing birch, her mate's blithe chant
Cheers her pent hours, and makes the wild wood ring.'

The truthfulness of the poet's description will be recognised by all who are acquainted with its subject. There is something peculiarly English and inspiring in the song of the thrush, especially when heard in the silence of early morn or evening twilight, and the thoughtful listener will assent to Wordsworth's sentiment—

'And hark! how blithe the throistle sings!
He, too, is no mean preacher.'

Nor are we without evidence as to the quality of the

warbler's voice; for Browne, describing a bird's concert in his 'Pastorals,' says—

—'The thrush
Sang counter-tenor sweetly in a bush.'

The food of thrushes consists of berries, worms, insects, snails, and they exhibit extraordinary skill in breaking the shells of the latter; besides which, the fact of their breaking the hard shells of periwinkles and whelks in order to devour the occupant, is well authenticated. This habit of the birds renders them particularly useful in a garden, where they hunt for snails and worms with knowing perseverance. 'Watch an old thrush,' observes Stanley, 'pounce down upon a lawn moistened with dew or rain. At first he stands motionless, apparently thinking of nothing at all—his eye vacant, or with unmeaning gaze. Suddenly he cocks his ear on one side, makes a glancing sort of dart with his head and neck, gives perhaps one or two hops, and then stops again listening attentively, and his eyes glistening with attention and animation. His beak almost touches the ground—he draws back his head as if to make a determined peck. Again he pauses—listens again—hops perhaps once or twice, scarcely moving his position, and pecks smartly on the sod; then is once more motionless as a stuffed bird. But he knows well what he is about; for after another moment's pause, having ascertained that all is right, he pecks away with might and main, and soon draws out a fine worm, which his keen sense of hearing had informed him was not far off, and which his hops and previous peckings had attracted to the surface to escape the approach of what the poor worm thought might be his underground enemy—the mole.'

Doubtless what have been considered as mischievous and destructive propensities on the part of the thrush, would be proved, on correct observation—as in the case of most other birds—to be rather a persevering and beneficial warfare against the countless tribes of minor hurtful creatures. At all events we may afford to listen to their expostulation, as stated in 'Jennings's Ornithology':—

'How is it that the good we do
Is kept most carefully from view?
We hear not of the many seeds
Which we devour of noxious weeds;
Of worms and grubs, destructive things,
That each of us his offspring brings.
What though we snatch a feed of corn
Or ere it's safe in yonder barn,
Yet is there not enough beside
For MAN and his consummate pride?'

The different kinds of thrushes were greatly esteemed by the Romans, who kept thousands of these birds, together with quails and ortolans, in huge aviaries or voleries, where they were fattened for sale. These structures were traversed by numerous perches, and trees and turf so disposed about them, as to cheat the captives into a belief that they were in their native woods; and a small clear stream of water was constantly running in a channel along the floor, to furnish the means of drinking and bathing. The famed Lucullus had one of these aviaries so constructed with glazed sides around a dining-hall, that his guests could see flying about in their natural state the same kinds of birds as those eaten at the extravagant repasts. The stock of thrushes was kept up by renewed captures, as it is said they did not lay while imprisoned. They yielded, however, a large profit to their owners, the demand being such for the luxurious feasts of the Romans, that 1s. 3d. each was a common price for the birds. Martial gives the first place among meats to the flesh of thrushes; and on account of the succulence of their flesh, the songsters were often used in the stuffing of roasted pigs, a dish greatly relished by the imperial citizens. Tiberius once gave 40,000 sesterces to a writer who had composed a dialogue in which a mushroom, becafico, oyster, and thrush contended for the pre-eminence. According to Pliny, a thrush roasted with myrtle berries was a specific for dysentery; ma-

cerated two days in vinegar, the flesh was administered as a cure for the plague; while the gall was held to be remedial in white leprosy and skin diseases generally. But to quit these medicinal errors, it is certain that, for persons of weakened digestion, the flesh of thrushes, including the fieldfare and redwing, is particularly restorative, as conveying stimulating and exciting properties into the system in a small volume.

Thrushes are found all over Europe, but appear to be most abundant in northern countries, not excepting Lapland and Siberia. They are so numerous in Poland, as to be exported in boat-loads at a time from certain provinces of that country. They migrate on the approach of winter, and arrive in vast numbers on the southern shore of the Baltic. Klein states that 90,000 pairs are consumed annually in the city of Dantzic! They swarm also in the forests of Silesia, and furnish the inhabitants with an ample supply of food from one season to another; it being the custom to preserve the birds, partly roasted, in vinegar. In France and Germany the bird is called the wine-thrush, on account of its frequenting the vineyards, and devouring large quantities of grapes during *vendange*, or the grape-harvest. It speedily becomes fat, and is much sought after at this season. At times, indeed, it appears to be intoxicated with the luscious food, a phenomenon which in Bourgogne and other places has given rise to the phrase 'drunk as a thrush.'

According to Bechstein, the thrush requires a large cage, on account of its vivacity, and is best provided for when at one end of a room enclosed by a screen of wires. In this way it will live for ten or twelve years. Sonnini mentions one belonging to a lady that lived for eight years, and in each year consumed fifty-two pounds of bread-crumbs mixed with rape-seed. This bird had learned to whistle several airs in a very agreeable manner; it was subject to occasional fits of gout, and at last died from accident. The writer first quoted says that the best method of catching a fine male is to use a perch with a limed twig: water-traps are also employed in September and October, as the birds delight in bathing. 'When they enter the water, haste must be avoided, because they like to bathe in company, and assemble sometimes to the number of ten or twelve at once, by means of a particular call. The first which finds a convenient stream, and wishes to go to it, cries in a tone of surprise or joy—*sik, sik, sik, siki, tsac, tsac, tsac*; immediately all the neighbourhood reply together, and repair to the place: they enter the bath, however, with much circumspection, and seldom venture till they have seen a redbreast bathe without danger; but the first which ventures is soon followed by the others, and if the place is not large enough to accommodate all the bathers, they begin to quarrel.'

The habits of the missel-thrush (*Turdus viscivorus*) are very similar to those of the song-thrush; it is, however, bolder, and less easily snared. This bird, it is said, is so named because it 'missels' or soils its feet with the viscid slimy juice of mistletoe berries, on which it occasionally feeds. But figs and olives, beechmast, juniper and ivy berries, are much sought after by the bird in their respective climates; and in winter it eats holly berries; and selecting a particular tree, contends resolutely for exclusive possession. The missel-thrush builds in lofty situations, and is equally early with the *Turdus musicus* in commencing its song. Although said by some to be a mere repeater of four set notes, its song is very musical; and even in the stormy gales of March it may be heard piping away for hours at a time. Thirty years ago, this bird was not to be found in Ayrshire; but from some unexplained cause, it is now common in that county, where its song is considered a sure presage of a fall in the barometer. This supposed predictive faculty has obtained for it the name of 'Storm-cock,' and, as a writer observes in the 'Journal of a Naturalist,' not without reason; for 'the approach of a sleety snow-storm, following a deceitful gleam in spring, is always announced to us by the loud untuneful

voice of the missel-thrush, as it takes its stand on some tall tree, like an enchanter calling up the gale.' He can fight as well as sing: Le Vaillant says he once saw an osprey vanquished by ten missel-thrushes in the neighbourhood of Paris; and Gilbert White states that 'the Welsh call it *pen y llwyn*, "the head or master of the coppice." He suffers no magpie, jay, or blackbird to enter the garden where he haunts; and is for the time a good guard to the new-sown legumens. In general, he is very successful in the defence of his family. But once I observed in my garden that several magpies came determined to storm the nest of a missel-thrush: the parents defended their mansion with great vigour, and fought resolutely *pro aris et focis*: but numbers at last prevailed; they tore the nest to pieces, and swallowed the young alive.' There is a variety in the United States known as the wood-thrush (*Turdus melodus*), which possesses many qualities in common with the European tribes, and is an interesting exception to the general unmusical denizens of American forests. 'The prelude to its song,' observes Nuttall, 'resembles almost the double-tonguing of the flute, blended with a tinkling, shrill, and solemn warble, which re-echoes from his solitary retreat like the dirge of some sad recluse, who shuns the busy haunts of life. The whole air consists usually of four parts or bars, which succeed in deliberate time, and finally blend together in impressive and soothing harmony, becoming more mellow and sweet at every repetition. Rival performers seem to challenge each other from various parts of the wood, vying for the favour of their mates, with sympathetic responses and softer tones; and some, waging a jealous strife, terminate the warm dispute by an appeal to combat and violence. . . . In dark and gloomy weather, when other birds are sheltered and silent, the clear notes of the wood-thrush are heard through the dropping woods from dawn to dusk; so that the sadder the day, the sweeter and more constant is his song.'

With his loving spirit and truthful ear for natural music, old Izaak Walton could well appreciate the 'throssel's' melody; and he expatiates on it eloquently, yet reverently. And here, with a sonnet to the welcome vocalist, we may appropriately bring our jottings to a close:—

'A flute-like melody is thine, oh thrush!
Full of rich cadences, and clear and deep:
Upon the sense it cometh like a gush
Of perfume stolen by the winds that sweep
Where spice-isles gem the bosom of the deep.
At early morn, and 'mid the eve-tide's hush,
Pouring thy mellow music, thou dost peep
From out the lilac-tree or hawthorn bush.
I love thee for the love thou bear'st the lowly:
The cottage garden is thy favourite haunt;
And in those hours so calm, so pure, so holy,
It ever is thy pleasure forth to chant
Those blithsome peans, seeming, as it were,
Thy wish to make all happy dwelling there.'

SKETCHES OF THE HISTORY OF EDUCATION.*

COMENIUS.

NONE of the early reformers of education is entitled to more notice than John Amos Comenius, who was born at Comnia, in Moravia, in 1592. His parents belonged to the sect of the Moravian brethren, and he himself was pastor at Fulnek, the head-quarters of that body, until driven from his native country by the imperial edict of 1624, exiling all Protestant clergymen. From that period he led a wandering life. Sought after by the governments of England, Sweden, and Transylvania, to assist in the reform of education, he passed some time in each of those countries; and driven from several of the stations at which he had settled by the ravages of the war which then desolated Europe, he at last found refuge in Holland,

* The preceding article under this head appeared in No. 263, containing an account of the educational views of Raticch.

and died at Amsterdam in 1671. At an early age he dedicated himself to the improvement of education; and during the whole of his long and anxious life, in spite of all the losses and disappointments to which he was subjected, he laboured for this darling object. He was not one of those who content themselves with partial attempts at improvement, and seek for a complete remedy by opposing or advocating this or that particular method; but he was, in the best sense of the word, universal; and yet, with this universality, he was not superficial, but strove for an absolute and radical reform. 'All,' says he, 'must be educated; rich and poor, boys and girls; and all must learn everything. Not that each of them can be grounded in every science; but all—since it is the mission of all to be not merely spectators, but actors in this world—must be taught to mark the reasons, relations, and objects of everything of importance. At present we never teach realities, but instead of them, spend fifteen or twenty years in teaching Latin, and yet make nothing of it.' Comenius's principle was, that all useful knowledge was to be imparted to his scholars; but then he was not to follow the system of the generality of the teachers of his time, who graft in plants instead of sowing the seeds of plants; and instead of giving their pupils simple principles, carry them at once into a chaos of books and perplexing exercises.

His abstract theory of instruction is as follows:—'We must first exercise the senses, then the memory, thereafter the understanding, last of all the judgment. For knowledge begins with the appreciation by the senses, which, through the imagination, is borne in upon the memory; then the understanding, by a process of induction applied to the observation of individual objects, realises universal truths, and finally certain knowledge results from the judgment exercised upon that which is sufficiently understood. Nothing, therefore, is to be taught by rote which has not been thoroughly comprehended. That which is appreciated by the senses sticks fastest to the memory, and therefore the use of pictures is much to be recommended. On the same principle every branch of knowledge is to be taught by actual practice: the art of writing, by practice in writing; singing, by practice in singing, &c. The master must commence by giving a specimen for imitation by the pupil, without wearying him by theoretical instructions.'

In the same style Comenius, as a true disciple of Bacon, goes on to enlarge upon the inutility of merely theoretical study. 'For,' says he, 'do we not dwell, as our first parents did, in the garden of nature? Why, then, should we not make use of our eyes, and ears, and noses, as they did? Why should we seek for a knowledge of the works of nature by means of other teachers than our own senses? Why should we not, instead of dead books, open the living volume of nature, in which there is far more to observe than any books can repeat to us, whilst the very observation brings of itself more delight and richer fruit than is to be found in them. The schools formerly did little more than teach the pupil, like the daw in the fable, to dress himself in borrowed feathers. They showed him, not things themselves, as they are in themselves, but imparted to him what was thought or said of the same by this man or the other, so that the proof of the greatest learning was to be able to remember the contradictory opinions of various authors on various subjects. In this way it came to pass that the greater number did nothing more than extract certain phrases, sentences,

and opinions out of various authors, and string them together like a piece of patchwork . . . Man should seek for knowledge not from books, but from observation of the heavens and the earth, trees and plants—that is to say, he must know and inform himself about things themselves, and not merely learn what others say of them. Instruction must not commence by a verbal exposition of things, but by a visual observation of them; and then, after the inspection of the thing itself, the verbal exposition should follow. He who has once seen a body dissected, will understand the anatomy of the human body far better than he who has read the most admirable treatises on anatomy without dissection.'

With these views, Comenius began with education at the very beginning, dividing his course of instruction into three stages, of which the first was the mother-school—that is, the education at the mother's knee. During this period the child is to be instructed in the first principles of morals and religion. Many rules are laid down as to diet, exercise, &c.; and he is to commence his study of the sciences—as, for instance, astronomy—by being taught the names of the sun and stars, and being led to observe the increase and decrease of the moon; and geography begins with an acquaintance with the localities of the house, the roads, and the fields, &c. At six years old the child is taken to the German school, for the mother-tongue is to be taught before adventuring on any other. Here he is taught to read, write, reckon, and the elements of general history. The school is to be divided into six classes, for each of which a class-book in the mother-tongue is to be provided. From this the pupil rises to the Latin school, where he is instructed in grammar, physics, mathematics, dialectics, &c., and so on to the highest branches of learning.

Comenius's principle, then, was—literally, and only too literally—that everything within the circle of human knowledge was to be brought under the view of his pupils. Education was not to be restricted, as formerly, to the learning of certain languages and sciences, but was to be extended to a comprehensive survey of all that is, and passes around us, to an acquaintance with the habits and customs of men, their occupations and trades, natural and mental science. Thus, also, his system embraced the training of the body as well as the mind, the moral as well as the intellectual faculties. As a specimen of the universality of his views, it may be mentioned that his academical plan included the supervision of the sports of the pupils, and that a certain time in each week was set apart for the reading of the public journals, in order to impart a knowledge of what was passing in the political world.

The reader will now have a general idea of what Comenius meant when he said that everything ought to be taught, and to be taught by experiment; but the best mode of conveying a thorough understanding of his system will be to give a short account of some of the many books composed by him for the use of schools. The fundamental principle of these books is, that the learning of languages, especially of Latin, should go hand in hand with the teaching of things as designed and explained by means of the language. 'The schools,' says he, 'proceed on an erroneous principle in teaching language first, and then proceeding to things; the pupils are busied for several years with the study of language and the knowledge thereto appertaining, and then for the first time they are presented with realities, such as mathematics, physics, &c. And yet things are the substance, words only the accident—things are the body, words the clothing. Things and words should therefore be taught at the same time; but things above all, as being the object of the understanding and the language.' And he then proceeds, almost in Ratch's words:—'In teaching language, it is wrong to commence with the grammar, instead of beginning with some author or schoolbook, since the book furnishes the material of the language, and the form will be sup-
